Modern science, though it has vastly increased our knowledge of detail and greatly extended our resources, has not been able to lay down for us, nor is she likely to do so, any better guiding principles than our forefathers had of altering our tactics according as it is growth or maturation we are trying to promote. Our modern improvements, our cucumber growing by express, our rapid Pine culture, show that we know better how to apply the principles of action than our forefathers did, and assuredly we have better means of doing so, but the principles themselves remain and will remain. It is by their study and by their careful adaptation to particular cases and varying conditions that we shall solve the problem of how and when to prune, the allusion to which has suggested these remarks. But assuredly there will be no royal road in the future whatever advance we make. Circumstances and conditions will always vary to the end of time, and our knowledge and our power to use it will be as severely tested in the future, whatever progress we make, as in the past. This hopeful progress in these matters is the great joy and encouragement of the cultivator amid his many discouragements. "The scientific gardening of the future may," as was well said recently in our columns by an excellent gardener and an eminent physiologist, "be a long time coming; but come it will; and each of us can hasten its advent by careful observation, intelligent trials, and conscientious reflection."

— MENTHON AND ITS GARDENS. — The visit of our QUEEN to this terrestrial paradise would have been very incomplete had it not included repeated visits to the gardens of our excellent friends and renowned gardeners Dr. BENNET and Mr. HANBURY. At various times it has been our privilege to inspect these gardens, and to chronicle our impressions of their contents, and the skill, patience, and knowledge which have got together such collections in such lovely spots. We have also on several occasions been enabled to lay before our readers illustrations of gardening on the Riviera. Only recently we gave a double page illustration showing what has been done at Monte Carlo, and now we are enabled to give, in addition to our previous woodcuts, another of Mr. HANBURY's garden, just across the Italian frontier (p. 501), taken from the opposite point of view from that before given (1874, vol. ii., p. 35).

We need now add no more to what we then said, than cite what Canon HALE says in his recently published pleasant work, *Nice and Her Neighbours*, wherein he tells us he saw, "Mr. HANBURY's famous gardens, and therein the grandest Agaves which we saw in France [Italy]—*picta*, with leaves 7 feet in length; *applanata*, *striata*, and other varieties, one of which had borne 1000 flowers! With these were countless specimens of trees and plants, rare and beautiful, ornamental, useful, and grotesque; the *Casuarina quadrivalvis*, with leaves like the feathers of its namesake, the Cassowary (1), *Pereskia subulata*, a Cactus with woody branches, *Raphiolepis salicifolia*, *Euphorbia abyssinica*, 15 feet in height; giant *Ferulas* in bloom, and *Opuntias* in fruit; and of flowers, the fragrant *Stauntonia latifolia* (introduced by Sir GEORGE STAUNTON, from China), the *Echium fruticosum*, with great blue spikes like a Delphinium; exquisite specimens of the single Banksian Rose, &c. We saw, but needed not to taste, the *Catha edulis*, which the Arabs used before the introduction of Coffee as a cure for drowsiness, and, as they said, for low spirits also; for we were enlivened both by *caffé* and cheerful converse in Mr. HANBURY's charming home, by that kindly welcome which all true lovers of a garden know so well how to give and to enjoy."

— TELEOPA SPECIOSISSIMA. — Mr. GREEN is to be congratulated on flowering this very noble Protead, the Waratah of New South Wales. It has long been in cultivation, but has flowered only at long intervals. Those who on Tuesday last saw the glorious spike from Pendell Court will long to try their hands also. Mr. GREEN grows it in a cool stove, gives it abundance of water when making its growth, and secures as perfect a rest and consolidation for it in winter as possible by keeping it very dry. It is lamentable to think of the glorious Banksias and plants of like affinity that our forefathers used to grow, but which we so seldom see now. Their old hot and dry stoves suited these plants better than the moister atmosphere which we with our better glazing and constant damping down secure. We hope shortly to give an illustration of Mr. GREEN's specimen, hner than any figured hitherto, and finer, as we learn from those who have seen it native in the vicinity of Sydney, than under natural conditions. Gardeners do not like to give room—indeed, cannot do so—to things of this character that take up much room and are shy bloomers; but the latter tendency is one the gardener should take pride in correcting. It is noteworthy that two such glorious plants as the Teleopa and the Doryanthes should have bloomed simultaneously, and been shown at two successive meetings of the Royal Horticultural Society.

— LINNÆAN SOCIETY MEETING. — The following papers are to be read on Thursday, April 20, at 8 P.M.:—1. "Male Pterisporian Organs Ancillary to Generation in Butterflies;" by P. H. Gosse. 2. "Himalayan Alge;" by Professor DICKIE. 3. "New Varieties of Sugar-cane by Planting in Apposition;" by Baron DE VILLA FRANCA and Dr. GLASS.

— EARLY-FLOWERING SPIRÆAS. — One of the prettiest and most desirable of these handsome ornamental shrubs is the pretty little Japanese *S. Thunbergii*, with its clusters of starry white blossoms. It makes an excellent plant for growing in pots for window or cool conservatory decoration, and bears slight forcing well. According to STEB. and ZUCC., *Flora Japonica*, it grows in such abundance on the mountain slopes and high valleys in Japan as to clothe whole sites with a snowy mantle; this has earned it the Japanese name of "Snow Willow." *S. prunifolia* is another desirable Japanese species which has been known in gardens for some time; its pretty double white blossoms are borne in clusters along the slender twigs, and open before the leaves are fully developed. The single form is unknown in cultivation, in spite of the fact that the name *S. prunifolia* flore simplex appears in some Continental catalogues. *S. confusa*, a native of Southern Russia, produces freely, in company with the two previously-named species, corymbs of rather large white blossoms. It is one of the most desirable of hardy early spring-flowering shrubs.

— MUSHROOMS. — A curious matter has lately been brought before us which, perhaps, would scarcely be worth notice if it did not give occasion to

say a word about a circumstance lately noticed in the *Gardeners' Chronicle*. A well known person writes that some twenty-five years ago, when there was an extraordinary growth of Mushrooms, he feasted on them at all meals, and was in the habit of picking them up as he walked in the country and eating them raw. WILDENOW long since proved that this may be done for some weeks with perfect impunity, if they are eaten with the coarse bread of the country, which ensures a proper mastication. It does not

though there is high probability that such may be the case. BREFFELD has shown that not only spores of Coprini may germinate and produce perfect plants in the laboratory, but that fragments of the stem and pileus may produce secondary pilei. There is, however, no instance of anything of this kind taking place within the human frame. In the medical jurisdiction case at Bury St. Edmunds it was proved, in a case of supposed poisoning, that what were supposed to be germinating fungi were in reality nothing more

severe winters, prior to which they produced heavy crops annually. They are planted in a sheltered situation, having a range of offices upon one side and a brick wall upon the other. To a stranger not knowing the climate the sight of such a row of Fig trees in fruit in the open air creates a feeling of surprise, but in South Devon a heavy crop is looked for as a matter of course. It is worthy of remark that the Black Ischia is far more prolific at Powderham than the Brunswick, which is everybody's favourite

FIG. 79.—MR. HANBURY'S GARDEN AT LA MORTOLA, MENTONE. (SEE P. 500.)

appear that any such precaution was taken, and therefore we are not surprised that our authority was one day seized with violent pain, accompanied by all sorts of miseries, which it is not necessary to give in detail. But eventually a tough fibrous substance, 5 inches in length, was passed, which was believed to have arisen from germinating spores [or more probably exfoliation from the lining membrane of the bowel? ED.] It is doubtful whether even the spores of the common Mushroom can pass through the intestines in a condition to germinate,

than little lumps of chalk derived from chalk mixture. In the case of those flies which live largely on spores of fungi or pollen grains, what are found externally almost intact are quite void of protoplasm or endochrome, all having passed away in the process of digestion. *M. 7. D.*

— STANDARD FIG TREES.—The standard Fig trees at Powderham Castle, the seat of the Earl of DEVON, are remarkably fruitful this season, and are fast recovering from the injury sustained in the late

farther north. The wood is much smaller, and at a rough calculation it is not much wider of the mark to say that the ratio in which the two varieties yield fruit would be as three of the former is to one of the latter.

— TROPÆOLUM TRICOLORUM GRANDIFLORUM.—A plant in the cultivation of which Mr. AYSON, of Oxtou Hall, Devonshire, has achieved remarkable success this season, is that above mentioned. The conservatory at Oxtou contains many specimens of them trained in many ways, but all of them in perfect

health, and a living mass of their bell-shaped flowers droops gracefully below the foliage. To repeat that they are more than ordinarily well cultivated is not saying a word too much in their praise, and the care bestowed upon the training of them seems quite equal to the pains taken in their cultivation. But after all, a plant or two trailing in a natural way over one or two branches, and relegated to an obscure position in a vinery, took the writer's eye, who, while not despising a trained specimen, gives preference to Nature's method of training creeping plants.

— THE OOO AGAIN.—The average percentage of seed that may be expected to germinate, or rather the percentage that constitutes "first-class growth," received a somewhat wide interpretation the other day in Edinburgh, according to a report in the *North British Agriculturist*. "First-class" growth seems to imply, in the opinion of some dealers, a growth from 60 to 70 per cent. Others fix 52 to 92 per cent., while, in 1880, the best class of Turnip seed supplied by growers ranged from 90 to 96 per cent. It is clear that, quite apart from the intentional admixture of dead seed for the purposes of equalising the percentage growth of one year with that of another, some allowance ought to be made for imperfectly ripened seed which might be included in a sample without any intention to deceive or regulate samples.

— "PLANTER AND FARMER."—A monthly journal under this title has just been started at Brisbane, Queensland, devoted to the interests of tropical and semi-tropical agriculture. Matter or "copy" is evidently not wanting to the new venture, as the opening sentences of the first paragraph convey an impression that an article on the milk trade has been "held over." Wood engravers are few in the colonies, we are told, in Brisbane there is not one—a hint to somebody. It is serious to read of the spread of the *Phylloxera* in the Geelong district of Victoria.

— LEAFY-FLOWERED PRIMROSES.—A not unfrequent malformation in Primroses of various kinds is the presence of a leafy calyx. It occurs now and then in the common Primrose, frequently in the Chinese Primrose, rarely in the Cyclamen. Now we have before us a plate in the last number of the *Botanical Magazine* of an *Androsace* in a similar condition. The plant is *A. rotundifolia* var. *macrocalyx*. The tuft of leaves at the base of the umbel and the leafy calyx beguiling the rose-coloured flower is very pretty and effective, though not to the taste of the specialist we fear.

— RHODODENDRON BAREBATH.—In the garden of JOHN STEWART, Esq., Secretary of the Royal Caledonian Horticultural Society, at Glensack, Musselburgh, there is a fine plant of this species now in bloom with seventy-three trusses of flowers on it.

— MAGNOLIA GRANDIFLORA.—A Pontypool correspondent informs us that he cut a fully expanded bloom of *Magnolia grandiflora* on the 10th inst.

— RHODORA CANADENSIS.—The umbel-like clusters of showy rose-purple blossoms clothing the leafless bushes of this handsome shrub during early spring render it a desirable occupant of the shrubbery border. The species requires for its successful management a damp peat border. In GRAY'S *Manual* a white-flowered form is mentioned. Is this in cultivation in this country? The purple-flowered type was introduced from Newfoundland by Sir JOSEPH BANKS in 1767.

— RIBES SPECIOSUM.—A very pretty wall plant is this Ribes, chaste in appearance, and of compact habit. It makes a striking object where it succeeds well, as it does at Powderham Castle in a north-east aspect facing the sea. The plant is trained against the wall of the Castle. It has leaves like the Gooseberry, and yields numbers of miniature scarlet flowers, not unlike some of the old type of Fuchsias, but smaller. In a more sheltered situation and better aspect it would no doubt make a beautiful and interesting plant for covering low walls.

— THE COLOUR OF FLOWERS AND LIGHT.—The specimen of Hyacinth shown to the Scientific Committee by Mr. SMEE on Tuesday last is noteworthy as illustrating a point in the physiology of plants. A Hyacinth had been accidentally placed in

complete obscurity, with the result that the leaves were blanched, but the flowers preserved their deep blue colour. Light is essential to the formation of leaf-green (chlorophyll), but not of the colours of flowers. It should, however, be remembered that the bulb contained within itself a store of food available for the production of colour, and this food could not have been stored up except for previous exposure to light.

— THE BANK HOLIDAY.—Kew Gardens were visited on Monday by 56,600 persons; and the Royal Horticultural Society's Garden at South Kensington by 8000, the latter showing a falling off of 4000 as compared with last year.

— THE COLLECTIONS OF HARDY AND EXOTIC FERNS in the York Nurseries of Messrs. BACKHOUSE are very select and extensive—some of the New Holland Ferns, especially Dicksonias, being very remarkable. *D. chrysotricha* is very distinct and well adapted for large conservatories. The fronds are very broad, the midrib being thickly studded with yellowish hairs. *D. fibrosa* is also a desirable species. *Gleichenias* are very well grown. *G. Mendelii* being one of the best. *G. polyodioides* is a new species, and very distinct. The fronds are of a lively green colour, slightly glaucous; the plant succeeds better on blocks than grown in pots in the usual way. Amongst hardy Ferns *Adiantum Capillus-veneris cornutiense* is a very elegant form, of free growth. It may almost be described as a greenhouse variety of *Adiantum farleyense*, as the fronds so very much resemble those of that fine Fern, the pinnae not being quite so broad or so fragile.

— ANTHURIUM ANDREANUM is grown well in the York Nurseries. The plants are rather more freely exposed to the sun than is usual, and besides this they are planted so that the plant may attach itself to an old tree Fern stump, which it speedily does, the roots running up to the top of the stump and down the other side.

— MR. KING, late gardener to GEORGE SIMPSON, Esq., Wray Park, Reigate, has, we hear, taken a place at Rowham, near Aylesbury, with the intention of establishing himself there as a grower of choice seeds—a line of business in which such an enthusiastic and successful hybridist should surely meet with success.

— MENZIESIA EMPETRIFORMIS.—The genus *Menziesia* was named by Sir J. SMITH in compliment to ARCHIBALD MENZIES, the companion of Captain VANCOUVER in his voyage round the world—"one of the most excellent of men and the most liberal of botanists." According to the *Botanical Magazine*, tab. 3176, this plant was first raised in Britain in the Botanic Garden at Edinburgh from seeds collected by DRUMMOND on the Rocky Mountains more than fifty years ago. It first flowered in this country in 1831. This handsome little Heathwort is now blooming finely at Kew, and as a rock plant or as a member of the peat border there are few more desirable things. It does not, however, appear to differ from our own native species, the extremely rare *Menziesia coerulesca*—now quoted in British Floras under the name of *Phyllodoce coerulesca*—which, although found in Scandinavia, mountains of Western France, Pyrenees, and from Siberia to Kamtschatka, is confined in Britain to the Sow of Athol, in Perthshire, at an elevation of 2700 feet above sea-level. The nodding urn-shaped purplish corollas are produced in clusters at the tips of the short branches.

— VINCA VARIEGATA AS A BORDER PLANT.—No more useful or striking plant can be desired at this season than the subject of this notice, which, when grown in a clear open situation, is beautifully variegated and produces a profusion of azure-blue flowers, which contrast agreeably with the silvery markings of the leaves. "One of the best things out to cut from in winter," said a gardener the other day who occupies an important position, and who grows flowers extensively for cutting every day in the year. Its bright silvery shoots go well with green of any kind, and you can cut and come again, for plants grow so rapidly almost anywhere that you may cut as much and as often as you please. Continuing the conversation, the same cultivator remarked,—"I obtained a plant or two of it out of a cottage garden a few years

ago and now would not be without it." You can compare it with any other plant in the border, and judge fairly as to general merit and usefulness it will hold its own with any of them. When it is grown stubby, every shoot being rigid and self-supporting, and clothed with flowers in the manner referred to, it makes indeed a pretty border plant. A bed or mass of it would look even better, and owners of small gardens should not ignore it, because it is not difficult to grow and only costs a trifle to purchase it.

— NIPHON CAUCASICUM.—This species, which is a native of the Caucasus and Northern Persia, was figured long ago in SWEET'S *Flower Garden*. It was then spoken of as being very rare, and in a short time afterwards it seems to have disappeared from cultivation. A few years ago it was reintroduced, and in the Iris collection at Kew it is now in flower. It is a pretty plant, about a foot in height, with glaucous green leaves and yellow flowers.

— EUPHORBIA PALUSTRIS.—As a border plant or as a subject for the wild garden this handsome perennial Spurgewort may be trusted to take care of itself. It is, moreover, an early flowering species, and its large soft yellow-green bracts and leaves make a fine show when set off with a background of dark green. It was cultivated by old GERARD nearly three centuries ago.

— DEUTZIA CRENATA FL.-FL.—This charming hardy shrub, which grows to an immense size near the seacoast in Devonshire, is one of the best of plants for indoor decorative purposes during the months of March and April. It requires little more than the shelter of a glasshouse to bring it into flower early in the present month, indeed the plant dislikes to be hurried too quickly into flower, but brought forward quietly and arranged in conjunction with scarlet *Azaleas* the effect is delightful. Perhaps spring flowers, after all, are the most effective of all, for purity and distinctness of colour rivet attention when a mere glare only catches the eye for a moment. A tall plant or two of this *Deutzia* worked in as a background one never tires looking at if its associates are rightly selected. The flowers are as delicate in appearance as they are graceful in habit, and if the plant is tilted at the back just a little an improvement upon Nature is thereby effected.

— HARDY PLANTS AT CHISWICK.—Mr. BARON is evidently determined that the Chiswick Gardens shall never be without matters of interest, let the season be what it may; and lovers of hardy flowers are sure to be interested at this period of the year. *Puschkinia scilloides* is a very pretty dwarf Scilla-like plant, bearing racemes of flowers eight or ten on a stem, the blossoms something like those of an Allium. It has done well in the open border on the north side of the large vinery, where huge clumps of the spring Snowflake are flowering grandly. These clumps have established themselves, and are now blooming with great freedom. Clumps of *Narcissus odoratus rugulosus*, known in the trade as the *Campernelle Jonquil*, are also flowering nicely, some of the stems carrying only one, others two and three flowers of a very pleasing golden hue. It also makes a good pot subject. On the rockwork and also in beds the charming little *Erica mediterranea alba* is quite an alluring subject. Mr. ANTHONY WATERER once described this as the best of all the spring-bedding plants, and he was not wide of the truth. What delicious little tufts it makes! *E. herbacea*, with its rose-coloured flowers, is a little earlier, and is very pretty also. *E. mediterranea* appears to be a little later in flowering than the white variety. *Saxifraga retusa*, with its rosy-pink flowers, is also very attractive on the rockwork, and has a compact growth; it is also a charming subject for pot culture. *Anemone apennina* is flowering freely on the rockwork; the blossoms have a shade of mauve peculiarly their own. The pretty little *Narcissus rupicola*, from the Escorial, has very pretty yellow flowers, and is quite a precious floral gem. *Chionodoxa Lucilliae* on the open rockwork has spikes of from seven to ten flowers, and when the plants become thoroughly established even larger spikes may be forthcoming. The *Epimediums*, and especially the yellow-flowered varieties, are getting very attractive; and on the summits of the rockwork the double Periwinkle is blooming freely. *Androsace carnea* in pots is very pretty, its pale pink flowers are freely borne on minute tufts of plants. *Iberis saxatilis*, from the mountains above

Greece, with its dwarf growth and trusses of small white flowers, is in marked contrast to the giant-like *I. gibraltarica* by its side, that is now fast expanding its large fleshy pink blossoms. *Myosotis dissitiflora* splendens, from Kew, is well named, the flowers being very large and of a rich pale blue. *Aubrieta violacea* is very good, giving quite a lively violet tint among these useful rock plants. *Anemone ranunculoides* may be best described as a charming yellow form of *A. nemorosa*, the colour good, and it should be associated with *A. nemorosa* in semi-wild places. In the open border the golden-leaved variety of *Valeriana Phu* has taken on a charming colour, and it promises to become a very useful hardy spring-leaving plant. Very soon there will be quite a display of the leading new varieties of *Primula Sieboldii*, that have been introduced of late, and these will afford a good opportunity for comparison and selection. *Primula rosea* is in good form, the colours of some of the flowers quite deep, and nearly approaching red shades. It is a very pretty pot subject, coming into flower with *P. purpurea*, *P. intermedia*, *P. marginata*, and others. *P. cashmeriana* is a little disappointing, as it certainly falls below the improved varieties of *P. denticulata* in point of effectiveness, but its mealed foliage and flowerstalks give it a distinctive appearance. The cold frames are replete with interesting subjects, and every day something worthy of attention attracts the eye. The general condition and health of the plants in all departments is worthy of high commendation, the only regret is that so many commonplace plants are of necessity grown to furnish the conservatory at Kensington or for distribution. Under happier circumstances the aim should be to grow what cannot be seen elsewhere, and to test the value of little known or new plants.

— THE HORTICULTURE OF BOSTON.—Colonel WILDER sends us an essay on the rise and progress of horticulture in and near the famous Massachusetts city. As a bit of history—a record of progress—it is very interesting and very satisfactory, while as a literary production it is marked by all the enthusiasm and grace of style which characterise the writings of the venerable horticulturist. Incidentally we are told that the States now number nearly 2000 societies all actively engaged in promoting the cultivation of the soil, and in the enrichment of its products. "Fifty years ago," says the writer, "the products of our soil were scarcely thought worthy of a place in the statistics of our country. Now our exports of these amount to nearly 600,000,000 dollars annually, and our Western granaries are treasure-houses upon which the world may draw to supply deficiencies elsewhere. Then the supply of fruits in our market, excepting Apples, was limited to a few varieties, and to a few weeks of use. Now our markets abound with fruits for all seasons of the year. Then almost the only Strawberry in our market was the wild Strawberry of the field, and that limited to a short season. Now we have in variety these delicious fruits, by the facilities of transportation, for two or three months, receiving from the South in a single day 5000 bushels, and from the single city of Norfolk, in Virginia, 16,000 bushels, and from our own town of Dighton 10,000 bushels in a year. . . . Then the cultivation of the Pear was limited to a few varieties, since which the gardens of MANNING, HOVEY, the writer, and others have embraced more than 800 varieties of this noble fruit. Then no exports of fruit of any note had been made. Now Boston alone has shipped over 600,000 barrels of Apples in a year, and the export of fruit from this country has amounted to nearly 3,000,000 of dollars in a year." In his review of this wonderful progress the author has enumerated various causes that have led to it, but he has forgotten to say that one of the most potent among them has been the example, the energy and genial influence of MARSHALL P. WILDER.

— OUTLINES OF THE COMPARATIVE MORPHOLOGY OF ORCHIDS.—Prof. FITZGER asks us to say that the object of his work, recently reviewed in our columns, was not "How to distinguish Orchids out of flower." As we are responsible for the use of this latter heading, as well as for the insertion of a woodcut which does not bear the interpretation we put upon it, we willingly recognise the Professor's objection, at the same time the interest which our readers would feel in the subject would almost wholly centre in the practical use they could make of it.

Questions of comparative morphology are hardly suitable for discussion in these columns, unless they have a practical bearing. At the same time we must express our regret that there should be a tendency among German botanists to divorce morphology from systematic classification. We should rather say that, from a scientific point of view, each is comparatively useless without the other.

— BONGARDIA RAUWOLFII.—About half a dozen years ago, when this singular little herbaceous barberry was figured in the *Botanical Magazine*, it was stated in the letterpress accompanying tab. 6244 that the species has on several occasions been introduced into cultivation in England, but never kept long. The plant from which the figure quoted was made is now in fine flower at Kew, and does not show any signs of falling away; indeed it is finer and stronger now than it was when it first flowered. It grows in the open border, and is sheltered from excessive rain and moisture by a handlight, under which it flourishes. The cold of winter does not seem to affect the small Potato-like tubers. The pretty foliage is all radical, glaucous green, with the exception of a portion of the pinnules nearest the rachis, which is reddish-purple. The large drooping flowers, with notched golden-yellow petals, are freely borne in branched panicles. *B. Rauwolfii* was described by RAUWOLF in 1573 as the true *Chrysozomum* of DIOSCORIDES, in a chapter of his travels devoted to "A short and plain narration of plants which I gathered during my stay at Halepo, in and around about it, not without great trouble and danger, which I glued upon paper very carefully" (RAY).

— TESTIMONIAL TO MR. CRUMP, LATE OF BLENHHEIM.—To express their esteem for and their regret at his leaving, the workmen employed in the above gardens have presented Mr. CRUMP with a silver-plated tea-service, accompanied with their best wishes for his success in the market garden business he has entered on at Leamington.

— THE LATE MR. FRANCIS.—To one to whom the newspaper press of this country is under the deepest obligations for the strenuous and successful efforts he made to free it from vexatious and costly restrictions which hampered the diffusion of knowledge, we desire to add our tribute of respect. Mr. FRANCIS had been for so long a period publisher of the leading literary journal, the *Athenaeum*, that we believe he could boast of having been connected with the press longer than any other contemporary, and so connected as to have ensured the respect of all with whom he came in contact.

— RHODODENDRONS AS CONSERVATORY PLANTS.—The excellent group of these in pots staged by MESSRS. H. LANE & SON, of Beikhamstead, in the conservatory at the Royal Horticultural Gardens on Tuesday last, illustrated in a remarkable degree the great decorative value of Rhododendrons for spacious conservatories. Plants of fair size—certainly not too large for the purpose—were seen laden with enormous trusses of really splendid flowers. The selection of varieties, confined to some thirty or so plants, was an excellent representative one. The greatest brilliancy of colour found in the Rhododendron was illustrated in Michael Waterer, John Waterer, Nelson, bright magenta-rose, very fine; James Bateman, very fine and showy; Admiration, Marchioness of Downshire, Crown Prince, and Baroness Rothschild, edged with vivid rose, very fine—these may all be grouped under the head of scarlet and crimson shades. Sir Joseph Whitworth is probably the darkest Rhododendron we have; it is almost black, and forms an excellent contrast to the brighter coloured sorts. Sir Isaac Newton, pale purple; and Sir Thomas Sebright, dark purple, are very attractive because of decided tones of colour. Into the magenta and rose coloured group come some extremely pleasing varieties, such as Aganennon, delicate lilac-rose, very fine; Concessum, warm pale pinkish-rose, very fine; Kate Waterer, very bright rosy-magenta, fine form; and strikingly bold truss; James Mason, edged with rich magenta-rose, very fine; Roseum pictum, in the way of James Mason, but paler on the edge, very fine; Auguste Van Geert, deep purplish-magenta flowers of fine form and splendid truss; and Mrs. Mendel, very free and fine. Fastuosum fl.-pl. is of a distinct lilac shade, and has large and showy semi-double flowers; Vauban, pale rosy-

lilac, very distinct; Everestianum is of a pale peach hue, very pretty indeed. Of the white varieties there are The Queen, Mrs. J. Clutton, and Purity, the last-named the nearest approach to a white, but lacking the fine form of the two former. It was a group to be proud of, and the plants attracted the admiring attention to which they are so justly entitled.

— HYBRID RHODODENDRONS.—Messrs. VEITCH'S fine collection of seedlings of the javanicum section is specially worth visiting just now. Almost every day some new seedling opens its flowers, showing great variations in colour and substance of flower. The inferior ones are discarded, the better ones grown on, and it may be rehybridised, so that we may look for larger flowers and even brighter colours. If allowed to grow on continuously without a check in a temperature of about 60°-65° they will flower repeatedly, but if growth is suffered to be arrested they will bloom only once in the season.

— PUBLICATIONS RECEIVED.—*The Rose*. By H. B. ELLWANGER, Mount Hope Nurseries, Rochester, N.Y. (DODD, MEAD & CO., New York).—*A Manual of Indian Timbers*. By J. S. GAMBLE, M.A., F.L.S., Officiating Conservator of Forests, Bengal. (Calcutta: Government Printing Office).—*The Kufiberry and Strawberry*. By D. T. FISH. (*The Bazaar* office).

— OBTAINING PLANTS BY FRAUD.—On Thursday, the 6th inst., at the Quarter Sessions held at Maidstone, HENRY PIDGEN, alias SAMUEL BEND, was sentenced to six calendar months' hard labour for having obtained from Messrs. J. LAING & CO., nurserymen, Forest Hill, on November last, shrubs, Rose trees, and bulbs, by falsely representing that he was employed as gardener to one of their customers. The prisoner was arrested on March 4, at Chelmsford Gaol, at the expiration of two months' imprisonment, to which he had been sentenced for having defrauded Mr. FRASER, nurseryman, of Lea Bridge, in a similar manner.

— THE WEATHER.—General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending April 10, issued by the Meteorological Office, London:—The weather has been dry and very fine and bright in all parts of the kingdom. Lightning was observed at some south-eastern stations on the 5th. The temperature has been a little below the mean in the north-eastern parts of the country, and about equal to the average, or slightly above it, elsewhere. The thermometer was highest either on the 6th or 8th, when it rose to 65° at Lauderdale (Loch Sunart), 64° at Southampton and Stratfield-Turgiss, 63° at Barrow-in-Furness, Collyumpton, and in London, and to between 55° and 62° elsewhere. The minima were generally registered towards the end of the period, and were rather low, ranging from 26° in "Scotland, E.," to 31° in "England, E.," "England, S.W.," and "Ireland, S." Rainfall has been much less than the mean in all districts. Bright sunshine shows a very decided increase, the percentages ranging from 39 in "Scotland, E." to as much as 66 in "England, S.W.," and 69 in "England, E." Depressions observed:—During the whole of this period a large area of high pressure has existed over Scandinavia and on the northern coasts, while the barometer has been lowest over France. The only depression observed travelled in an easterly direction across France on the 4th and 5th. The wind has consequently been easterly over England and Ireland, and easterly to south-easterly in Scotland. In force it was generally moderate to fresh, but at the close of the period it was exceedingly light, and in many places calm.

— GARDENING APPOINTMENTS.—Mr. G. MAYNARD, for the last six years Plant Foreman to Mr. BESLEY at The Denbies, Dorking, has been engaged to succeed Mr. HENDERSON as Gardener to Sir G. BEAUMONT, at Cole-Orton Hall, Leicestershire.—Mr. WILLIAM UTTERSON, late Gardener to JOHN FURVES, Esq., of Kinaldy, St. Andrews, has been engaged (through MESSRS. DOWNIE & LAIRD, Edinburgh), as Gardener to Mrs. HUGH NIVEN, of Dalnottar, Old Kilpatrick, by Glasgow.—Mr. JOHN CLARK, late Gardener to Sir G. A. C. EAST, Bart., Half Place, Maidenhead, has succeeded Mr. E. CRUMP as Gardener to H. HARRIS, Esq., Stevenston Manor, Micheldever, Hants.

ALPINE PLANTS.

DAPHNE.—The genus *Daphne* comprises a certain number of species which constitute one of the finest ornaments of our gardens. Almost all possess a delicious perfume and an attractive flower. They are sometimes thought to be difficult to cultivate, and especially difficult to propagate, on which account I hope I may be doing service by giving the results of my experience.

Daphne alpina, L., is met with here and there in the Alps, but never in very large quantities. It is a shrub attaining the height of 25–35 centimetres (about a foot) producing from April to June a succession of small greenish-white flowers. It requires a rocky, light, and dry soil. It is generally found growing in the fissures of the rocks, and its roots extend to such a depth that it is often necessary to dislodge the rock itself to obtain the plant. Nevertheless, if it is to be transported to the plains it is necessary, as far as possible, to dig up the whole of the root, and not to select old specimens, but to take those which are small and young. It is generally supposed that *D. alpina* may be cultivated like *D. Mezereum*, by reason of the similarity of their habits, but this is not the case, for while the *Mezereum* requires a moist soil, rich in humus and succeeds well in moist localities, *D. alpina* prefers the dry rock. When I receive plants of *D. alpina* from the mountains I always grow them in pots for a year before placing them out on the rockwork. *D. alpina* succeeds well from seed, and may also be grafted on the *Mezereum* and on *D. laureola*.

D. altaica, Pail., has much resemblance to the preceding species, but its flowers are larger, whiter, and more beautiful. It is an Asiatic species, but succeeds well in our climate and does well on the rockwork. *D. altaica* is of shrubby habit, attaining a height of from 35–60 centimetres (1–2 feet). It flowers in June, and may be cultivated in peat earth mixed with a little vegetable mould, multiplied by seed or by grafting on *Mezereum*.

D. Blagayana, Frey.—This plant, the most beautiful and interesting of our *Daphnes*, was discovered in Carniola in 1837. It is still rare in cultivation. The plant in question is rather difficult to cultivate until its habits are well understood. *D. Blagayana* grows in the clefts of the rocks in dry spots exposed to the southern sun. To cultivate it successfully, therefore, it must be grown at the top of the rockwork in a warm aspect and in a light soil. If it has to be grown in a damp, marshy locality, it must be grown on a slope, as is done in the case of *Saxifraga longifolia* and *Ranunculus pyrenicus*. A peculiarity of this *Daphne* is, that although its stems like an exposure to the full sun, its roots must be kept cool and moist, but not wet. This is the case with many plants which thrust their roots deeply into the clefts of the rocks. Professor Plantamour, of Geneva, had a plant of this species which did not flower, and seemed likely to die. He therefore covered the stock of the plant with moss overlaid with stones, so that the sun no longer scorched the uppermost roots, which in this species have always a tendency to appear above-ground. After this the *Daphne* flowered abundantly every year. The plant is of scrambling habit, but forms little bushes of 25–30 centimetres in height (about a foot). These bushes are covered in April and May with yellowish-white flowers, which have a delicious perfume. It may be grafted on *D. Mezereum* or *D. laureola*, or may be multiplied by layering the numerous branches which trail on the soil. The plant is rarely raised from seed. For soil I advise a mixture of loam, heath-mould, and peat (see fig. 80, p. 505).

D. Cneorum, L., is remarkable for the beauty of its flower and its delicious fragrance. It is scarcely an alpine plant properly speaking, and its cultivation is different from that of true alpine plants, since it is a plant of Southern mountains. Its habit is dwarf, its stems are slender, trailing over the soil and covering the rocks and stones amid which it grows. The stems are completely covered with flowers in May and June, forming large tufts of the finest rose, shaded with a deeper tint of the same colour. The bud is deep rose colour, but the expanded flower is paler. In our rockworks it produces a fine effect, but it may also be grown as edgings, or in clumps, or in the place of turf. The flowers last for about two months. It is difficult to transplant, owing to its large, deeply-penetrating roots. The young plants should be chosen with a large ball of earth. Propagation by

cuttings, but especially grafting on the *Mezereum*, are the best means of multiplying this species. There are two varieties in gardens, one with variegated leaves, and the other with large flowers.

D. Verolii, or *D. Cneorum* *Verolii*, is distinguished from the species by the bark of the old wood, which becomes of a deep brown colour, by its longer leaves, by the colour of the flower (bright rose on both surfaces), and by flowering a fortnight later. This variety is met with in the South of France. The cultivation of it is the same as that of *D. Cneorum*.

D. collina, a native of the Italian mountains, has a shrubby habit, with fine shining evergreen leaves. Its flowers are produced in spring, and are of a deep lilac colour, exhaling a delicious odour. It may be considered as one of the most desirable of rock plants. It requires heath-mould mixed with loam and humus. It may be grafted on *D. laureola*, or propagated by cuttings, like *Cneorum*. There are two varieties—one variety, minor, very pretty and free-flowering; the other with variegated leaves, not often met with in gardens.

D. Ghidoui, L., called in French *garou*, grows wild on the dry rocks of the South of Europe, and forms rounded bushes covered with very closely packed small leaves. The flowers are produced in June in great abundance, and are small, white or reddish. It requires the same cultivation as *D. Cneorum*.

D. laureola, L., is indigenous throughout great part of Europe. I can only express my regret to see it so neglected as a decorative plant, and treated only as a stock for grafting upon. Our forefathers understood its decorative value better than we do, for we find it in most of our old parks, where it was formerly much cultivated.

D. Mezereum, L., is the most widely cultivated species. Its habit of flowering in early spring, before the leaves expand, renders it very desirable. It prefers a soil rich in humus, and succeeds well when highly manured. There are three varieties of it, one with white flowers, the other with variegated leaves, and a third which flowers in autumn. Multiplication by seed is very easy. The seeds should be sown in pots in the shade immediately they are ripe.

D. Masali, a native of Japan, is a plant I do not know, but which is said to be very hardy, and suitable for growing on rockworks and forming edgings. It is very free-flowering and sweet-scented, and is propagated by cuttings or grafts.

D. obovata, L., a native of the Caucasus, has evergreen leaves like those of the Olive, with beautiful white fragrant flowers. It requires a sheltered position in Switzerland, but is, I presume, hardy in England.

D. pantonii, L., is also an Asiatic, and very hardy species (which thrives in London gardens). Its shining foliage is evergreen and very attractive. It bears greenish-yellow sweet-scented flowers in February and March. The two latter species are grown like *D. collina*.

D. salifolia, Lam., is a pretty little shrub with a profusion of white flowers which are produced in April and May. It requires a moist soil, rich in leaf-mould, with which peat soil should be mixed. It may be grown from seeds, or may be grafted, but I have never seen it propagated by cuttings.

D. striata, a Tyrolean species, is one of the prettiest ornaments of the rock garden. It may be cultivated like *D. Cneorum*, to which it has some resemblance, but is more elegant.

The *Daphnes* in general require a rich, light soil, neither too dry nor too moist. If grown in pots they must be grown in a shady and rather dry place. They like a drainage of calcareous pebbles or small pieces of coke, which may be used in the open air as well as in pots. *Henry Corroon, Inspector, Botanic Garden, Geneva.*

BEGONIA LUCIDA.—One of the prettiest groups of plants that can possibly be imagined we saw lately managed with a row of this lovely *Begonia* in the garden of E. F. Studl, Esq., Oxton Hall, Devonshire. The plants are grown for special decorative purposes in small pots, and the usual brightness of the leaf which characterises this variety is, in the case of the plants referred to, intensified, so much so that one would be inclined to suppose that the leaves had been oiled over. But upon closer inspection it is seen that the intense brightness is due only to liberal cultivation. Such stubby little plants, with leaves covering the rim of the pot and bearing several trusses of flowers each, are objects which may be used with good effect alike in the sitting-room, show-house, or conservatory, or, as in the present case, for bordering groups of plants, for which they are eminently adapted.

HOME CORRESPONDENCE.

The Double Crimson Primrose.—This fine old plant can never become a common border flower, as there are two requisites to its cultivation which cannot be attained in the open border. It requires a situation where it can "never see the sun, or feel the frost," as one of the most successful cultivators in Ireland once told me. It is perhaps as well managed in the nurseries of James Dickson & Sons, of Chester, as in any place in England. I saw the other day a very fine lot of strong healthy plants, as well as the old purple (which I think is worse to keep than the crimson), the rose or pink, and the yellow. I was informed that the plants were not so strong this spring as usual, but from what I saw there was nothing to complain of, as single crowns of last year were making three and four crowns each. The best situation is a cold frame with a north aspect, shaded by a wall or hedge; good yellow loam and leaf-mould, three parts of the first to one of the latter, and no manure of any description. Once or twice a year it is advisable to give a top-dressing of the same soil, pressing it firmly round the collar of the plant. They should never be allowed to become dry, and a daily syringing morning and evening in dry, hot weather prevents red-spots, and cures those feelings of very prone. Among more recent additions to this family *P. platyptala* is a great acquisition; it is much harder than the older double forms, more floriferous, and succeeds well either in the open border or on rockwork; in fact, it should be in every collection. *Alpha.*

Tulipa sylvestris.—Possibly some of your readers who take an interest in wild flowers will be glad to learn that this very rare British Tulip is still to be found growing wild in some parts of England. Not far from where I am now writing there is a fine patch of it, a few square yards in fact, and containing probably a thousand bulbs. "Ah, I wish I was there with my trowel," says the commercial botanist and plant exterminator. "Yes, no doubt you do; but there is not the remotest chance for you to commit your depredations, and it will pay you better to stay at home," is the rejoinder. Its bright yellow flowers nodding and glistering in the sun are such to cause a thrill of joy to run through the frame of the enthusiast, and to excite those feelings of very desirable pleasure which one experiences on finding something concerning which his only previous acquaintance has been derived from books, or from statements and descriptions volunteered to him by friends and eye-witnesses. Out of this large number of bulbs there are only three now in flower; this is doubtless owing to their growing so thickly together, forming as they do, in conjunction with weeds and other things, one complete entangled mass of vegetation. *Species* of rare British plants, do any of your readers happen to be in a position to state positively if *Saxifraga repens* (syn. *Linnaea borealis*) is still to be found growing wild or naturalised in any part of Great Britain? *J. Horsfield, The Gardens, Heytebury, Wilt.*

Dielstra or Dicentra?—It is to be hoped that the *Dielstra* will be allowed to retain that generally known name, *Διέστρα* is as good a word as *Saxifraga*, and quite as suitable. *Philomet.* [Botanical names are regulated by botanical priority without reference to classical usage or even propriety. *Dicentra* being the oldest, and the adopted botanical name, should be generally used; but if our correspondent prefer to use *Dielstra*, he will be readily understood, and will not suffer anathema. Ed.]

New Potatoes.—On looking over "A. D.'s" list of above, p. 400, March 25, I find that the following at least were sent out in 1881, namely, *Inglishen*, *Fluke*, *Cromwell*, *Queen of the Valley*, and *Adirondack*, having myself taken them from leading Potato lists in 1881, and had a supply; these varieties, therefore, cannot rightly be said to be "offered in commerce for the first time this season." Potato growers should therefore note this. *W. K.*

The Potato.—Recently, in looking over a history of Shropshire, written apparently in one of the early years of the last century, I met with the following description of the cultivation of the Potato in that county—it may interest some of your readers:—"The soil of this county is found to be excellent for Potatoes, a restorative Delicacy, not much inferior to Artichokes, and propagated with little or no pains in tillage. A few acres of them (so apt are they to increase) will go far in furnishing a city with food, and the country round. They are sold at Bristol market at 4s. per bushel. Children of poor people

will eat them raw, instead of bread or other food, without any detriment to them; but others dress them various ways, as boiling, roasting them in the embers, cutting them in small pieces, and baking them with fat meat in pies; some strengthens their beer with them. They are all these ways strong and wholesome nourishment, and are therefore the more to be cultivated, because they may supply the want of corn in times of famine, as they did for two years together in Ireland, when their corn failed." *Philomelos*.

Rhododendron Nutalli.—In your No. 431 this most beautiful plant is again accused of being a shy flowerer. Since I flowered it for the first time in April, 1858, it continued to flower every year with me until it perished by an accident fifteen years later. The last time it flowered with forty-two trusses. It stood in a rocky corner of a winter garden, and so glorious and truly grand was the sight that I have seen ladies quite overcome when coming upon it unexpectedly. It is, indeed, a pity that this king of the Rhododendrons is so rarely seen in good condition. In the article mentioned it is said that the secret of blooming the plant is to keep it pot-bound. I have done quite the contrary. I had it planted in the best peat mixed with Oak mould, sand, and a little good loam; later on it was planted out in my winter garden and kept rather moist and warm in spring. I possess now four medium-sized plants of this species. Two of them will soon open their flower-buds. That

latum, II. auriculatum, II. scabrum, II. pulcherrimum, II. crispatum, II. polyanthos, Trichomanes Luscitanianum, T. exsectum, T. reniforme, T. venosum, and T. Petersii, many of them from 1 foot to 18 inches across, and grand masses of most of the forms of T. radicans. All are in the most perfect condition, and are a sight worth seeing. They are carefully shaded from the sun, and of course kept moist at all times. I am sure many who are puzzled to get anything to grow in shady window cases could soon form a permanent and beautiful arrangement with these lovely filmy Ferns. Mr. Foster agrees with me that these things are never safe in heat. *James O'Brien*.

Hyacinths and Tulips.—At Cintra Lodge, Whitley, Reading, the residence of Martin Hope Sutton, Esq., there is at the present time as fine an example of bulb gardening as any one could wish to see. The fine weather of the present season has, of course, assisted largely the perfect development of the flowers—and they are really perfect—the Hyacinths particularly so, all kinds being quite as fine as those grown for exhibition purposes. For the most part they are planted in separate colours in large masses—small circular beds containing about a hundred bulbs—larger circular beds being also planted in masses, the bed being divided into three equal parts—black form—red, white, and blue being the three colours used in those filled with Hyacinths. Single kinds only are used, and the best are *Mimosa*, dark purplish-

of labour. Thus much as to the open-air department of this at all times beautiful and well-kept garden, and at the present time especially so; but it is only right to add that the houses, equally with the outside, testify to Mr. Sutton's love of his garden, and to the skill and energy of his gardener. *H.*

Bulbs in Spain.—I know of few things more surprising than the extraordinary abundance of bulbous plants in the meadows in some parts of Spain. I shall never forget a large sort of meadow or common just outside of the city of Leon, in which Mr. Maw and I took a walk one evening after dinner. It was covered with countless thousands of *Colchicum*, *Muscari*, *Bellevalia*, *Narcissus*, &c. There were almost as many leaves of various bulbous plants as blades of grass. When that meadow is in full bloom it must be a glorious sight. The meadows in another direction outside the walls of the same city were profusely enamelled with a small golden-yellow *Corbularia*, which I should call *C. bulbocodium* minor. Near the city of Oviedo the large and lovely *Corbularia citrina* thickly studs the grass. Between the Escorial and the station of Naval Peral, the line runs through carpets of the beautiful little *Corbularia Graellsii*. In the vicinity of Naval Peral and Naval Grande, the wet mountain meadows are clothed with gold by the blooms of the tiny little *Corbularia nivalis*. I think, however, the sight which astonished me most was a small damp meadow just outside the seaport town of Gijon, in the province of the Asturias. It was literally choked with a *Colchicum*, several species of *Narcissus*, *Scilla umbellata*, *Serapias lingua*, and various species of *Orchis*. The farmer, apparently in despair of getting a crop of grass, had dug up the bulbs wholesale where they were thickest, and they laid strewn about the meadow. I collected a number of them. Two species were then in bloom, *Colchicum bulbocodium* (the typical species), and *Narcissus biflorus*. I have since my return bloomed two other species, e.g., *Narcissus chrysanthus* and *Corbularia citrina*. *H. Harper-Creech, Drayton-Beauchamp Rectory, April 5.*

Proliferous Pines, &c.—In a recent number of the *Gardeners' Chronicle* there is an excellent figure of a prolific Pine-apple. Permit me to mention a fact which occurred in the Pine-pits of M. Vallerand, of Bougival. All the Pine-apples there cultivated, of whatever variety, became prolific; the suckers of the year, the young plants of two years old, and the fruiting plants, all without exception fruited, it will be readily believed to the despair of the gardener. Not a single plant escaped this phenomenon. The Pine-pits contained plants bearing fruit of different sizes but all presenting at the same time this curious anomaly. Another thing inexplicable to me is the simultaneous appearance of the same anomalous form, sport, in different individual plants of the same species, and which are not placed under the same conditions. We grow here at Argenteuil two varieties of Figs very different in general appearance and habit, the violet Fig and the white Fig; an intermediate variety, with a red skin and white flesh, was produced two years ago on a plant with violet fruit, and the same thing happened in another garden also. The branches of these layered have produced plants which will, I hope, preserve this character. We have reason to hope that this may be so since one of my neighbours possesses a Fig nearly a hundred years old presenting this character, and which is the result of a like anomaly. These Figs have been called after the names of the cultivators in whose gardens they made their appearance—Joret, Defresne, Cottard, &c. I avail myself of the opportunity to inform you that the seeds of the Soudan Vine, originally introduced by the late Lecart, and of which I have received a fresh importation, have come up well. The seeds which I received from Soudan six weeks ago have germinated well, and will afford us an opportunity of testing the assertions made by Lecart as to the probable value of these plants in European vineyards. *Godfrey, Argenteuil, France.*

Camellias.—For general decorative purposes few plants are more valuable than Camellias, as they are not only exceedingly showy, but they come in at a time when flowers are scarce. The season when they are the most prized and pay best to grow is during midwinter, and to have them then many attempt to force the plants by subjecting them to heat just before, which is a great mistake, as any extension of heat caused by artificial warmth causes a shedding of the buds, and if by chance any should remain on, the blooms from them are sure to be small and poor, and the petals flimsy and thin. If Camellias are to flower early the forcing must be done now, as by getting plants to make their growth betimes they bloom naturally about six or seven months after without further help. Although of a cool damp atmosphere later on, and later in the year, Camellias delight in heat now, and will stand and enjoy almost a stove temperature, which, if accompanied with plenty of moisture, helps them on

FIG. 50.—DAPHNE BLAYAYANA. (SEE P. 504.)

a species attaining a size like Nutalli will not flower in an adult state is comprehensible, but I am quite sure that under the treatment mentioned above better results will be obtained than by starving the flowers. *O. F. Lehnhof, Lower Austria.*

Clandestina rectiflora, Lam. (*Lathraea clandestina, L.*).—This has been very well grown for a long time in the Berlin Botanic Garden, where I saw a large mass of it. My representation in *Keichenbach's Icones*, xx., tab. 16, is taken from fresh specimens, kindly sent from that place by the late Alexander Braun. *H. G. Rehb, f.* [The specimens from Biarritz had much longer corollas than those figured by our correspondent. *Ed.*]

Filmy Ferns without Heat.—The most direct proof as to the perfection to which these plants can be brought without artificial heat exists at the residence of Mr. Cooper Foster, 29, Upper Grosvenor Street. That gentleman has succeeded in growing a splendid collection of them in a small unheated structure built at the back of his house. The specimens (which are planted out) are marvels of beauty, and comprise most of those generally supposed to require a high temperature as well as the hardier kinds. I am sure that many will be glad to profit by the experience which Mr. Foster's experiments have secured, and to try their *Trichomanes*, *Todeas*, and *Hymenophyllums* (which are in many cases languishing in warm houses), in cold shady places where they may thrive without much trouble being taken with them. Among the collection are fine specimens of *Hymenophyllum caudicu-*

blue, extra fine; *Coronone de Celle*, light blue, immense bells; *Amy*, very bright red; *alta superbissima*, snow-white, and very large; and *Gigantea*, bluish-white. Tulips are planted in exactly the same way as are the Hyacinths, and as regards gaiety far overtop the Hyacinths. The following are all superb varieties, many beds being filled with them, and as there is not a blank spot in the lot the effect is dazzling in the extreme:—*Belle Alliance*, brilliant scarlet; *Keizer Kroon*, scarlet and yellow; *Vesuvius*, very large flower, bright crimson; *Proserpine*, rose colour, extra fine; *Chrysolora*, bright yellow; *Pottebakker*, bright yellow; *Joost van Vondel*, rose and white, very good; *Vermilion Brilliant*, a fine bright purple; and *Maxima*, scarlet edged with yellow. All the blocks of colour and the smaller beds, consisting of one colour only, are newly imported bulbs, but there are several other extremely effective beds that are planted in mixture with the old bulbs of last and previous years, and all who have the good fortune to see these beautiful beds will for certain, in future, preserve their old bulbs, as they are but a shade smaller, either in size of flower or spike than the new importations. In answer to my inquiry as to how he managed to ripen the bulbs and yet get the summer display that there always is at Cintra Lodge, Mr. Cook (Mr. Sutton's gardener) said that as soon as he wishes to prepare the beds for the summer bedding, if the bulbs are not sufficiently ripened, he heels them in in the kitchen garden till the tops die off, the bulbs are then lifted, dried, and stored away in a cool place, and truly the results obtained will warrant so small an expenditure

wonderfully, and will often bring sickly specimens round. Before placing any in heat they should be overhauled to see if they require pruning or re-potting, and in the case of any that are unhealthy it will be necessary to considerably reduce the ball and give them fresh soil. The reduction of the ball is best effected by picking it away from among the roots by the aid of a sharp-pointed stick or piece of iron, and it may be desirable to wash out some of the earth, and after this is done each plant should be stood by for a few hours to drain, when they will be ready for potting. Camellias grow freely in either peat or loam, or a mixture of the two in about equal parts, which is preferred by many cultivators; but where good fresh yellow fibry loam can be obtained nothing answers better, as they root freely in it, and make stout, short-jointed, good flowering wood. If loam is used it should be chopped up somewhat roughly, have a little soot sprinkled over it, and then be turned over to mix. As Camellias require liberal supplies of water during certain seasons it is a very important matter to see that the pots be well drained, and as the plants stand a long time in them it is advisable to use a mixture of broken bones, corks, and charcoal for drainage, among which the roots find their way and extract the food which the bones and charcoal absorb from what passes through the soil. The drainage effected by such a thing in a pot is to work the fresh loam into the cavities of the ball, that they may all be filled firmly, and the whole made solid again, otherwise, when water is given, it will find its way through without soaking the soil. Not only is the present a good time for overhauling and seeing to old unhealthy plants, but it is the best season for repotting young ones, as they bear the disturbance now better than they do later on, after the buds are formed, when any check or interference with the roots is apt to cause them droop, and give a larger shift will, for a time, require careful watering, and especially any that are shaken out, or have the ball much reduced; and to encourage these to form fresh feeders, it will be necessary to syringe freely overhead both morning and evening, which, with shade, and a good brick heat engendered by shutting up early, will soon start them into strong and active growth. With a suitable house, not over light, Camellias do best kept under glass during the summer, but where conditions are such that they have a good exposure to sufficient shade, and moisture afforded, they should be stood out under the north side of a wall or building, or where they can have the shelter and protection of tall trees or shrubs. Of the two positions I like the last-named the best, as there they enjoy more atmospheric moisture than they do near walls, which absorb it and so rob the plants. When these are placed out, it is very important that they be stood on slates or tiles to prevent the injury of worms, for should these enter the pots they get natural shade in such a manner that water when given finds a too quick passage through, and does not soak the whole of the soil. Where convenience exists for planting Camellias out, that is by far the most preferable way of growing them, as with their root-run unrestricted they make great progress and flower with wonderful freedom. In vinerias and other houses there are often bare back walls that cannot be utilised for anything else, which is just the place for Camellias, these being far from the glass they get natural shade and flourish accordingly. By planting the different varieties, a very long succession of bloom may be obtained, as the plants make their growth in rotation, and if the first vines are forced so as to have ripe grapes in June, plenty of Camellias may be cut at or before Christmas, and the plants are ready to start on again with the vines. Ours have made their young wood already, and we always have an abundant supply of flowers from October onwards, without robbing the plants in the pots. The only insects we find that interfere with them are scale, which soon disappear after a syringing with a solution of nicotine soap or paraffin and water in the proportions usually applied—a mode of cleaning them which saves much time and labour, and is far better than sponging by hand. Camellias are so hardy, that they will live and grow out almost anywhere, and do really well in sheltered favoured spots such as snug corners under walls, where if planted out in suitable soil, such as fresh cut loam, they thrive amazingly, and soon become objects of great beauty. *J. Sheppard.*

Nicotiana affinis.—Seeing a note in your last impression respecting the above plant, I wish to state that I have tried several plans to keep the flowers expanded when cut. By cutting them at night, and placing them in water at once, they will keep fully expanded night and day. I have some now cut ten days, and they are apparently almost as fresh as when first cut. *H. Marshall, Bournemouth.*

Lonicera sempervirens.—This is undoubtedly one of the best greenhouse or conservatory climbers in cultivation. There is now a plant in the cold house at the Newton Nursery, Chester, worth going some

distance to see. It has been in flower since Christmas, and has at this time forty-five fully expanded clusters of flowers, and many more to come. In fact, it is seldom out of flower. One great recommendation is that it is a very clean plant, having few or no insect pests. In some few places it succeeds in the open air, but never so well as under glass. It also makes a good pot plant; but requires some little time to get the main stem strong enough to support the plant without stakes. *Lonicera sempervirens flava* and *Brownii* are very good companion plants to the above. *S.*

Valerian Phu-aura.—This hardy golden leaved plant is a great acquisition, and most valuable for spring gardening. In the gardens at Hanfield Grove, near Uxbridge, the seat of George Webster, Esq., I recently noticed some plants of this Golden Valerian, and Mr. Gough, the head gardener here, thinks very highly of it. It is certainly a very telling plant in a spring flower garden or for general decoration. *D.* [The plant has been cultivated for years in botanic gardens: it is strange that its merits should only now be recognised. Ed.]

Reports of Societies.

Royal Horticultural.—April 11.—James MacLay, Esq., in the chair. The Rev. G. Henslow described the *Rhododendrons* and other plants shown at the meeting of the Scientific Committee, and which are fully alluded to below. As was to be expected, coming so close upon the great popular holiday, the show in the conservatory was not so extensive as the last, but nevertheless included some special features of interest. Messrs. Barr & Sugden received a Silver Banksian Medal for an extensive display of Narcissi, consisting of cut blooms of about 160 species and varieties; and Messrs. H. Lane & Son received two awards of a like value in groups of half specimen pot Roses and forced *Rhododendrons*, which are alluded to elsewhere. Mr. B. S. Williams again contributed a fine of Ananrills, Orchids and other flowering and fine-foliaged plants and also received a Silver Banksian Medal. So too did Capt. Patton, Alpha House, Regent's Park, for a collection of cut Tulips and Narcissi. From the Cranston Nursery and Seed Company, Hereford, came five boxes of superb cut blooms of Tea Roses, which gained a Bronze Banksian Medal. The Marchal Niels and Safranros were much admired, but not more so than a white, pink tinted flower named Nina, a most lovely bloom in the bud, and Red Safrano, a coppery-red coloured form of its namesake. The same firm had also some cut blooms of their *Hoya globulosa*.

SCIENTIFIC COMMITTEE.—Dr. Maxwell T. Masters, F.R.S., in the chair. The subjects brought before the meeting on this occasion were relatively few, but their paucity was compensated for by the noble specimen of the Waratah sent from Sir George MacLay's garden, and the brilliant *Rhododendrons* from Mr. Mangles and Mr. Bosceawen.

Rhododendrons.—Mr. Mangles brought specimens of various *Rhododendrons*, as follows—

R. niveum.—A species so named from the colour of its flowers, the substance of which in the young state is snowy-white, but which assumes a brownish tint; subsequently the flowers are arranged in very compact trusses, and are of medium size, nearly regular, tubular, pale lilac, with spots at the base of the corolla, as in *R. arboreum*. The stamens and style are of about equal length, and are not deflexed. Mr. Mangles finds it difficult to cross. The species is somewhat tender, though Mr. Bosceawen sent trusses of it from Lamorna, Cornwall, where on the day before it was despatched a frost of 8° was experienced.

R. arboreum.—Specimens of the true form with very deep somewhat dull red flowers were shown, the leaves being silvery on the under-surface.

R. Thomsoni, with flowers of a deep blood-red colour, each protruding from an unusually deep cup-like pinkish calyx. The leaves of this species are relatively small, obtuse, and glaucous on the under-surface. With this was shown a hybrid between *R. Thomsoni* and *R. Fortunei*; the truss bears a larger number of flowers than exist in either parent; the colour of the leaf is not so glaucous as in *R. Thomsoni*, and the flowers are of a pale rose.

R. Otto Forsteri.—A magnificent hybrid, raised between *R. Edgeworthii* as the pollen parent, and *R. Veitchianum*, a Moulmein species, as the seed-parent. The leaves of this are lanceolate, glabrous, with short, shaggy petioles; the flowers 5 inches

across, pure white, with a pale yellow base internally, broadly bell-shaped, with oblong somewhat wavy segments; altogether a grand variety.

Another hybrid shown was one raised between the pollen of *R. campylocarpum*, a yellow-flowered species, and the ovules of a crimson-flowered hybrid variety. The result was a form with a loose truss of relatively small bell-shaped flowers almost pure white.

R. virgatum.—A dwarf species with small ovate-anceolate leaves, and small bell-shaped lilac flowers proceeding not from the axil of a scale, but of a true leaf.

R. atalavense ×.—A truss of the original rose-coloured variety, originally obtained at High Clero from the union of *R. arboreum* with a hybrid (obtained from catawbiense and ponticum), and the parent of most of the hardy hybrid rose-coloured *Rhododendrons*.

Various other hybrids were shown, as between *R. argenteum*, male, and *R. ponticum*, female, in which the ponticum character prevailed, and in which the anthers were sterile; between *R. ciliatum* and *R. glaucum*, in which the flowers were of pale rose-lilac hue. *Azalea linearifolia*, a curious Japanese species, in which not only are the leaves linear, but the pinkish corolla lobes are linear also, and free nearly to the base.

A variety sent from Mr. Bosceawen, called Lady Mary Bosceawen, had pale rose or bluish flowers of much beauty, but which had been hurt by frost, and the variety, it was considered, was surpassed by other newer productions.

Fanunculus Helderichii.—Mr. G. F. Wilson showed under this name flowers of this distinct looking *Buttercup* with the habit of our *R. acris*, but with silky pubescence and large bright shining ananry-yellow flowers and reflexed calyx. It does not agree with the character of *R. Helderichii* as given in Boissier's *Flora Orientalis*.

Double Lafagera.—Dr. Masters reported on a double flower of this plant referred to him for report at the last meeting. It did not differ materially from other double flowers of the same species, the outer segments were more or less leafy, the two anther-lobes of several of the stamens were replaced by flat petal-like expansions, so arranged as to resemble a sheet of note-paper folded in the middle.

Novel Flowers.—Specimens of flower dried in alcohol to preserve their colour and affixed to glass and other objects.

Telipsea speciosissima.—Mr. Green, gr. to Sir Geo. MacLay, Tendral Court, Bletchingly, brought a magnificent spike of this noble Protead, the Waratah of New South Wales. The plant was first flowered in 1808, according to the *Botanical Magazine* and other publications of that date, and again in 1838, when it was figured in Paxton's *Magazine of Botany*. Judging from the figures, the specimen sent by Mr. Green is much finer. It is borne on a shrub now about 5 feet in height. The head of clear coral-red flowers is some 4 inches across, and suggests in its general form a *Chrysanthemum* of the incurved section, surrounded by coloured bracts, but of course the resemblance is merely superficial, as the structure is widely different, and the flowers are surrounded at the base by numerous lanceolate concave upturned bracts, with a colour somewhat like that of a *Poinsettia*. A Botanical Certificate was awarded.

Hyacinth Crown in the Dark.—From Mr. A. Smee, Warrington, came a *Hyacinth* which had accidentally grown beneath a stone in complete obscurity. The leaves were blanched, but the absence of light had by no means affected the brilliant deep blue of the flowers.

FLORAL COMMITTEE.—G. F. Wilson, Esq., F.R.S., in the chair. At this meeting Mr. B. S. Williams exhibited a group of new plants which included *Crinum Makoyanum*, a handsome caulescent species with a tall scape having seven large pale rose flowers; *Ronbergia Morreniana*, a Bromeliad with glaucous leaf-stalks and oblong lanceolate green leaves, thick and irregularly spotted with dark green; *Kentia costata*, a Palm with smooth stem and arching oblong pinnate leaves with numerous narrow lanceolate segments; *Dieffenbachia majestica*, a form with long-stalked lanceolate leaves, acuminate velvety green with pale yellow blotches; *Aloesia Putzei*, with stalked hastate leaves, bronzy green on the upper surface, vinous red beneath, with prominent and rather distant venation; *Masdevallia Boddartii*, closely resembling *M. Veitchiana*, but with flowers perhaps larger and paler in colour; and *Aralia Regine*, with palmate leaves divided into five long very narrow shortly stalked segments of a deep blackish-green colour. Mr. James, Castle Nursery, Lower Norwood, had a very highly coloured variety of *Cattleya Mendelii*, a flower of great beauty, which is to bear his name. Messrs. James Veitch & Sons had a remarkably fine white *Rhododendron* named *Forsterianum*, and which is described above. Mr. Woodbridge, Sion House Gardens, staged a fine well grown plant of his variety of *Anthurium Scherzerianum*, with bold vigorous foliage and rich sealing-wax coloured

spaths of the same shape as in Ward's variety, and averaging in size $5\frac{1}{2}$ by $3\frac{1}{2}$ inches in width. Mr. Green brought up from Pendell Court a flower of the rare Waratah, alluded to above, and *Orchis tephrosantha*, a terrestrial Orchid, with the sepals and petals creamy-white sprinkled with purplish dots, the lip divided into narrow segments resembling the limbs and tail of a monkey, but of a deep violet colour; the head of the monkey being represented by the anthers under the cow formed by the sepals. A perpetual flowering Carnation, named Alice Duffield, white flaked with rose, came from Mr. Duffield, gr. to H. K. Mayer, Esq., Winchmore Hill; and Mr. Lyon, gr. to Sir E. H. Scott, Sandridge Court, again sent a sample of the Hybrid Spine Magnolia, showing remarkably good cultivation. From Swanley the Messrs. Cannell brought cut blooms of some fine double-flowered Cinerarias (see p. 495) and Verbena Stars and Stripes, with pipes measuring an inch in diameter, white ground striped with rose, very distinct and very effective. Mr. R. Dean, Ealing, sent some very pretty Primroses named Polyanthuses, and a pretty Primula, named latifolia, an evergreen species, with the habit of an Auricula, but with a triple foliage, and pale magenta flowers with a yellow eye. Mr. Fagg, gr. to Lieut.-Col. Deane, Englefield Green, showed a pure white flowered form of *Dendrobium macrophyllum*, a very fine variety, which is to bear the name of Dearei. From Mr. R. Parker, Tooting, came masses of those two fine *Megasas*, *cordifolia purpurea* and *M. crassifolia media*; and Mr. Chapman, gr. to R. S. Holford, Esq., Westobbit, exhibited cut blooms of a very pretty Tea Rose, strongly resembling Goubault, but which was stated to be a sport from Marie Van Houette.

The awards made were:—

First-class Certificates.

- To Messrs. Veitch & Sons, for Rhododendron Forsteriantha.
- To Mr. James, for Cattleya Mendib Janesianum.
- To Mr. Woodbridge, for Anthurium Scherzerianum, Woodbridge's.
- To Messrs. Cannell & Sons, for Verbena Stars and Stripes.
- To Mr. B. S. Williams, for *Crinum Makoyanum*.
- To Mr. Fagg, for *Dendrobium macrophyllum* Dearei.
- To Mr. R. Dean, for Primula latifolia.

Second-class Certificates.

- To Mr. Green, for *Tropica speciosissima*.
- To Mr. Lyon, for Miles' Spiral Magnolia.

Cultural Commendations.

- To Mr. Green, for *Tropica speciosissima*.
- To Mr. Lyon, for Miles' Spiral Magnolia.

FRUIT COMMITTEE.—John Lee, Esq., in the chair. Good examples of the new Pear, Director Alphon, grown in an orchard-house, were shown at this meeting by Mr. Douglas, gr. to F. Whitbourn, Esq.; and from Chuswick came well kept fruits of fine varieties of Apples—Lane's Prince Albert, Norfolk Bearer, and Norfolk Coleman, evidently the same, and resembling, though distinct from, Norfolk Beauty; and the Essex Apple, also like the former, medium sized and well coloured. Mr. Kershaw, Stead Syke Nurseries, Brighouse, sent examples of a very good seedling Rhabarb, which the committee seemed to think well of.

Royal Botanical and Horticultural Society of Manchester: April 4.—The second show of the series for the current season was held in the Town Hall, and, like its predecessor, under exceedingly favourable conditions of weather. The principal amateur exhibitors were Mr. G. B. Blair, of Whalley Range, and Mr. Oscar Schneider, of Fallowfield. Mr. Blair's plants consisted chiefly of Cinerarias—very capital, also, like the former, medium sized and well coloured. Mr. Kershaw, Stead Syke Nurseries, Brighouse, sent examples of a very good seedling Rhabarb, which the committee seemed to think well of.

very handsome O. Halli led the way, with new assurance of the immense value in England of the "cultivation of the genus of Orchids. Next to it in order of merit came O. Stimpfiana, a splendid species, worthy of its name, the flowers as large as those of O. Halli, but yellow, blotched with bright cinnamon, the lip cordate and pure white, except that the centre is yellow and the apex light rose; O. gloriosum, deliciously fragrant, the flowers yellow, dappled all over with crimson; O. ciriosum, yellow, O. Phalænopsis, O. Alexandrea, O. ciriosum, yellow, all of which genus, with some *Cypripedes* and *Mastodias*, made up as bright a set as the heart could desire. From Mr. Schneider there came also *Sarracenas* in full bloom. Mr. R. F. Ainsworth showed a very remarkable *Oncidium*, from Mr. J. Mason, Warrington, one of the finest of the innumerable fine sports of the Alexandra Odontogloss, that one called *Andersonianum*. The remaining amateur exhibits comprised a grand white Rhododendron, the immense flowers crisp at the edge, called Vetchingham, from Mr. J. Mason, Warrington; and a number of trusses of cut bloom of Rhodod. of *dron javanicum*, coppery-orange, from Mrs. Tootal, of Waste, to which Lady the show was likewise indebted for one of its chief botanical curiosities—a promising species of *Epiglossa*, which the imposing leafage as regards the contingent was consisted in the display of Rhododendrons by Messrs. Fisher, Son & Sibary, of Handsworth, Sheffield. A specimen of one of these Rhododendrons, a deep rich crimson, called Duchess of Connaught, was exhibited in London, and the great credit is shown to it. It has been blooming, more or less, ever since, and it is at this moment, in full bloom again! The variety, nearly as dark, called Duchess of Edinburgh, is almost as full. Another very charming one, Taylori, is pink, as well as bluish; while Princess Royal is purple. In respect of novelty next came the exhibit of Lily of the Valley, made by Mr. T. Jarrook, of the Lily Nursery, Dersingham, Norfolk. In addition to potsful of the usual character, there were great cones, most ingeniously built up, masses of green leaves, and the little white pearls, such as for centre pipes, upon which the variety would rival the most elaborate of epergues. Very few plants would allow of being dealt with in this manner, most kinds losing rather than gaining by this particular mode of treatment, but clearly, in the case before us, the exhibition was not only a success, but a triumph. One of Liverpool, showed an excellent variety of greenhouse miscellanea, Azaleas predominating, also that admirable white-flowered evergreen, sweet-scented, and almost hardy, the *Choisya ternata*; a new hybrid Maidenhair, called Victoria, a charming assortment of *Dalrympis*, many Orchids, and, surpassing all the rest of the lot, the one we have yet seen of the new Anthurium Andraeanum. Messrs. H. Cannell & Sons, Swanley, Kent, were well to the fore with cut Cinerarias, double Cinerarias also, quite a novelty; cut *Pelargoniums*, *Polyanthuses*, *Auriculas*, and other hardy herbaceous plants. Messrs. Cranston, of Hereford, showed cut Roses and the new *Hoya globulosa*. Mr. George, of Putney Heath, London, contributed a trayful of very pretty varieties of Abutilon, flowers deserving well favour. Messrs. Dickson & Co. returned and the pleasant to see, their *Lycopodium* have always given, and came again, with a large quantity. Mr. Thomas Walkden, of Sale, showed *Pansies*, astonishing for the time of year, as well as good intrinsically. Messrs. J. Berry & Sons, of Moss Side, brought new Azaleas, adapted for home use; and, lastly, and not least, a large quantity of the new *Choisy*, at Old Trafford. (Continued from the "Manchester Guardian.")

Royal Caledonian Horticultural: April 5.—The annual spring show of this Society was held in the Waverley Market, Edinburgh, and was in every way a great success. The horticultural exhibition cannot be found in the United Kingdom, and as a general international show is to be held in this hall in September next, it may interest many to know that this spacious building covers 2 acres, is well lighted, and protected from any inclemency of weather that may arise, is easy of access, and very convenient, as the vans containing the plants can be drawn right inside the hall, up to the very places where the various exhibits are to be arranged; it is also situated in the principal thoroughfare, Princes Street, and adjoins the Waverley railway station. The exhibits were not up to the mark, neither were the other bulls. The 1st prize for eighteen in the nurserymen's class was easily secured by Messrs. Downie & Laird. The Azaleas were very good, clean, fresh, and well flowered. The 1st prize for four was just won by Messrs. Downie & Laird. The 1st prize for six was won by Messrs. Paul, Esq., Gilmore Place. The former cut some of the finest good specimens of *Ivyana*, *Model*, *Criterion*, and *Nella*. For six stove and greenhouse plants the same competitors were placed equal 1st, but in the opinion of many Mr. Paul should have had 1st honours. His *Hyacinths* were not up to the mark, neither were the Anthurium Scherzerianum, *Cologyne cristata*, all well flowered; Erica Cavendishiana, a grand piece, and two Azaleas; in the other collection were Anthurium Scherzerianum, not so good; Rhododendron Princess Alice, *Hyacinths*, six to a truss, Erica, and Azaleas. Fine-foilage plants and Ferns were but poorly represented, but table plants were shown well.

Orchids were well shown. The 1st prize for four was awarded to—Macdonald, Esq., Perth (gr. Mr. Dow), who showed four specimens of *Sphegodes*, with nearly forty spikes (a beautiful plant); D. nobilis Odontoglosson crispum, and Phalænopsis Schilleriana; ad. A. Paul, Esq., with *Cypripedium villosum*, *Oncidium serratum*, *Calanthe veitchii*, and *Dendrobium densiflorum*. 1st prize for two orchids: J. Syme, Esq., gr. Mr. Patterson; ad. Mr. Priest, gr. Mr. Martineau. Odontoglosson, One single Orchid: 1st was awarded to Mr. McIntyre,

The Glen, Inverleith, for a small plant of *Odontoglossum Pescatorei*, a small spike of a decent variety, whereby Mr. Paul, who showed *Dendrobium thyrsiflorum* with seven good spikes, was placed 2d.

A table of plants, to the first prize, H. Paul, Esq., whose table contained a choice collection of stove and greenhouse flowering and foliage plants and some good Orchids, some two to three dozen varieties; 2d, J. Buchanan, Esq. (gr. R. Grossart), who showed well, but it lacked the quality of Mr. Paul's.

Deutzias, *Mignolite*, and *Dalrympis* were well done, several good specimens being staged.

Roses, both in pots and as cut flowers, were fairly represented; some beautiful cut blooms of *Niphetos* were exhibited by Mr. Wilson, nurseryman, Kendal. Lily of the Valley and *Strawberry* were well shown, both in numbers and quality. *Cyclamens* were good; the 1st prize was won by Mr. Gordon. The Gardens, Nidrie, for some fine well-grown plants. *Auriculas* and *Polyanthuses* were shown in numbers, the quality being excellent. Alpine plants and flowering shrubs are shown remarkably well. Several various collections contained many novelties of sterling merit. The 1st prize in the nurserymen's class was easily obtained by Mr. Munroe, Jack's Lodge; and that in the amateurs by Mr. Begg, Maiden Lodge, both collections being very meritorious. Bonquets were better done than of former years, the 1st prize was awarded to Messrs. Todd & Co., Maitland Street, the nurserymen's class; ad. Mr. Wilson, Kendal. Dr. Patterson, of the Bridge of Allan, showed a splendid basket of Orchids, similar to that lately presented by him to the public, and contained over thirty dozen species and varieties, and was very much admired.

Fruit was good for the time of year. Good Grapes and Strawberries, likewise Apples and Pears, and a fine Pine came from Mr. Johnston, gr. to the Earl of Strathmore, Glamis, which was 1st. Vegetables were well shown in their respective classes, the 1st prize, for a collection of eight sorts, was worthily awarded to Mr. Gordon, The Gardens, Nidrie.

The various nurserymen contributed largely to the exhibition. The centre of attraction was a fine collection of hardy Rhododendrons, exhibited by Messrs. Downie & Laird; some of these were 12 feet high and 6 inches through, were wonderfully well flowered, and made a magnificent display. The various bright colours mixed well with Azaleas, Palms, &c., and formed a very attractive collection. They also showed their new greenhouse Rhododendron Duchess of Edinburgh, a fine double-flowered white, sweet-scented variety in the way of *Sesteriana*, and the beautiful new Rhododendron (hybrid) Duchess of Connaught, bright intense carmine. The same firm also staged a nice table of Azalea indica and Lily of the Valley. The 1st prize for six or six gr. Rhododendrons were awarded to this firm, also for six greenhouse Rhododendrons; they also took 1st for four Palms, 1st for twelve *Cyclamens*, and 1st for alpine *Auriculas*.

Messrs. Ireland & Thompson showed a very fine collection of miscellaneous stove and greenhouse flowering and fine-foilage plants. This table was beautifully arranged, and was one of the principal features of the show; it contained well-flowered Azaleas, Ericas, Cyclamens, Amaranths, Deutzias, Azalea mollis, Ericas, &c., and some new Orchids, which were well shown, and formed a grand display. The same firm also showed their new greenhouse Rhododendron Thompsoni (Name in open to objection, as there is a wild species called K. Thompson, *Erica*, a pure white free-flowering variety of good habit, strong colour, and well pointed, and a fine-shaped flower. This has been awarded a 1st-class Certificate. They also showed cut trusses of flowers of a new Abutilon, called Waverley, the finest yellow I have seen, said to be of good habit and very free-flowering. Messrs. Downie & Laird showed a collection of Azalea mollis, some of the finest specimens of *Hyacinths*, *Pelargoniums*, Palms, and some good tree Ferns, for which they obtained 1st prize, and many other plants of sterling merit. Messrs. Gordon & Son had a nice table of Lily of the Valley, Fairy Roses, forced *Pelargoniums*, and a quantity of the lovely Primula nivalls. Mr. Taylor, of Leith, exhibited a similar table to that shown by him in Glasgow last week. Messrs. Dickson & Co., Waterloo Place, showed a large table of Cinerarias. The Lawson Seed and Nursery Company showed a fine collection of Palms, *Sprengia*, &c., and some nicely arranged *Ericas* and *Feracae*. Messrs. Dickson & Sons exhibited a table of miscellaneous stove and greenhouse plants. Mr. Palmer, gr. to J. Addie, Esq., Gildingstone, showed a grand display of *Amaranthus*, called Miss Addie, fine shape and substance, intense scarlet colour. A 1st-class Certificate was awarded to this.

It is pleasing to be able to record that this show was in every way a grand success, was well patronised, and the arrangements were excellent, reflecting great credit on the various officers in charge. (From a Correspondent.)

Newcastle-on-Tyne Botanical and Horticultural: April 5 and 6.—The annual spring show of this Society was held as usual in the Corn Exchange and Town Hall on the above dates, and was a decided success in the quality of the various productions displayed, although in some departments it was not peculiar—the competitors were not so numerous as at the spring gathering last year. In the class for stove and greenhouse plants there was a close competition, the productions of the different exhibitors being highly meritorious, and so evenly balanced as to be difficult to choose between them. For four Messrs. Thompson & Son, nurserymen, Newcastle, took 1st, their group consisting of *Imantophyllum miniatum* in good condition, *Erica Victoria* over a feet through, *Dendrobium nobilis* 31 feet and well flowered, with a grandly-grown

specimen of *Cynobulum* (dormant); Mr. J. Brown, gr. to Mrs. E. Joyce, was 2d, having in an excellent collection the yellow-flowered *Erica affinis* and the yellow and brown (orange) sphaerulata, in condition such as it is seldom seen, bearing twenty spikes from 4 to 5 feet long. Four *Azaleas*: These were well shown, Messrs. Thompson taking the lead with large well-flowered examples, amongst which were *Duc de Nassau*, a dense mass of post-ornamental colour, 4 feet across; a Miltonia, still larger; Mr. Methven, gr. to T. Lange, Esq., was 2d, showing smaller but nicely bloomed plants. Two *Azaleas*: 1st, Mr. Methven, medium-sized specimens, well bloomed; Mr. Noble a close 2d. *Hedera japonica* were in such numbers as to form quite a bank, and among all one of the leading. With six, Mr. J. Storie, gr. to T. Hodgkin, Esq., was 1st; and Mr. Noble, gr. to T. Fry, Esq., M.P., was 2d. *Deutzias* were present in quantity and remarkably well done, being large and full of flower. For six, Mr. W. K. Armstrong was well to the fore, having plants alike good in flower and foliage; Mr. Methven 2d. Three *Deutzias*: 1st, Mr. Methven; 2d, Mr. Noble.

Genistas were well bloomed, and, being mostly represented by large examples, were very effective, as also were *Acanths*, of which the old *A. armata* was the best. This category, care-managed and treated, was profusely flowered, and the bloom backed up with an abundance of healthy foliage, is still one of the most telling of spring-blooming subjects. *Dielstras*, *Cinerarias*, and *Ivy* of the Valley, were nicely shown, and present in sufficient numbers to be a core of the exhibition. The numerous classes for cut flowers in the shape of ornamental stands, bouquets, and button-hole flowers, filled a table in the centre of the hall, and collectively were a bright display. Prizes were also offered for boxes of *Camellias* in twos, for *Rhododendrons*, and *Azaleas* in bunches, and for *Roses*, which were all nicely shown.

Florist varieties were well represented, all the most popular varieties being exhibited in good condition. There was a spirited competition in the nurserymen's class for *Hyacinths*. Mr. W. J. Watson, The Hall Nurseries, Fenham, gained the 1st prize in the class for twenty-four spikes, with an even lot of well grown plants; it comprised *General Havelock*, *King of the Blues*, *La Grandesse*, *Kohi-Noor*, *Blondin*, *L'Or d'Australie*, *Von Schiller*, and other good sorts. Messrs. Dewar & Co., and Messrs. Thompson & Son, also exhibited, but the foliage was rather drawn, which told against them, and the arrangement of colour was not so good as that of Mr. Watson's. Messrs. Nairn & Son, Newcastle, were 3d. Messrs. Thompson & Son, Pilgrim Street, also exhibited, they had *Pearl*, a very fine double variety, and *White Pearl*, very distinct. Mr. W. J. Watson, Messrs. Dewar & Co., and Messrs. Nairn & Son, were awarded the prizes in the order of their names for twelve *Hyacinths*.

In the gardeners' class for *Hyacinths* Mr. J. Woods, gr. to H. Middleton, Esq., Fenham Hall, gained the 1st prize on twelve spikes; they were really well grown and in good condition. Mr. Brown, gr. to T. Barnes, Esq., Whitburn, was 2d. The 1st prize for six was awarded to Mr. W. L. Thompson, gr. to Capt. Bell, Wolsington. Messrs. J. Thompson & Sons, Mr. W. J. Watson, and Messrs. Nairn & Son, were the principal trade exhibitors of Tulips, all of them being well grown and in good condition—*White Joost Van Vondel*, *Vermilion Brillant*, *Kaiser Kroon*, *Yellow Pottdecker*, and the white variety of it being the best. Mr. J. Woods had the best Tulips in the gardeners' class. *Polyanthus Narcissus* were shown in capital condition in large pots. Mr. W. J. Watson and Messrs. Thompson had the best.

Arculicas were not so good as might have been expected considering the open weather we have had. Mr. T. Hay, of Hillingworth Colliery, was 1st for twelve distinct good varieties; he had *Frank* (*Simonet*), *Glory* (*Taylor*), *Beauty* (*Trull*), *Lancashire Hero* (*Lancashire*), *Charles J. Perry* (*Turner*), *Complete* (*Sykes*), *Lovely Ann* (*Oliver*), &c. Mr. W. J. Watson was 1st for six, with *Richard Headley* (*Lightbody*), *Smiling Beauty* (*Heap*), and a plant of *C. Lightbody* (*Headley*), which was also awarded a premium, were the best. Mr. Adams of Smallwell, Mr. John Tarnet, of Stocksfield, Mr. E. Oliver, Forest Lodge, Benton, and Mr. W. Sanderson, of Whalton, were also competitors. The single plants in classes were not exceptionally fine, ordinary samples such as *Smallwell*, *Smiling Beauty*, &c.

There were two good collections of twelve alpine *Arculicas* exhibited; the best was from Mr. Hay, who had good plants of *Florence* (*Douglas*), *Prince* (*Douglas*), *Mrs. Dodwell* (*Turner*), *Mrs. Meiklejohn* (*Meiklejohn*), *George Lightbody* (*Turner*), *Daedon* (*Gorton*), *Beatrice* (*Turner*), *Dolly Varden* (*Turner*), and others. Mr. Adams was 2d, and in his collection was a very fine *Queen Victoria* (*Turner*). Mr. Adams was also 1st in the class for singles with a fine *Daedon*. Mr. W. Henderson, *Blaydon Barn*, had the best *Polyanthuses*—*Queen IV.*, *White*, *Formosa*, *President*, and *Queen of Tyne* being the varieties. Mr. W. Sanderson and Mr. R. Jevens, Winton, were also competitors.

THE METEOROLOGICAL SOCIETY.—At the ordinary meeting of the Society, to be held at 25, Great George Street, Westminster, on Wednesday, the 19th inst., at 7 P.M., the following papers will be read:—"Barometrical Gradients—Wind Velocity and Direction at the Kew Observatory," by G. M. Whipple, B.Sc., F.M.S., and T. W. Baker, F.M.S.; "On Difference of Temperature with Elevation," by George Dines, F.M.S.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, APRIL 12, 1882.

- 7.—A very fine bright day. Fine night.
- 8.—Fine bright day. Fine clear night.
- 9.—Fine clear day, blue sky. Fine cold night.
- 10.—Fine day and night.
- 11.—A very fine bright day, sun shining brightly. Fine night.
- 12.—A fine morning; sun shining at times; generally overcast. Fine night; very slight rain falling.

LONDON: Atmospheric Pressure.—During the week ending April 8, the reading of the barometer at the level of the sea decreased from 29.86 inches at the beginning of the week to 29.83 inches by 9 A.M. on the 2d, increased to 29.95 inches by 9 A.M. on the 3d, decreased to 29.94 inches by 3 P.M. on the same day, increased to 30.12 inches by 9 A.M. on the 5th, decreased to 30.07 inches by 3 P.M. on the same day, increased to 30.37 inches by 9 A.M. on the 8th, and was 30.32 inches by the end of the week.

The mean reading for the week at the level of the sea was 30.14 inches, being 0.29 inch higher than last week, and 0.22 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 64°, on the 6th. On the 5th the highest temperature was 52°. The mean of the seven high day temperatures was 58° 2'.

The lowest temperature in the shade in the week was 38° 2, on the 7th; on the 3d the lowest temperature was 45° 5'. The mean of the seven lowest temperatures was 41° 2'.

The greatest range of temperature in one day was 24°, on the 6th; the smallest was 8°, on the 3d. The mean of the seven daily ranges was 17°.

The mean temperatures were, on the 2d, 49° 6', on the 3d, 47° 9'; on the 4th, 47° 3'; on the 5th, 45° 4'; on the 6th, 49° 2'; on the 7th, 45° 4'; and on the 8th, 48° 7', and these were all above their averages by 5° 2', 3° 3', 2° 5', 0° 5', 4° 2', 3° 2', and 3° 3' respectively.

The mean temperature of the air for the week was 48° 1, being 1° 9 higher than last week, and 3° 2 above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo placed in the full rays of the sun, was 136° 8, on the 8th; the highest on the 5th was 95°. The mean of the seven readings was 119°.

The lowest reading of a minimum thermometer with its bulb placed on grass and fully exposed to the sky, was 34°, on the 5th; the mean of the seven readings was 36° 3.

Rain.—No rain during the week.

ENGLAND: Temperature.—During the week ending April 8 the highest temperature was 64° 2 at Cambridge, 64° at Blackheath, and 63° at Truro. The highest temperature at Hull was 53°, at Sheffield 57°, and at Wolverhampton 57° 9. The general mean was 59° 9.

The lowest temperatures in the week were 30° at Hull, 30° 3 at Cambridge, and 34° at Truro. The lowest temperature at Brighton was 38° 5, at Blackheath 38° 2, and at Plymouth was 37° 6. The general mean was 34° 1.

The greatest ranges of temperature in the week were 33° 9 at Cambridge, 29° at Truro, and 27° at Sunderland. The least ranges were 21° 4 at Bradford, 21° 9 at Plymouth, and 22° at Sheffield. The general mean was 25° 1.

The mean of the seven high day temperatures was highest at Cambridge, 60° 7, at Truro 50° 3, and at Blackheath 58° 2; and was lowest at Hull 48° 9,

at Bradford 50° 8, and at Bolton 52° 6. The general mean was 54° 9.

The mean of the seven lowest night temperatures was highest at Plymouth, 42° 7, at Brighton 42° 3, and at Blackheath 42° 2; and was lowest at Cambridge, 36° 6, at Hull 36° 7, and at Wolverhampton 37° 1. The general mean was 39° 3.

The mean daily range was greatest at Truro, 18° 6, at Bristol 17° 3, and at Blackheath and Sunderland 17°; and was least at Bradford, 11° 2, at Plymouth 11° 5, and at Hull 12° 2. The general mean was 15° 6.

The mean temperature for the week was highest at Truro, 48° 7, at Blackheath 48° 1, and at Brighton 47° 9; and was lowest at Hull, 41° 5, at Wolverhampton 43° 6, and at Bolton and Bradford 43° 9. The general mean was 45° 8.

Rain.—The largest falls were 1.15 inch at Plymouth, 0.77 inch at Truro, and 0.39 inch at Sheffield. The smallest falls were 0.02 inch at Cambridge, 0.04 inch at Brighton, and 0.05 inch at Bolton. No rain fell at Blackheath.

SCOTLAND: Temperature.—During the week ending April 8 the highest temperature was 50° 5, at Paisley; at Aberdeen the highest temperature was 52° 6. The general mean was 55° 8.

The lowest temperature in the week was 27° 1, at Aberdeen; at Leith the lowest temperature was 37°. The general mean was 32°.

The mean temperature for the week was highest at Glasgow 44° 2, and lowest at Greenock, 43° 7. The general mean was 43° 1.

Rain.—The largest fall was 0.04 inch, at Edinburgh and Aberdeen. No rain fell at Glasgow, Dundee, or Paisley, and only 0.01 inch at Greenock.

JAMES GLAISHER, F.R.S.

Enquiries.

HE THAT QUESTIONETH MUCH SHALL LEARN MUCH.—BACON.
FUCHSIA SILENDENS.—Can any of your correspondents inform me if the above plant ever opens its flowers? I have tried it in every situation and soil, but cannot get an expanded flower, the buds all dropping.

Answers to Correspondents.

ANGRETTUM ELLISII: S. A large woodcut of this, from a plant in Mr. Day's collection, was given at p. 277, February 27, 1875.

ANTHRUM ANDRAGAE: A. B. R. We have not seen such an occurrence. If the stripe is well defined the plant will prove a great acquisition.—T. T. Pot it in rough peat and sphagnum moss, and while making its growth give it plenty of water at the roots, and a hot moist atmosphere.

ASTRAGALUS: G. M. *Astragalus* forms a very large genus of papilionaceous herbs, of which three are native to this country—*A. glycyphyllos*, a scrambling herb with pinnate leaves, pea-shaped creamy-white flowers, and large pods; *A. hypoglottis*, a dwarf plant with hairy leaves and close heads of purplish flowers; and *A. alpinus*, a similar species, but very rare. The old Greek plant of this name is not known for certain. It probably applied to a plant with jointed pinnate leaves like the vertebrae of the backbone.

ARCTICULA SOCIETY: C. & R. For the Northern Section, the Rev. F. D. Horner, Kirkby Malzeard, Ripon; for the Southern Section, Mr. James Douglas, Loxford Hall, Hford, Essex.

EMIGRATION: G. W. *Worm*. We must decline to undertake the serious responsibility of advising you where to emigrate, or know nothing of your circumstances or capabilities. You should take a moderate view of what you are fit for, and what you are probably able to endure in the way of hardship and climate.

FRUIT TREES: T. W. S., Liverpool. We cannot discover to what you allude. Kindly give the correct reference.

HESLOEK: W. R., Larkhill. The seeds germinate with great freedom in the open air. You could probably get a patch of the seeds from one of the botanic gardens; we do not know any seedsmen who keep it.

MUSAS: An Old Subscriber. *Musa Cavendishi* was, and we believe is still, cultivated at St. John House, Brentford, but we know nothing of the other two sorts you mention.

NAMES OF PLANTS: A. B. *Clinthus puniceus*.—C. B. 1, *Adiantum concinnum*—a large form; probably *A. concinnum* litum; 2, *Asplenium Adiantum*—*Adiantum acuminatum*, apparently, but a poor sample to judge by; 3, *Pteris hastata*; 4, *Cheilanthes fragrans*; 5, no fructification—perhaps *Davallia canariensis*; 6, *Adiantum concinnum*—normal form; 7, *Gymnogramma tartarea*; 8, *Selaginella cuspidata*. Why do correspondents send me such tickets so carelessly, and thus give so much trouble to get at the numbers attached to the specimens? And oh! why will they pack in cotton wool? The reference number should be evident at a glance. T. Moore.—*M. Morton*. *Ceanothus azureus*.—C. W. *Lychis dioica*.—W. Curry. The Norway Maple (*Acer platanoides*).—R. W.

Braid. Amaryllis vittata, we believe.—H. M. Holth-

FELAROGONIUM SEEDLING: Kiddey-pore. No advance

WHITE ELEPHANT POTATO.

THE MOST WONDERFUL CROPPING POTATO IN THE WORLD.

For this splendid Cooking variety we received Certificate of Merit from the Royal Horticultural Society, November 3, 1881.

The True Stock 6d. per pound; 7 lb., 3s.; 14 lb., 5s.; 56 lb. 18s.; 112 lb., 34s.

TESTIMONIALS:

From Mr. E. CLARK, *King's Langley, Herts., October 20, 1881.*
"From the one pound of WHITE ELEPHANT POTATO I have lifted 206 lb. weight."

From Mr. KERRY, *Hallen Hologate, Spibby, October 27, 1881.*
"The one pound of WHITE ELEPHANT has turned out very fine. I have lifted 226 lb. from it."

DANIELS BROS.,
ROYAL NORFOLK SEED ESTABLISHMENT,
NORWICH.

NATIVE GUANO,

SUITABLE FOR ALL CROPS.
Price, £3 10s. per Ton, in Bags, at Aylesbury.

A single 1 cwt. Sample Bag sent, Carriage Paid, to any Railway Station upon receipt of Post-office Order for 5s.

This valuable Manure, prepared from Sewage by the "A B C" process, has been extensively used, for several years, by Farmers, Gardeners, and others, whose reports testify to its fertilising properties.

EXTRACTS FROM LAST SEASON'S REPORTS:—

WILLIAM CRISP, *Gr. to Duke of Marlborough, Bloisheim Palace Gardens, December 12, 1881.*
"Used for Vines, Peach trees, and other fruit trees, also Potatoes, Carrots, Parsnips, Onions, &c. Results: satisfactory. Fruit trees assumed rich dark green foliage, increased vigour, while the fruit swelled up to a very fine size. Potatoes came out in splendid condition; other roots too were benefited by its application. No other manure used with Native Guano. Undoubtedly a valuable fertilising agent, and I shall lose no opportunity of recommending it to gardeners and others."

A. BLAKE, *Hood Gr. to H. Casmore, Esq., The Lilies, Woodon, February 2, 1882.*
"Used for Peas, Potatoes, Onions, Cabbage, Cauliflowers, Celery, Vines, Cucumbers, &c.; Chrysanthemums, Primulas, Geraniums, Fuchsias, &c. Results: Onions, Cabbage, Cauliflowers, and Peas good; Cucumbers, first-rate; Potatoes, a good crop, and I consider it a good manure for pot plants. I think the Native Guano only requires to be more known to the public to be largely used."

Sixteen Prizes awarded at Birmingham Show, 1881.

The Annual Show of Farm and Garden Produce, grown with Native Guano, will be held at Aylesbury in October next. Schedules and Prizes and all particulars, together with testimonials, &c., may be obtained upon application to

The Native Guano Company (Limited), Aylesbury, Bucks.

THE "AUTOMATON"

THOUSANDS IN USE.
SENT CARRIAGE PAID.
MONTH'S TRIAL ALLOWED.
NO CHARGE FOR PACKING.

THE BEST GENERAL PURPOSE MACHINE.

The "AUTOMATON" Lawn Mowers are thoroughly strong, well-made, and durable machines, and the best suited for general work and *Gardeners'* use. They cut the grass perfectly, leave no ribs, but produce a smooth velvety surface on the Lawn, and are light in draught.

The "AUTOMATONS" have front rollers for general work, and *scare rollers* for cutting long grass, or when it is unnecessary to roll the grass in front of the cutters. They have the best machine made gearing, the best self-sharpening knives of steel and iron rolled together, and automatic silent drivers.

R. H. & J. also manufacture "REVERSIBLE" Lawn Mowers for Small Gardens and Borders, and "HORSE-POWER" Lawn Mowers for Large Lawns, &c.

MELBOURNE EXHIBITION, 1881, THE HIGHEST AWARD.

COMPLETE PRICE LISTS FREE BY POST.

STOCK KEPT IN LONDON at Arch 92, Spitalfields Station. Bethnal Green, E., and Machines may be ordered from any respectable Ironmonger.

Ransomes, Head & Jefferies, ORWELL WORKS, IPSWICH.

THE "WORLD" (date "GLOBE") Lawn Mowers are intended for cutting long grass; and, whilst similar to the Lawn Mowers imported from America, have the special advantages of the more accurate fitting and general durability of English manufacture and perfect adjustment.

The "WORLDS" will cut wet, dry, long, or short grass without clogging, and cut off almost all the "beats." They leave the surface smoother than similar machines, and are well adapted for getting over a large amount of work with little labour.

THE "WORLD" (date "GLOBE") Lawn Mowers are intended for cutting long grass; and, whilst similar to the Lawn Mowers imported from America, have the special advantages of the more accurate fitting and general durability of English manufacture and perfect adjustment.

THE "WORLDS" will cut wet, dry, long, or short grass without clogging, and cut off almost all the "beats." They leave the surface smoother than similar machines, and are well adapted for getting over a large amount of work with little labour.

Protect your Glass from Frost and Cold Winds, by using Strong Wall-paper called FRIGI DOMO, which can be obtained from all Nurserymen and Florists, or from BENJAMIN EDINGTON, 2, Duke Street, London Bridge, S.E. Frigi Domo is a registered article, with all Trade Marks and rights.

Wholesale Russia Mat Merchants.

MARENDAZ and FISHER, James Street, Covent Garden, W.C. have received a special importation of new ARCHANGEL MATS; also a large consignment of PETERSBURG MATS, MAT BAGS and RAFFIA FIBRE.

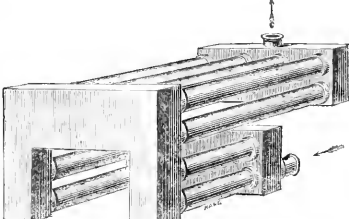

ADIE'S PATENT LAWN EDGER.

THIS Machine constantly employed will pay itself in two days. Has it the *Journal of Horticulture*, says—"This Edge Clipper we have tried, and know not which to admire most—its simplicity or efficiency." Mr. Moore, in the *Florist*—"This new machine does its work rapidly and admirably, the grass being cut with precision, and he further adds, "the use of it will, we have no doubt, become general." Price 30s. PALL MALL LAWN EDGER CO., 15, Pall Mall, London, W.

2-WHEEL HAND GAPPING DRILLS.

Will sow every description of Farm and Garden Seeds. There is no spang and slide to get out of order and damage the seed, being worked by a brush. The rows can also be put in at equal distances without a line. Price, with 2 wheels, 20s. each. " with 1 wheel, 16s. each. " to sow rows, 12d. of each. For larger Manual and Fly Drills, see Illustrated List free from F. BIRD & CO., 11, Great Castle St., Regent St. London, W.

THE THAMES BANK IRON COMPANY
UPPER GROUND STREET, LONDON, S.E.,
Have the largest and most complete stock in the Trade to choose from.

Hot-water Boilers, PIPES and Connections, and all Castings for Horticultural purposes.

Hot-water & Hot-air APPARATUS erected complete, or the Materials supplied.

PRICE LIST on application free.

J. SMITH'S IMPERISHABLE STRATFORD LABELS.

The above Labels are made of a White Metal, with RAISED PLATE-GLOSS FINISH. The *Gardener's Magazine* says—"We must give these the palm before all other plant labels, as the very first in merit." Samples and Price Lists, free. J. SMITH, The Royal Label Factory, Stratford-on-Avon.

JONES'S PATENT "DOUBLE L" SADDLE BOILER.

These Boilers possess all the advantages of the old Saddle Boiler with the following improvements—viz., the water space at back and over top of saddle increases the heating surface to such an extent that a "PATENT DOUBLE L SADDLE BOILER" will do about twice the amount of work with the same quantity of fuel; the cost of setting is also considerably reduced, and likewise the space occupied; at the same time these Boilers are simple in construction, and being made of wrought-iron are not liable to crack. They are made of the following sizes—

CENTRAL TESTS to HER MAJESTY'S BOARD OF WORKS LONDON and DUBLIN.

HOT-WATER APPARATUS for WARMING CHURCHES, SCHOOLS, PUBLIC BUILDINGS, MANSIONS, HARNESS ROOMS, DRYING ROOMS, HOTHOUSES, and BUILDINGS OF EVERY DESCRIPTION.

From Mr. CHARLES YOUNG, *Nurseries, Ballin Hill, S.W.*, May 29, 1875.
"Having given your Patent 'Double L' Boilers a fair trial at my Nurseries, I beg to say that they are most satisfactory. I consider them the best in use, and without doubt the most economical of all boilers; they will burn any refuse of other tubular boilers I have in work."
PRICE LISTS OF HOT-WATER PIPES and CONNECTIONS, with Boilers, of all sizes and shapes; or ESTIMATES FOR HOT-WATER APPARATUS, erected complete, will be sent on application.
J. JONES and SONS, Iron Merchants, 6, Bankside, Southwark, London, S.E.
When ordering Boilers please refer to the above advertisement.

Oil Paint No Longer Necessary.

HILL AND SMITH'S BLACK VARNISH for Preserving Ironwork, Wood, or Stone. (Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertiser, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 35 gallons each, at 12s. 6d. per gallon at the Manufactory, or 15s. 6d. per gallon carriage paid to any Station in the Kingdom.

UNCOLLECTED TESTIMONIAL.
"Pierced Park, 21st Jan. 1876.—Sirs,—I have this day forwarded from Chesham to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierced Park, Chesham.—I am, Sirs, yours respectfully, Wm. Cox."

CUTLEY & HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. S. & S. Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade mark as above, without which none is genuine.

Large Illustrated Catalogue of Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to **HILL AND SMITH, Brierley Hill Ironworks, Staffordshire;** 115, Queen Victoria Street, London, E.C.; and 180, Buchanan Street, Glasgow.

EPPS'S CHOCOLATE.

By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has prepared this delicious beverage which may save many a heavy dollar's cost of a doctor's bill. It is the judicious use of such articles of diet which constitute may be gradually built up, and it is the best remedy for all the maladies attending adult and every tendency to decay wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure Bile and a properly-nourished frame.—*Gen'l Serv's Gazette.*

Made simply with boiling water or milk. Sold only in packets, labelled, JAMES EPPS and CO., HOMEOPATHIC CHEMISTS, London. Makers of Epps's Chocolate Essence for Afternoon use.

HOLLOWAY'S PILLS are securities of health to all nations, of whatever clime. They have given hope, relief, and comfort to millions. In constitutions debilitated by excesses of any kind, or in general prostration of the system, their effect is tonic and restorative. They eradicate from the system the moral cause of ailments, thereby in the frame its pristine animality, health and vigour. They greatly increase the appetite, give tone to the stomach, assist the digestion, and impart elasticity to the spirits; they encourage the circulation, and carried through its course exert its cleansing power over every organ. In the lungs they effect most striking changes, converting the impure venous into pure arterial blood, by which the whole frame is enriched and interstitial deposits removed.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING and COLLECTING MACHINES for 1882.

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her Most Gracious Majesty the Queen on many occasions, His Royal Highness the Prince of Wales, the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. *The "Journal of Horticulture," of June 9, says:—"MOWING MACHINES.—After a critical examination the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. Green & Son, of Leeds and London. As the machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."*

Upwards of 105,000 of these Machines have been Sold since they were first introduced in the year 1856,

And Thousands of unsolicited Testimonials have been received testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

The following are their advantages over all others:—

- 1st. Simplicity of Construction—every part being easily accessible.
- 2d. They are worked with much greater ease than any other.
- 3d. They are the least liable to get out of order.
- 4th. They make little or no noise in working.
- 5th. They will cut either short or long Grass, wet or dry.

Single-handed Lawn Mower.

To cut 6 inches	Price £1 15 0
Can be worked by a Lady.	
To cut 8 inches	2 10 0
Can be worked by a Lady.

Can be worked by a strong Youth.	
To cut 12 inches	4 10 0
Can be worked by a Man.	
To cut 14 inches	5 10 0
Can be worked by a Man.	

Double-handed Lawn Mower.

To cut 16 inches	Price £6 10 0
This can be worked by One Man on an even lawn.	
To cut 18 inches	7 10 0
By a Man and Boy.	
To cut 20 inches	8 0 0
By a Man and Boy.	
*To cut 22 inches. By Two Men ...	8 10 0
*To cut 24 inches. By Two Men ...	9 0 0

*H made stronger, suitable for Donkey, 30s. extra.

Prices of Donkey, Pony, and Horse Machines, including Patent Self or Side Delivery Box, with Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness:—

DONKEY and PONY MACHINES.

To cut 26 inches	£14 0 0
To cut 28 inches	16 0 0
To cut 30 inches	18 0 0
Leather Boots for Donkey ...	1 0 0
Leather Boots for Pony	1 4 0

HORSE MACHINES.

To cut 30 inches	£22 0 0
To cut 36 inches	26 0 0
To cut 42 inches	30 0 0
To cut 48 inches	34 0 0
Leather Boots for Horse	1 9 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machines make little noise in working, the most spirited animal can be employed without fear of it running away, or in any way damaging the Machine.

GREEN'S PATENT "MULTUM IN PARVO" LAWN MOWER.

PRICES.

Without Grassbox.

To cut 6 in. £1 1 0
To cut 7 in. 1 8 0
To cut 8 in. 1 15 0

This Mower is specially designed to meet an almost universal want experienced by those who have small lawns or grass plots, to have a good and useful machine at a low price. The inventor having seen this want continually increasing, year by year, has brought out the Mower to meet the requirements of the public by supplying a good and useful machine at a cheap rate.

It is simple in construction, easily adjusted, is well adapted for mowing small plots, cutting borders, verges, round flower beds, the edges of walks, &c.; it is a most handy, serviceable machine, and very easy to work.

PRICES.

With Grassbox.

To cut 6 in. £1 5 0
To cut 7 in. 1 13 0
To cut 8 in. 2 0 0

GREEN'S PATENT GRASS EDGE CLIPPER. GREEN'S PATENT LAWN TENNIS COURT MARKER.

Specially designed to cut the overhanging grass on the edges of walks, borders, flower beds, &c., and to do away with the tedious operation of cutting with shears.

SIZE and PRICE.

Wide. Diam.	
8 inch .. 7 inch ..	£1 10
Packing Case, 2s.	

This Machine is of novel design and construction, and the simplest and most effective in its operations.

In the trough containing the liquid there is a loose drum which revolves when the machine is in motion, and conveys the marking material to the intermediate pulley, which in its turn transmits it to the front one, so that the ground is marked effectively as the machine is pushed along.

Price, 21s.

Small Bag of Patent Marking Composition, Mat, and Packing, 1s. 6d.

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland.

No Lawn Mower Manufacturer keeps so large a stock of Mowers as is to be found at our London Establishment, 54 and 55, Blackfriars Road, where purchasers can select out of several hundred Machines, of Hand, Pony, and Horse Power, and have their Orders executed the same day they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, free of cost to the Purchaser.

N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London Establishment, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

Garden Seats and Chairs, and Horticultural Implements of every description, Wire Netting, &c., &c.

Descriptive Illustrated Price Lists free on application to

THOMAS GREEN & SON (Limited), Smithfield Ironworks, Leeds; and 54 and 55, Blackfriars Road, London.

Messrs. SHUTTLEWORTH, CARDER & CO.,
191, PARK ROAD, CLAPHAM, S.W.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

THURSDAY NEXT.

CATTLEYA WALLISI (Rehb. f.)

MR. J. C. STEVENS has received instructions from **Mr. F. SANDER** to **SELL** by **AUCTION**, at his Great Rooms, 38, King Street, Covent Garden, W.C., on **THURSDAY**, April 27, at half-past 12 o'Clock precisely, a splendid Importation of

CATTLEYA WALLISI,

probably the rarest Cattleya known. It is a specially chaste and beautiful species, flowers large and sweet-scented, 4 to 5 inches in diameter; the sepals and petals are pure white; the lip also is pure white, with large golden-yellow centre. It grows on very high trees in the Upper Brazils, is extremely rare, and it took Mr. Seidl many months to collect them. Every plant was collected in flower, and the importation is in splendid health. The plants are full of green leaves, and extraordinary masses among them. The opportunity of securing this species may not easily occur again.

CATTLEYA HOLFORDI.

A lovely yellow Cattleya. Flowers 2 inches in diameter, from six to ten flowers on a spike, formed in a bouquet; sepals and petals citron-yellow; lip white, lower part yellow. The variety fastosa, with large purple blotch, and the variety lepidia, with purple veins, are among the importation. Cattleya Holfordi is extremely rare, and probably not in collections. It is many years since it was imported. The plants are in the finest health and the whole offered.

PHALÆNOPSIS ESMERALDA (Rehb. f.)

Professor Reichenbach in describing it says:—"A wonderfully lovely and magnificently coloured novelty." The upright spikes produce from ten to twenty flowers; colour brilliant amethyst; the variety "albiflora," with pure white sepals and petals and rose lip, no doubt be found among the lot. It is a very rare and lovely Phalænopsis, and the plants are in superb health.

ODONTOGLOSSUM ALEXANDRÆ.

A specially selected, extra fine, and large consignment.

The Sale will also contain some extremely rare ORCHIDS, together with fine importations of CATTLEYA ELDORADO and C. SUPERBA SPLENDENS, ONCIDIUM LANCEANUM, and many other valuable ORCHIDS.

On view the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN, LONDON, W.C.

ORCHIDS.

The Largest and Best Stock in Europe of good Established Plants. Tens of Thousands of Plants to select from.

MR. WILLIAM BULL

Begs to intimate that his Orchid-houses are always quite a sight, from the large number of plants in flower, and he will be pleased to show them to any one interested in this beautiful class.

MR. WILLIAM BULL

Recommends those desirous of having their Houses gay with Orchid flowers, to purchase good established well-cultivated plants, which bloom well, are far more satisfactory, and comparatively cheaper than newly imported or semi-established plants.

Establishment for New and Rare Plants, 536, KING'S ROAD, CHELSEA, LONDON, S.W.

Carriage paid to all the Principal Railway Stations in the United Kingdom.

THE Gardeners' Chronicle.

SATURDAY, APRIL 22, 1882.

GERMS AND BACTERIA.

THE part formerly played by electricity seems now likely to be assigned to Bacteria. A few years ago, when any new or strange phenomenon was made known, a ready explanation was found in the word electricity, and most people of an unscientific turn of mind complacently went on their way without giving a longer thought to the matter. Now-a-days "Germs" and Bacteria are accepted by many as the causes of various phenomena with just as little real enquiry. It is not that electricity is really any less potent than before, but the potency of Bacteria is a new revelation. Although the word is getting common, and the effects more and more recognised, the definition of Bacteria is not yet settled, their place in organised Nature not known beyond dispute, their life-history by no means fully unravelled. It must suffice for us here to remind the reader that these Bacteria are, in all probability, plants; they are certainly of extreme minuteness, and of extreme simplicity of structure, and they are probably mere transitory stages of some more perfect organism. Under certain circumstances they exist in prodigious numbers, and under certain circumstances, they bring about changes and diseases in the unfortunate animals or plants into which they gain an introduction. It is natural to suppose that these minute germs are but the accompaniments of fermentation and putrefaction—effects, not causes, and this may be so in some instances. In other cases it has been proved to demonstration that certain changes and diseased conditions arise when they are introduced, and do not arise when by various means their entrance is prevented, or their activity destroyed. By experiments on animals, amongst other means, these facts have been established, and not only this, the means of prevention have been found. One hundred and fifty thousand horses, cattle, and sheep, have now been vaccinated by M. Pasteur and his disciples, and the success in preventing the access of splenic fever, if not absolute, is yet so large as amply to prove the greatness of the benefit conferred. As we have already referred to this matter, explained the *rationale* of the process, and recorded the already vast beneficial results, we need not again enter into details further than to remind cultivators of fruit trees that they have their concern in the matter, since it has been asserted—though the statement requires confirmation—that a particular form of canker in Apple trees is caused by the presence of these Bacteria.

It is our purpose, however, now to once again call attention to an aspect of the matter in which cultivators, whether farmers or gardeners, have the deepest concern—we mean the existence of these agents in the soil and the work they do in it. In some remarks contributed to these columns under the title *How Horticulture*, it was shown by the writer how the difference between the inert "dead soil" and

the "live soil" might be accounted for by the presence of these wonder-working agents in the one and their absence in the latter. Sterile poor soil may and often does owe its sterility, not to any real deficiency of plant food in the soil, but to the absence of those go-betweeners whose office it is to convert the insoluble to the soluble, the useless to the useful. The food may exist in abundance, but for want of proper cooks it may be of no avail to the hungry plants. The actual quantities of certain ingredients taken from the soil by plants are often so small that it rarely happens that a soil does not prove on analysis to contain ten times—a thousand times—more than what would be required for the plants growing upon it. The analysis of a soil by a chemist is, however, one thing, the analysis of the same soil by a plant is quite another. Most soils, for instance, contain as much potash as the plant is likely to require, and yet it is not always yielded up to the plant in sufficient quantities, as is proved by the beneficial results of the application of potash manures. We do not yet know whether Bacteria play any part in the supply of potash in an available form, but quite apart from potash it is certain that we often actually pay for large quantities of fertilisers when there is a more than sufficient supply already in the soil could we but make them available. We do not lay this down as absolute truth, of universal application at all times and seasons; we are far too ignorant as yet to deal in dogmas; still what we have said is, we believe, substantially a correct illustration of a general truth, and represents, so far as it goes, the present state of science on this matter.

The latest publications on the subject are those of Mr. Warington, who lately addressed the Society of Arts on the subject. Nitre, or saltpetre—in chemical language potassic nitrate, or nitrate of potash—is, as has long been known, formed in the soil in large quantities in certain hot countries, and it was ascertained by chemists that this production of potassic nitrate was due to the combination of nitric acid and potash. The nitric acid necessary to form the combination does not exist ready-made in the soil, but is derived from ammonia. Now, when oxygen is added to ammonia (a compound of hydrogen and nitrogen) the ammonia is oxidised, as it is said, and the ammonia becomes converted into nitric acid. Thus much was known for certain, but until the last few years it was not known what brought about the oxidation of the ammonia. Two French chemists, MM. Schlessing and Muntz, in 1877, proved that the formation of nitre in the soil was due to the action of a living ferment. Mr. Warington investigated the subject for himself in Mr. Lawes' laboratory at Rothamsted, and has been enabled to confirm fully the theory just mentioned, and the proof was afforded by the same means as those we have before alluded to. When access of germs was prevented, no nitrification took place; when they were allowed ingress, or when they were purposely added, then the process began: so that in the inorganic lifeless soil, as well as in the organic living plant or animal, these humble organisms play a part of first-rate importance. Mr. Warington having succeeded in producing nitrification at will, proceeds to show how the process may be carried on on a large scale for commercial purposes; and a perusal of his paper among other things suggests the possibility of making our own nitrate of soda, and of thus reducing the cost of this valuable manure.

Another very important aspect of the case is touched on by Mr. Warington; we allude to the purification of sewage. The purification of sewage by the soil depends upon one or more of the following causes:—1, simple filtration; 2, on the precipitation and retention by the soil of ammonia, &c., previously in solution; and lastly, and especially, by the oxidation

of the ammonia and of organic matter by the agency of living organisms (Bacteria). These organisms are abundantly present in surface soils, but are probably absent, or nearly so, from sub-soils, but sewage and farmyard manure contain the organisms necessary for their own destruction, and the supply of the plant with food. The amount of nitrates formed in the soil, and which are so important to plants—inasmuch as it is through them that vegetation derives its nitrogen—is very large, and has formed the subject of special investigation at Rothamsted. There the rainfall, the amount of drainage water per acre, down to a depth of 60 inches, and the quantity of nitrogen in that water have been determined for the last five years; the general result being that nitrates are seen to be produced in large quantities even in unmanured fallow soil, more especially in the hot autumn months; on the other hand, during the rainy months a large quantity of the nitrates will be washed away, to the detriment of the soil's fertility. The growth of any crop on the land checks this outpour of nitrates, first because much more water is evaporated from the soil and the plants together than from the bare soil, so that the amount in the drainage will be diminished, and because the roots greedily take up the nitrate from the soil, so that the drainage waters collected from a Wheat field in June—July were found to contain little or no nitrate—all, or nearly all, had been taken up by the plant. The Wheat, however, ceases to take up nitrates after its season of growth is over, and there is, therefore, the risk, the certainty rather, that the remaining nitrogen will be drained out from the soil. But in the case of root crops the growing period goes on much longer, so that the roots get the benefit of the summer production of nitrates and obviate much of the loss and waste in the autumn. Permanent pasture, where there is a crop on the land all the year round, obviates the loss of nitrates even more effectually. With reference to this waste of nitrogen (valued at about 1s. for 7 lb.) the practical question is, whether it is cheaper for the cultivator to buy nitrates at a high price (the present value is £16 a ton) or to take more or less expensive means to prevent the waste.

It may, however, be within the bounds of possibility that even as we have now the means of effecting oxidation and consequent solubility, so chemists and microscopists may some day be able to tell us how to reverse the process. There are many kinds of Bacteria, and we already know that their life habits are very varied. Mr. Warington himself tells us that while one will ensure the formation of nitric acid, another will only form nitrous acid, an acid containing a less proportion of oxygen than the nitric. There is, then, nothing inconceivable in the suggestion that as some of these organisms are now known to act as cooks and dish up good food to the plants, others may be found to stop or counteract the process. When we have reached that happy stage we shall turn on the nitrogen just when we want it, and turn it off when it is of no more service, just as we have done for years in the case of gas, and we are now doing with the electric light.

New Garden Plants.

RHODODENDRON OLDHAMI, *Maximowicz*.
AZALEA OLDHAMI, *Hort. Veitch*.

BOTANISTS have given up the task of trying to find unimpeachable distinction between Rhododendrons and Azaleas, for however well the deciduous or the persistent foliage, the scaly or the setose pubescence, the five or the ten stamens, may answer in particular cases, they are each and all apt to fail us in other cases, so that there is a pretty general agreement now to include Azaleas as a section under Rhododendron for botanical purposes and further to separate the Chinese Azaleas (§ Azalea proper), with their soft

sticky foliage and five-stamened flowers, from the Indian Azalea (§ *Tsusia*), with their darker firmer foliage usually more or less covered with appressed setae. For garden purposes it is probably better to keep up the name Azalea for both Chinese and Indian sections. No gardener, for instance, would think of calling the present plant anything but an Indian Azalea.

It was introduced from Formosa to Messrs. Veitch's establishment by Mr. Maries, but had previously been found by Mr. Oldham (Coll., n. 212). Maximowicz's description, below cited, was drawn up from imperfect specimens collected by Oldham; it may therefore be desirable to give a further description, taken from the living plant that was lately exhibited by Messrs. Veitch.

A dwarf shrub, densely covered with long brownish strigose hairs, some glandular. Branches slender. Leaves about 2 by 1 inch, some smaller, some larger, spreading, crowded beneath the flowers; stalk about $\frac{1}{2}$ inch; blades lanceolate or oblong lanceolate, tapering to the base, acute or rounded, apiculate. Leaf-buds perulate, young leaves covered with white silky scales. Flowers in a terminal truss, surrounded by deciduous or subsistent concave brownish sticky scales, the inner ones longer than the outer; pedicels $\frac{1}{2}$ inch long, provided, like the calyx, with long, dense, white hairs. Calyx lobes free to the base, lanceolate acuminate, as long as the pedicels. Corolla about 2 inches in diameter, reddish-salmon coloured, funnel-shaped, tube glabrous, furrowed, longer than the calyx; limb irregularly 5-lobed, the three upper lobes forming an upper lip, the two lower a lower one; lobes all oblong, the upper central one larger and broader than the other, suffused with rose-lilac and with numerous small darker blotches. Stamens ten, declinate; filaments of unequal length, slender, reddish, rather shorter than the corolla; anthers minute, purple; pollen yellowish. Style filiform, reddish, longer than the stamens, flattened and curved near the apex. Ovary small, ovoid concave, covered with white setae. *M. T. M.*

THRIXSPERMUM SILLEMANUM, *n. sp.**

A terete-leaved Thrixspermum (*Sarcocilius*), with all the habit of *Vanda* there, but not quite so strong a growth. It has a two-flowered peduncle, which may improve by-and-by. Its flowers are equal in size to those of a good *Thrixspermum falcatum*, or even surpassing the common individuals, as if we have flowered them at the Hamburg Botanic Garden. The colour of them is milk-white with a very slight tinge of the lightest yellow. The square side lacinia of the lip are striped with numerous oblique nearly parallel purple lines. The short retuse fleshy middle lacinia has two purple blotches on its yellow outer surface, and is yellow inside. There is some yellow on the outside of the strong conical spur. Column short, thick, with purple stripes at the base on the inner surface.

I obtained this lovely curiosity from Mr. Harry Veitch, who informed me it came from Mr. J. Sillem, Lawrie Park, Sydenham, to whom it is dedicated with satisfaction. *H. G. Rehb. f.*

[To the best of my belief I received the plant in a case of Orchids a friend of mine procured for me, several years ago, from Burmah, but I do not venture to speak quite positively on the subject, for I have had a good many importations from one part and the other, of which, as usual, I suppose a good many are no more, and I may be in error as to this one. We always supposed it to be *Vanda Hookeri*, but the 'great authority' has pronounced otherwise. It was a long time before we could get it to do more than go on existing, in fact it is only since the last two months, or thereabouts, that it has become a thriving plant. We grow it in the East India-house on a raft,

dilloso-apiculatis, basi in petiolo brevem angustatis, nervis primariis 4-5 arcuatis; lacinia longe prestantioribus concavis; pedicellis sessilibus setosis; internodiis longioribus; pedicellis viscidis setosis; calycibus albidis-setosis setis appressis; calycis segmentis apicibus linearibus acuminatis; corolla (diam. sub tubo calycem duplo superante, limbo sub bilabato, labio superiore trilobo, lobis oblongis obtusis, medio latiore rubro violaceo maculato labio inferiore bilobo); staminibus 10 declinatis inaequalibus; antheris parvis purpureis; stylo curvo; ovario albis exserto; ovario albis setosis; capsula . . . Ex *Inf. Formosa* advenit c. Maries. v. in hort. Veitch. *H. T. M.* *Thrixspermum Sillemianum*, *n. sp.*—Habit *Vandae* tenax, tenerior; foliis teretibus elongatis tenuibus, pedunculo brevibus; lacinia sessilibus, sepalis lateribus campanulatis; oblongo-bilobis; bracteis valde inaequalibus, antheris parvis purpureis; stylo curvo; ovario albis exserto, ovario albis setosis; capsula . . . *Sarcocilius Sillemianus*, *H. G. Rehb. f.*

* *Rhododendron* (*Tsusia*, Planchon) *Oldhami*, Maximowicz, *Rhodod. Asiae Orientalis Novae Act. Imp. Sc. Petrob.* vii. ser. tom. xvi. (1876), p. 34; *Azalea Oldhami*, hort. char. ampliat.—Ramus gracilissimus; petiolis foliisque dense ferrugineo glandulosoque setosis; foliis lanceolatis vel oblongo-linearibus glan-

FIG. 81.—*NEPENTHES DORMNIANA* ×; GREEN, SPOTTED WITH DULL CRIMSON.

to which the roots cling, very much as do those of a *Vanda teres* or *Renanthera coccinea*. *Jar. Sillem.*]

NEPENTHES DORMNIANA ×, *Hort. Williams.*

This is a very fine hybrid, our portrait of which (fig. 81) was taken in the nurseries of Mr. B. S. Williams, of Holloway. The leaves are broadly lance-shaped, acute at the apex, and finely ciliate at the edges. The full-sized pitchers measure nearly 6 inches in length by 3 in breadth, they are flask-shaped, pointed at the base, distended below the middle, tapering upwards into a broad tube, the rim of which is broad, finely ribbed and slightly oblique; the wings are deep fringed at the edges and rounded at the base, the lid broadly ovate, with radiating venation and with a simple spur at the base. The ground colour of the pitcher is green, heavily spotted with deep red blotches, which contrast with the light green of the mouth and throat. It is decidedly one of the handsomest varieties we have had to chronicle. We believe it to be of American origin, but do not know its precise parentage. *M. T. M.*

MASDEVALLIA ESTRADÆ DELICATA, *n. var.*

A new variety, with far more yellow at the base of the upper sepal, and much lighter purple over the base of, and at the base of, the lateral sepals. It was kindly forwarded by Mr. W. Bull. *H. G. Rehb. f.*

ODONTOGLOSSUM SCEPTRUM, *Rehb. f. Wauw.*

When degrading this fine thing to a variety of luteo-purpureum, I may have been guided by some hybrids between the two varieties or species. At all events, it well deserves to rank as a distinct garden form. It is very fine in its clear colours, finest dark lemon-yellow, with well marked blackish-purple rich spots—no hue of that light copper colour one is tired of seeing. The bristle-like calli of the base of the lip are very downy, stand almost in a circle, and have bent tips. The anterior part of the lip is almost circular, much toothed, and very wavy at its base. I have just now a very fine flower at hand, kindly sent me by my very skillful and ardent correspondent, Mr. James O'Brien, who had it from Mr. R. P. Percival, Cleveland, Birkdale, Southport, Lancashire—a gentleman who is regarded by many of my Orchidic correspondents as most enthusiastically engaged in Orchids. The charm of the plant is also founded on its round flowers. *Odontoglossum facetum* comes near it, but the primary type, as it was sent by Mr. W. Bull, is very distinct even by its curious marking. All other specimens of *facetum* I have had in single flowers (alas! when Mr. W. Bull most proudly sent me the whole inflorescence) were really apocalyptic riddles to me, most of all a grand thing obtained from Mr. F. Sander, that may, perhaps, better deserve a proper name. Such abnormal things should not be sent in single flowers. It might do to begin with a single fresh flower, and then, when the family, all the visitors, friends and acquaintances, have enjoyed the wonder, increased by the tale of the fine price paid, the whole inflorescence might be sent to show the constancy of its features. *H. G. Rehb. f.*

ODONTOGLOSSUM LUTEO-PURPUREUM (*Linden*)
AMPLISSIMUM.

This is a very surprising variety, quite a pleasure after those endless monotonous specimens of luteo-purpureum and *l. radiatum*, and *l. radiatum*, &c. It has a very conspicuous flower, with exceedingly broad sepals and petals. The sepals (0.023; 0.05 m.) are striking. The ground colour is a very clear light yellow. There are few cinnamon spots and streaks at the base, and a few very large cinnamon blotches on the disc. Column and rather small lip as usual. It was kindly sent by Mr. Harry Veitch, who had it from W. E. Brymer, Esq., of Dorchester. *H. G. Rehb. f.*

ODONTOGLOSSUM LEEANUM, *n. hybr. (?)*

Scientifically, this novelty ranks beside *Odontoglossum delto-glossum*. It is distinguishable by its far longer and narrower lip. All the colours are distinct. The wavy lanceolate acuminate sepals and petals are of a very bright yellow, with numerous small well-marked cinnamon spots, and a few similar lines at the base. The lip is bright yellow at the base and apex, light yellow on the disc, with a few cinnamon spots. Column light, whitish-yellow and white, with a few small cinnamon markings and falcate subulate apicular wings. There is a linear thick keel at the base of the lip going out in two rhomboid toothletted lamellae. It appeared at the Royal Exotic Nursery of Messrs. J. Veitch & Sons, who wish it to bear the name of that excellent orchidist, Mr. W. Lee, of Leatherhead. *H. G. Rehb. f.*

REGENT GARDENS, DAWLISH.

THESE gardens, which are situated in the fashionable and rising little town of Dawlish, South Devon, and are owned by Mr. Manning, an enthusiastic florist and Grape grower, bear striking testimony to the steady progress of horticulture in its most useful branches in every quarter of the kingdom. Grape growers who have spent half a lifetime in acquiring the art, and many of them even now uncertain upon salient cultural points, should see Mr. Manning's vineeries as an example of what may be done by self-teaching and perseverance. Mr. Manning raised the Vines himself and planted them two years ago last month. The principal vineery is in two divisions, and is about 90 feet long and 15 feet wide, with a run of rafter between 17 and 18 feet.

In the Hamburgh division, where there are twenty-eight Vines planted at 2 feet apart, there are close upon 1000 bunches hanging at the present time, which is a remarkable crop considering the age of the Vines. By the way the Vines were a year old when planted and a batch of supernumeraries occupy the centre of the house, and these of course are bearing fruit from the top of the house down to about its centre, at which point the permanent Vines also in bearing meet them. To an ordinary observer the two sets of plants are not noticed, but under any circumstances the crop is a marvellous one, not so much because of the size of the bunches as because of the fertility of Vines so young and the regularity of the crop. The object of planting so close is with a view to cutting down every alternate cane about every second year and so furnish the house with young wood without losing a crop. But this will hardly be required to be done for some years to come, though such a promising lot of Vines certainly deserve more space, which it is to be hoped the cultivator will have the courage to give them.

Late Vines are also looking strong, but are breaking somewhat irregularly. Several other structures are stocked with plants in variety for decorative purposes and for supplying cut flowers of Pelargoniums, Spiræas, forced Roses, tuberous rooted Begonias, Bouvardias, fine Azaleas in full blow, and Camellias marking their growth. Of luxuries for the table, Beans, Cucumbers, and Strawberries are swelling off crops of average merit, the latter in places where both skill and attention are necessary to finish off good well-flavoured fruits. *Visitor.*

MUCK AND MONEY.

MANURE even more than money forms an integral part of a nation's wealth. No one will deny, I imagine, that manure properly dealt with is a species of wealth; silver and gold are no more than this—we cannot eat them, nor can we clothe ourselves in them. We make them up into articles of use and ornament which we call plate, the value of which over similar articles made of other metals only consists in the greater rarity of the gold and silver over such other metals, not in the greater usefulness of the articles. We also make them up into coins, which we call money, which are valuable only for what they will buy. The following remarks will, I hope, establish in the minds of readers who have not before looked at the subject in this light the close analogy between money and manure.

Money and wealth of gold and silver plate hid in a drawer, or in a hole in the earth (or for the matter of that, hidden for a length of time anywhere), so long as they remain hidden from the sight or knowledge of a community, are of no more use to that community than they were while they remained as ore unmined in the bowels of the earth.

Manure which, after having once been used in the production of food or other produce, is, on the decay of that food or produce, thrown into the river or the sea, in the shape of sewage, is exactly analogous to gold or silver, which after having once been brought to light and made available to man's uses, is again withdrawn from circulation, or hidden in the earth or otherwise lost to man's knowledge or control. The money of a community which is circulated, say, ten times in a certain period for the useful purposes of trade and business makes that community ten times as rich as another community would be made by the same amount of money circulated by it only once in the same period for the same purposes.

The manure of a community which has once been

used and then thrown into the sea can seldom, if ever, again be of use to that community unless it be recovered. In almost all instances of the kind, however, it remains unrecovered practically for ever. Manure used once, and on again and again assuming (in the natural course of things) a manurial condition is again and again used, enriches the community, so using it over and over again. Manure only once used and then lost only once enriches the community so using it.

The mere possession of gold and silver lying idle benefits no one, nor do gold and silver lying unmined in the side of a mountain. The mere possession of manure lying idle in heaps is of no use to any one; nor is the existence of it in rivers or seas, or other places where it is beyond man's control, of any direct benefit to him, though indirectly in certain cases he may receive some benefit from it. The value of coin consists in some measure in its portability; gold being a scarce metal is valuable even in small and very portable pieces, its very portability tending greatly to increase its use and therefore its value; but if it were to become ten or twenty times as plentiful we should have to carry, not only at least ten or twenty times as much of it about with us to purchase the same value of goods as we now do, but somewhat more, on account of its value having been still further reduced because of its greatly decreased portability.

It is the same with manures. Those which contain the essence of a large quantity in the smaller bulk are most valuable, as they can be easily and cheaply sent long distances—their portability being, in fact, such that they can be profitably carried from where they are produced or exist in superabundance, to where they may happen to be required, even though half the world separate the two places. Manure increased to ten or twenty or more times its bulk with water, as in the case of sewage, becomes so unportable that, where it is produced, it is not only of no value whatever, but is indeed so far from being valuable, that it costs large communities very large sums indeed to get rid of it.* Stable manure in the centre of London and large towns, on account of its bulkiness and the expense of carting it from where it is produced to where such a commodity is in request, is frequently valueless; indeed, money has often to be paid for its removal. If by any cheap method the essence could be extracted from stable manure, the product would be a remarkably valuable commodity even in the centre of large towns, because it could then be so easily carried from there to the fields requiring enrichment by its means; only a very small portion of its value would then be consumed in the cost of its transportation. There is another analogy between manure and money. Every one knows that money misapplied is a very powerful agent for evil. It, by no means, however, surpasses manure in this way, which, whether it be misapplied or neglected, is a most active agent in the propagation of evils, such as ill-health, disease and death.†

Manure, then, as I have endeavoured to show, adds like money to the wealth of a community in proportion to the number of times that community makes use of it over and over again; also that, like money, to be of extraordinary value it must also be extremely plentiful; and again, that where it is extremely plentiful, there it is also—as is indeed the case with all other commodities—very valueless unless it can be converted into a portable condition. Manure, however, at the present day and in our country is very unlike money, in that the latter has every care bestowed upon it and is held in the highest estimation by everybody, while manure is to an enormous extent wasted and neglected.

Money is valuable only for what it will buy. If manure were properly dealt with most kinds of produce would be much more plentiful and therefore cheaper than they are now. In other words, the same amount of money would then buy much more than at present. Who can say that it is not quite as profitable for a nation to look as carefully after its manure as after its money?

In England not only is enough manure produced to (under a proper system) sufficiently fertilise every inch of cultivable land in the country, but a large surplus beyond, which should be available for exportation; and as England is continually increasing her imports

* A very small portion of these sums is sometimes recovered by means of sewage farms.

† Improperly treated sewage is known to have brought about in the last few years the serious illness (almost approaching death in one instance) of two members of the Royal Family of England.

of produce (food stuffs, for instance) which after use, in the natural course of things, quickly decay within her, so in like proportion does the production of manure increase too. If manure once received were never wasted, but used again and again as often as it kept reverting to the manurial condition, the supplies of manure would increase in a far more rapid ratio. As produce decays manure results, and manure, properly dealt with, rapidly becomes again valuable produce. The merchant lives by exchanging money for produce, and produce for money, and the more rapidly his exchanges follow one another, according to business rules (other things being equal), the faster he becomes rich.

Man as a cultivator of the soil is continually endeavouring to change manure (*i.e.*, plant food) into produce, and produce is, in the natural course of things, continually reverting (faster or slower according to its kind) to the condition of manure, and when it reaches this it should at once be made use of again, in order that no delay in the circulation of this peculiar kind of wealth may take place.

Scientific men have not only pointed out the necessity which exists for the proper dealing with manurial substances, but also the comparative ease with which they may be so dealt with, but as the general community takes so little interest in the matter, scientific men have hitherto spoken on this subject to a great extent in vain.

If those who, but being exactly what are generally understood by the term scientific men, but who have a thorough appreciation of the importance of this matter, will take it up and lose no chance that offers of rendering its importance known to everybody, they will be assisting to bring about reforms which will not only immensely increase the wealth of the country, but will also tend to greatly increase the health, and therefore presumably the happiness, of the individuals forming its population.

From the foregoing remarks I trust it will appear plain to all readers who have not before given their attention to this subject that manure forms not only an equally but actually a far more important part of a nation's wealth than do its gold and silver. These two metals we might indeed manage to get on fairly well without, but it would be barely possible without manure for large civilised and populous nations to exist.

When this country awakes to a proper appreciation of the facts connected with its vast manurial resources, then it will also perhaps acknowledge another fact, *viz.*, that it has, since it has become populous, lost an infinitely greater amount of wealth through the destruction or loss (for all practical purposes) of manure, than has ever been extracted from all the gold and silver mines in existence since the world began.

The moral of all this is, that our methods of dealing with a very large proportion of the manurial matters of this country (notably the human and animal excrement of large towns) being thoroughly bad, we should at once amend our ways in regard to them, and make a proper use of such matters, dealing with them in an enlightened and scientific manner. When we do this, our towns, cities, and country places will benefit, as before stated, to an immense extent in both health and wealth. This is true. "*Magna est veritas et prevalebit.*" J. E. Ewing, Eaton, Norwich.

RAISED BLINDS FOR ORCHID HOUSES.

DURING the summer months we have found raised blinds very beneficial to the growth of Orchids, especially to those requiring cool-house culture. When the hot summer's sun is shining upon the glass it is very difficult, where raised blinds are not employed, to keep the temperature sufficiently low. The glass roof of the structure upon which the sun is shining becomes very hot, even when shaded with ordinary blinds; but if raised blinds are used a current of air is allowed to pass over the entire surface of the roof, and the glass is kept comparatively cool. The effect of this is to decrease very appreciably the internal temperature of the house; and the moisture, which would otherwise be dried up by the burning heat of the sun, produces a nice humid genial atmosphere, in which Orchids delight. Having thus far referred to the advantages to be derived from the use of this method of shading, we may now explain briefly the mode of construction.

Supposing that the house to be furnished with

raised blinds is an ordinary span-roofed structure, it is necessary in the first place to provide a second ridge elevated about 6 inches above the top of the existing one. This should not consist of a solid plank, but of a strip of timber sufficiently strong to bear the weight and strain of the blinds and roller, and should be supported on blocks of wood placed at intervals, in order to allow the current of air from below to find an outlet, which would not be the case if a solid ridge-board were adopted. Having arranged for the ridge, the next thing is to provide supports for the rollers. Either wood or iron may be used for this purpose, but we have found iron to be the lightest-looking and the most durable. Where the length of the rafters does not exceed say 8 feet, $\frac{1}{2}$ -inch rod-iron will be found to be strong enough, and this should be cut into proper lengths, with the lower end turned up in a semicircular form, so as to catch the roller when it descends, and prevent it running off the supports. These supporting rods should be fixed to the bars or rafters of the house, about 6 inches above the wood-work, by being welded to vertical iron stays, which latter should be flattened out at the base, and provided with holes, so that they can be screwed to the rafters or bars of the roof. In this way a strong support for the blinds to roll upon will be formed; the blinds themselves can be attached to the elevated ridge in the ordinary way, and the gearing usually employed for the purpose will be found to answer well for pulling them up or down. Many Orchid growers have already adopted these raised blinds with very beneficial results. *E. S. W., in the "Orchid Album."*

PANSIES IN SPRING.

WELL-ESTABLISHED plants of these, both in pots and in prepared beds, are now coming into flower with great freedom, and at no other season of the year, except in late autumn, do the blooms show such fine colour and marking. Plants put out in beds in October have become thoroughly well established, and scarcely checked in their continuous growth during the winter, are as healthy-looking and vigorous as they can be expected to be in spring. Such plants, coming into bloom now, should carry on the floral service till July, when the plants may be lifted and divided in showery weather, and planted out in a prepared bed; or, if it be not deemed expedient to do this, cuttings of the fresh young growth can be taken and put into a bed of prepared soil under a hand-light in a cool, shady spot. As a general rule, the most compact-growing plants are those raised from cuttings, and they are better adapted for cultivation in pots than those obtained from divided plants.

Cuttings taken in autumn, winter, and spring, succeed best when put into pots, pressing the cuttings firmly and closely into the soil round the edges of the pots, using a light sandy soil, and pots that are clean and well drained. The pots can be placed in a cold frame in a shady place. The main difficulty with cuttings put in about the month of July is, that the worms will find their way into the cutting-beds, and working among them will thrust the cuttings up out of the soil. It is best to make a raised bed on a cool shady border, and placing something at the bottom that will operate to prevent the worms from making their way upwards. The cuttings must be protected from heavy rains and exposure to the sun; but not sufficiently covered as to cause them to damp off. All depends on the situation, which should be open to the light, but screened from the sun. Harsh, drying winds, such as those now prevalent, should be guarded against. The great advantage of small frames and handlights for cuttings is, that they screen the cuttings from heavy rains, and can be shut down close when desired.

Pansies are somewhat accommodating in their nature, but they do best in a good mellow sandy loam, with which should be mingled some rotten manure that will crumble to pieces, and also leaf-mould and grit of some kind. The Pansy needs a soil in which the roots will ramble freely; a heavy retentive soil will cause the main roots to decay, and the plants are soon dried up under the influence of the warm sun. A soil that is too light is almost as objectionable as one that is too retentive, and needs to be made heavier by the addition of a strong loam, but not clay.

In choosing a site for a bed it is well to select a spot that is shaded from the sun for a time during the day when it is in the meridian. This shade causes

the flowers not only to come finer, but to have the margins better defined. It is this which makes a good show Pansy so attractive.

A sowing of seed of a good strain can be made now. This will give a batch of plants that will bloom in the seedling bed in three or four months, and the best varieties can then be marked for planting out permanently in autumn to bloom in spring. In planting a Pansy bed the plants should be 15 inches apart, as, when they become established, they soon spread, and if at all compact in growth make dense tufts or masses. The leading shoots should be pegged down to keep them from being blown about by the wind, and the value of an occasional top-dressing of good soil cannot be too highly estimated. The young growths root into this, and this one plant, at the time for dividing it, produces many. It is in this way that varieties are propagated more rapidly than by means of cuttings.

If beds of Pansies are made a feature in the garden it is well to keep the show and fancy varieties apart, if some good seed is wanted. Besides, the latter are generally much stronger in growth than the former, and will smother the more spare growing varieties. The gorgeously coloured fancy varieties kill the more refined colours of the show varieties, and so both are seen to the best advantage when kept separate. Among the fancy varieties there are now some exceedingly pretty striped forms that are very attractive in the garden. A selection from these put into a bed by themselves, has a very pleasing effect indeed. The Pansy appears capable of almost indefinite illustration in relation to shades and combinations of colour. Seedlings obtained from seed obtained from the Continent show the possession of shades unknown to those of English growth, and English raisers are taking these in hand and giving solidity and definiteness to the new tints, and size and substance to the flowers in which they are displayed. It is in this way the striped varieties have become so much improved of late. In all the improvements being made, the importance of vigour of habit must not be overlooked. Time was when the flower only was regarded, and a race of poor growing varieties with fine flowers came into culture, and proved disappointing to many. The mistake is being corrected. Habit is receiving more attention than it formerly did; and this once obtained, good flowers will follow as a matter of course. It is better in the long run to begin with habit and go on to increasing the size, shape, and brilliancy of the flowers, than to reverse this process. *R. D.*

FLOWERS IN SEASON.

OUR correspondent "Jack Towel" sends from his suburban garden flowers of *Daphne pontica*, now flowering profusely; the foliage is bright, and the greenish flowers are very fragrant. It grows freely in London suburbs, and is in every way to be recommended.

RUBUS SPECTABILIS.—An old-fashioned Bramble from the same source, with light green pinnate foliage and dark rose-lilac bell-shaped flowers, acceptable for its early blooming, but objectionable in the numerous suckers it throws up.

KERRIA JAPONICA, a very old-fashioned but gay-flowering shrub, with a profusion of yellow flowers. It was at one time called a *Corchorus*, but has nothing to do with that *Tiliaceae* herb.

Berberis sibirica x.—Perhaps the most beautiful of evergreen Berberis: its slender over-arching branches are crowded with deep orange-yellow flowers. It is even more beautiful than *B. Darwini*, which is saying a great deal.

DOUBLE DWARF ALMOND (*Amygdalus pumila* fl.-pl.).—Mr. McMillan, St. James' Road, Kingston-on-Thames, sends from his nursery a spray of this beautiful shrub grown on a bank fully exposed to the north-east, where it has stood uninjured for the last twelve years. It is very like, in general appearance, the *Spiraea prunifolia* fl.-pl., but has larger flowers.

MORICANDIA SONCHIFOLIA.—This remarkably showy and interesting Crucifer is now flowering freely in a cold frame in the herbaceous department of the Royal Gardens, Kew. It is a somewhat recent addition to our list of ornamental herbaceous plants, having been introduced only some six years ago. As a pot plant for cool conservatory decoration it is a decided acquisition, flowering, as it does, at a welcome time, and requiring no special trouble for its successful cultivation. The large violet-blue flowers are freely produced, and the habit of the plant is good. It is a native of Northern China, and was first discovered by the veteran traveller and botanist, Professor BUNGE, of Dorpat, who accompanied a Russian mission to Peking from Siberia in 1831. As above stated, only some six years, however, have elapsed since seeds were first received at Kew; these were sent by Dr. Playfair, late medical officer attached to the embassy at Peking.

GENTIANA VERNA.—This beautiful gem of spring can now be seen to perfection in a sheltered nook in the rockwork at Chiswick. We have some charming hues of blue in hardy spring flowers, as witness the *Forget-me-not*, *Scilla*, *Hyacinth*, *Anemone*, *Omphalodes*, &c., but their richest tints fail to reach that of the beautiful spring *Gentian*. Quite a small clump, carefully planted in good soil in a suitable position, is to be seen flowering in rare form. But it is to be met with in but few gardens, and rarely so well displayed as at Chiswick. It is a plant that requires a little special care, which it abundantly repays; but probably, in the multitude of good and useful plants that in these days flourish with comparative ease, and with but little oversight, something that needs special culture, like *G. verna*, has to give way. Even the more robust *G. acaulis* appears to be gradually disappearing in the South. More's the pity that it is so. Formerly it used to be more the practice than it is now to grow a few things, and grow them well; it is the fashion to grow many, and too often with something below average results.

CHIONODOXA NANA.—A good patch of this pretty bulb is now flowering in the herbaceous department at Kew. Although not so showy as *C. Lucilie* it is nevertheless a lovely little plant, with its Squill-like pale flowers, flushed and keeled with violet-blue. It exhibits a considerable resemblance to *Fuschkinia scilloides*, with which, indeed, it has more than once been confounded. It is the oldest species of *Chionodoxa* known, and is a native of the mountains of Crete, where, at elevations of from 5000 to 6000 feet above the sea, it flowers in May close to the melting snow. It is perhaps hardly necessary to state that, as well as *C. Lucilie*, it is quite hardy in this country.

PULMONARIA SIBIRICA.—The spotted leaves of this charming little plant are very telling in the rock garden in the early spring months, and the flowers (purplish-blue) last over a considerable period, much to the gratification of lovers of hardy plants. It is not a striking plant from a distance, but grows interesting under examination, and taken all in all it is a capital plant for an amateurs' collection where beautiful leaves are usually as much admired as beautiful flowers.

Berberis Darwini.—The beauty of this elegant free-flowering spring shrub is so often adverted to that little remains to be said about it that is either new or culturally interesting. But there are exceptional plants even among common shrubs to be met with that it would be a pity to leave unnoticed. One of these is in the nursery of Messrs. Curtis & Sandford, Torquay, which from its size and form is quite a marvel of natural growth. It is 17 yards in circumference, and from 18 to 20 feet high, so dense in habit as to form a huge circle tapering somewhat loosely at the top. It is smothered with flowers, which are rather late in opening owing to the plant occupying an exposed situation in the nursery. It is, however, so conspicuous an object that the visitor is irresistibly drawn to admire it. It is one of the original plants sent out by Mr. Veitch, of Exeter.

TUSSILAGO ALPINA is just the plant for a rockery, its procumbent habit, neat rounded leaves and cylindrical flower-heads of rosy-lilac thrown up well above the foliage are very pretty.

IBERIS GIBERTARICA is the noblest of the perennial Iberis. Its bold habit and large trusses of white flowers shaded with lilac are very attractive.

LIST OF GARDEN ORCHIDS.

DENDROBIUM.

(Continued from p. 471.)

156. D. MARGINATUM, Teijsm. and Binnend. *Nederl. Kruidk. Arch.*, iii., p. 398.—Native country not given. Buitenzorg Botanic Garden.
157. D. MARMORATA, Rehb., *J. Gard. Chron.*, n.s., ii., p. 492.—Borneo. Flowered by Messrs. Low, who obtained it through their collector, Mr. W. Boxall. Allied to *D. transparens*. Flowers white tipped with purple; labellum purple, ciliate.
158. D. MESOCOLORUM, Lindl., *Bot. Rec.*, 1847, sub tab. 29; Lindl. and Paxt. *Fl. Gard.*, i., p. 63, fig. 13; *Walp. Ann.*, vi., p. 273. Imported by Messrs. Veitch, and flowered by them in 1847. Flowers medium size, white tipped with violet, and having a green blotch in the centre of labellum. Hort. Kew.
159. D. MICRASS, Rehb., *J. Gard. Chron.*, n.s., p. 332.—A hybrid between *D. Wardianum* and *D. florium*, raised by Mr. Seden in the establishment of Messrs. Veitch. Ground-colour pale purple, deeper upwards; lip white, with two dark purple spots.
160. D. (BOLBODIUM) MICROBOLBON, A. Rich., *Ann. Soc. Nat.*, ser. 2, xv., t. 8; Lindl., *Journ. Linn. Soc.*, iii., p. 19; *D. humile*, Wright, *J. Pl. Ind. Or.*, 1843; *D. crispum*, Dalzell, Hooker's *Journ. Bot.*, v., p. 111.—India. Cultivated by Consul Schaller at Hamburg in 1857. Of botanical interest only.
161. D. MICROGLAPHYS, Rehb., *J. Gard. Chron.*, 1868, p. 104.—Borneo. Discovered and introduced by Mr. Hugh Low, and first flowered in the garden of Mr. Wentworth Buller at Strete Raleigh, near Exeter. Allied to *D. aduncum*. Flowers rose-moss, whitish, with five purplish stripes on the lip.
- D. MILLIGANI = *D. striolatum*.
162. D. (STACHYDIUM) MISERUM, Rehb., *J. Gard. Chron.*, 1856, p. 382.—Assam, India. Introduced by Mr. J. Day. Quiescent in fruiting with small, green flowers, and a lip bordered with purple.
163. D. (PEDILONUM) MOHLIANUM, Rehb., *J. Bot. Zeit.*, 1862, p. 214; *Bonplandia*, 1862, p. 334; t. 16; Seemann, *Flora Vitensis*, p. 303; t. 91 (copied from *Endandra*); *J. Gard. Chron.*, n.s., vi., p. 139.—Fiji Islands. First discovered by Dr. Seemann and subsequently introduced into this country by Mr. Peter Veitch. Stems slender, terminated by a cluster of small vermilion flowers. A very striking species.
- D. MONILIFORME, Swartz, *Act. Lin. Soc. 1809*, p. 246; Rehb., *J. Walp. Ann.*, i., p. 777; *Ann. Soc. Hort. de Gand*, iii., p. 215, t. 137; *D. japonicum*, Lindl., *Gen. and Sp. Orch.*, p. 89; *Bot. Mag.*, t. 252; *Orchidum japonicum*, Blume, *Indrag. Bot. Et. Nederl. Ind.*, p. 268.—China and Japan. This has long been in cultivation, though not commonly cultivated. Flowers white, deliciously fragrant, borne on the upper part of the previous year's leafless stems. Hort. Kew.
165. D. MONGHYLLIUM, F. Muell., *Fragm. Phytogr. Austral.*, i., p. 186; Benth., *Fl. Austral.*, vi., p. 282; *D. tortile*, A. Cunn., *Bot. Rec.*, 1839, Misc., n. 33, non Lindl.—Queensland and New South Wales, Australia. A diminutive plant with small yellowish flowers. Flowered at Kew in 1880. Hort. Kew.
166. D. MOOREI, F. Muell., *Fragm. Phytogr. Austral.*, vii., p. 29; Benth., *Fl. Austral.*, vi., p. 281; *Gard. Chron.*, x., p. 139.—Lord Howe's Island, New South Wales. Cultivated by Messrs. Veitch in 1878. Flowers pure white, petals very narrow.
167. D. (STACHYDIUM) MOSCHATUM, Wallich, *Don. Prod. Fl. Nep.* (1825), p. 34; Lindl., *Gen. and Sp. Orch.*, p. 82; *Wall. Pl. Asiat. Kar.*, t. 195; *Paxt. Fl. Gard.*, iii., p. 241; *Bot. Mag.*, t. 387; *Mouder, Botanical*, t. 37; *D. calceolaria*, Carey, Hook., *Exotic Fl.*, iii., t. 184; *Pudry, Les Orch.*, t. 15; *D. unicum*, *Bot. Rec.*, t. 179.—Eastern peninsula of India. Messrs. Sheppard, of Liverpool, received the form figured in the *Exotic Flora*, from Dr. Carey in 1827, and the form figured in Paxton's *Magazine of Botany* is said to have been sent to this country by Dr. Wallich in 1828. I have followed Lindley and others in reducing *D. calceolaria* (not calceolus, as often written) to *D. moschatum*, because, although I agree with the Rev. Mr. Parish that more than one species is represented by the figures quoted, I am unable to give the time requisite to sift the matter to the bottom. The forms hereunder included are all of the finest of the genus, and they are characterised by having a slipper-shaped labellum with a beautifully fringed margin. I think the form having pale orange or tawny flowers, as represented in most of the figures cited above, is a *varietatum*, whilst the *Exotic Flora*, t. 184, and the *Bot. Mag.*, t. 387, are calcularia. In those figures the flowers are strongly veined and tinted with rose. Paxton states that the plant from which his figure was prepared was 6 feet high. Hort. Kew.
- D. MUCKENLATHUM, Blench, *Hort. Dismot.*, p. 156, in adnot.—Received from Calcutta. Allied to *D. crenatum* and *D. transparens*.
169. D. (OSYCHUM) MUTABILE, Lindl., *Gen. and Sp. Orch.*, p. 86; *D. rigidum*, Lindl., *loc. cit.*; *D. tridentatum*, Lindl., *Bot. Rec.*, 1846, sub tab. 64;

- 1847, t. 1; *Bot. Mag.*, t. 6285; *Gard. Chron.*, 1847, p. 175; Rehb., *J. Walp. Ann.*, vi., p. 294.—A very pretty species, having small white flowers tinged or marked with rose, in close panicles at the ends of the leafy stems; labellum furnished near the middle with three white or yellow tubercles or glands. Hort. Kew.
170. D. (AYURHUM) NATHANIELLS, Rehb., *J. Schiller's Cat. Orch.*, 1837, p. 28; *Walp. Ann.*, vi., p. 279; *Aporum cucullatum*, Wallich, *Bot. Rec.*, 1841, Misc., n. 7.—India. Sent to Messrs. Loddiges by Dr. Nathaniel Wallich. Habit of *D. anceps*, but having smaller flowers.
171. D. (ETIOPENDROBIUM) NORTLEY, Lindl., *Gen. and Sp. Orch.*, p. 79; *Sert. Orch.*, 13; *Paxt., Mag. Bot.*, iii., p. 7, with a coloured figure (very large); *D. varicostum*, Lindl., *Sert. Orch.*, t. 18; *Bot. Rec.*, 1844, Misc., p. 48; *Gard. Chron.*, n.s., ii., p. 594, fig. 29.—Chinsya Hills, India. Mr. Roxley brought the original specimens of *D. nobilis* in Macao, China, and it first flowered with Messrs. Loddiges in 1837; and Mr. John Gibson collected the original *D. cœrulescens* in the Khasya Mountains at an elevation of 4000 feet. They flowered at Chatsworth in 1838, and its merits were at once recognised. Hort. Kew.
- D. NOBILE FALLIDIFLORUM = *D. primulinum*.
- D. NOBIUM = *D. Aphrodite*.
172. D. OCHREATUM, Lindl., *Bot. Rec.*, sub tab. 1756; Rehb., *J. Walp. Ann.*, vi., p. 287; *D. Cameraria*, *Bot. Mag.*, t. 28; *Paxt., Mag. Bot.*, iii., p. 295, with a coloured figure; *Bot. Mag.*, t. 4450.—Khasya Hills, India. Introduced by Mr. J. Gibson for the Duke of Devonshire in 1837. It is a handsome species, allied to *D. chrysanthum*, with deep orange flowers in pairs on the leafy stems, and the labellum with a large deep purple-brown blotch. Hort. Kew.
173. D. OCHROLEUCUM, Teijsm. and Binnend., *Nederl. Kruidk. Arch.*, iii., p. 398; reprint, p. 8; Miquel, *Fl. Nederl. Ind.*, iii., p. 636.—Java. Buitenzorg Botanic Garden, 1866. Incomspicuous.
174. D. PALMERI, Lindl., in *Journ. Hort. Soc.*, v., p. 53; Lindl. and Paxt., *Fl. Gard.*, i., p. 48.—India. Imported by Messrs. Veitch. "A charming species, in the way of *D. densiflorum*." Flowers white, with a deep yellow spot at the base of the labellum, which is deeply fringed. Hort. Kew.

(To be continued.)

FORESTRY.

THINNING.—While planting may be regarded as the operation of putting the tree into its proper place and position to grow, thinning may be considered the handmaid to the process of growing it. If a tree is improperly planted, whether as respects place, position, or otherwise, no future treatment, however skillfully or judiciously performed, can ever compensate for the loss or overcome the injury inflicted. But, on the other hand, however well a tree may be planted and placed under the most favouring conditions for growing, the whole prospects may be, and very frequently are, completely blasted by improper and injudicious thinning.

Thinning, like pruning, is a work of primary importance, upon which satisfaction or disappointment, delight or sorrow, pain or pleasure, gain or loss, often entirely depend. Mixed plantations are at all stages of growth more difficult to thin, require more constant attention, and are more easily injured for want of it than those composed of only one species of tree. Different species of trees also require different modes of thinning, and even the same species grown under different conditions require very different modes of treatment.

Thinning may be justly enough regarded as a necessary evil, an antidote for a bane, a cure for a disease, or at the most Art doing under an artificial system what Nature can usually better accomplish if left to do her own work in her own sphere without such aid. It is no sufficient objection to thinning merely that it is an artificial operation rather than a natural one, because the whole system of tree culture whose ultimate object is the fulfilment of some artificial requirement is artificial.

The simplest form of thinning is that of cutting down such growths as interfere with the healthy development, value, and usefulness of the remaining crop, and it is this form of thinning that has probably suggested the term "weeding." There is certainly more reason for the use of the term "weeding" than at first sight appears, for according to Mr. Stevens, the well-known author of the *Book of the Farm*, a weed is defined as signifying a plant growing where it should not grow, or where for the time being it is not desired it should grow. The term itself is, however, of the smallest moment, while the operation and effect is of the very greatest.

The growth of forest trees, as is universally known, is at the fastest a slow process, while, on the other hand, the cutting down, or work of thinning, is the very reverse. Two trees have grown up together, it may be ten, twenty, or thirty years, unmolested, undisturbed, and undangered in any way and in every part, and having thus grown up they have completely adapted themselves to each other and formed powerful attractions, and in a very important manner formed strong affinities for each other.

In this state and condition the two trees are found growing and doing well so far, and so on with other pairs, triples, or larger groups throughout the whole plantation or forest. Why, then, and wherefore, break up this long cherished friendship and disturb the congenial relationship of those trees, since they have grown so long and so well together? The answer, which must of necessity be of considerable length, will, it is hoped, be found in the sequel. Trees, like everything subjected to growth and development, are constantly undergoing change, sometimes more rapid and sometimes less, according to an infinity of prevailing influences which surround them.

In thinning forest trees two primary considerations are to be kept constantly before us. The one is the full, free, and perfect development of every part of the tree, so as to produce vigorous growth and prolonged life in the tree itself. The other is the growing of the tree so as to form the best and most suitable subject for some one or other of the many requirements of art or industry serviceable for man.

In the growing of a group, plantation, or forest, several important changes are gradually yet imperceptibly produced both upon the trees individually and collectively—upon the soil in which they grow, upon the surrounding atmosphere and climate, and consequently upon every subject in the whole neighbourhood and district.

What these changes are, how they are produced, what takes place when the producing causes or active influences are removed, are considerations alike important and worthy of investigation.

It is self-evident that as two or more trees approach each other, which they do in a threefold way, namely, by the points of the lateral branches elongating themselves by annually extending the points of their young shoots; by the roots mixing, interlacing, and sometimes even grafting each other in their subterranean ramifications; and in the annual enlargement and increased diameter of their stems or trunks. Other and different changes are produced upon the soils in which the trees grow, and different species of trees also produce different results.

The changes produced upon the soil may also be regarded as of a two-fold character, namely, chemical and mechanical. The chemical changes produced are alike obscure, difficult to trace or understand; nor has science done much, if anything, to throw light upon the darkness, or reveal what is unknown or hidden. That the constituent parts of the soil are not the same after having produced a crop of wood or timber as they were before, is certain, but whether the change is produced by something being taken out, or something put in, is, and may remain long, a mystery. [See p. 523.] The mechanical changes produced, however, are most observable, and obvious to the senses. The roots of the tree, as they year by year force their way through the soils—first through the active and then through the subsoil—thereby disintegrate the adhesive compact parts, whether of earth or rock, and thus pulverise the soil and admit air and water to mix and mingle with the deeply imbedded substances, thereby altering and changing their composition by a slow but certain process.

All trees, at one or other of their successive stages of growth, are either susceptible of vast improvement by thinning, or of being injured almost to complete ruination for want of it. Some certainly are less injured than others, and some species if once injured can never by any future treatment be at all restored to vigour of growth. Amongst hard woods the Ash tree of all others is the one most easily injured by want of thinning, and most benefited by it; but if once neglected, even for a few years, all its prospects are thereby for ever blasted. Amongst Conifers, the Scots Pine on the hand, either benefits most by thinning, or, on the other, suffers most for want of it.

In consideration of the vast importance the writer attaches to the subject of thinning, he at present concludes with the view of continuing it in due course. C. J. Nichol, *Cullen House, Banffshire, April 15.*

Florists' Flowers.

THE PINK.—This is one of the sweetest of the old florists' favourites, and it is pleasant to know that there are yet many growers of them. Those who have their plants put out in beds, as they ought to be, should now surface-dress them with rich compost. This has also been a good season for them,

beds. The plants are now all above the ground, and growing freely. The surface of the ground must be stirred with a small hoe; the beds require no other attention but to be kept clear of weeds, and to have a good supply of water; indeed, if the ground is dry at the time the plants are pushing through the ground it is a good plan to water the beds, using a rose on the water-pot. Seedling Ranunculi are also very useful, and do not take long to come into flower after the seeds germinate. They grow more freely than the old Scotch varieties, and produce a much greater number of flowers.

THE VERBENA.—The very beautiful and distinct variety of the Verbena exhibited by Mr. Cannell, of

AUSTRALIAN PLANTS.

BARON FERDINAND VON MUELLER, of Melbourne, has published a complete list of the genera of Australian plants, including those discovered since the publication of the *Flora Australiensis*, and the Cryptogams, including "Algs" and "Fungs." In this new example of the Baron's zeal and industry he has given credit to pre-Linnean authors for the genera established by them, thus *Tribulus* is referred to De l'Oisel, *Linum* to Tournefort. Considering that the addition of an author's name is no mark of honour or distinction, but merely a means of facilitating reference and identification, it seems a pity to disturb the confessedly arbitrary arrangement which assigns to Linneus the establishment of the genera in question. At first sight it might seem that an in-

FIG. 82.—THE "BOTHY" AT LAMETON CASTLE, DURHAM. (SEE P. 533.)

If any plants in the beds have died they must be renewed with plants from a reserve kept in pots for the purpose. Those planted out in the spring do not produce such good well-laced flowers as are produced from autumn-planted healthy young stuff. If the weather continues dry give water to them.

THE RANUNCULUS.—I was quite surprised at the strong healthy growth and fine blooms we had from our beds of these last year, and attribute it to the treatment. Our soil is not naturally adapted to their healthy development, but as we had plenty of fine peat siftings from the Orchid peat, mixed with a little chopped sphagnum and a third-part of fine loam, this material was placed on the beds to the depth of 2 or 3 inches, and the roots planted in it to the depth of about 1½ inch. They were planted the same this year, and there are no blank spaces anywhere in the

Swanley, and named Stars and Stripes, deserves more than a passing notice. The flowers were very distinctly striped with white and pale rose, with a sweet perfume. It will be of great value either as a greenhouse flowering plant or to plant out in the mixed flower border. Mr. Cannell has shown us how well adapted the Verbena is for exhibition as cut blooms; it is also grown in pots for exhibition in many country districts. Intending exhibitors of cut blooms about the end of July, or in August, should at once select strong healthy cuttings from the early propagated plants. They will root in a week or so in a hotbed, and with good management they will produce the best possible flower-trusses. Even if the plants are to be exhibited in pots it is much the best way to grow them on from spring-propagated plants. The most successful growers of the Verbena, whether as a bedding, border, or greenhouse plant, trust entirely to spring cuttings. J. D.

justice was done to earlier authors, but it is not really so, because in a monograph their names would be cited with the date of publication. Shakspeare founded many of his plays on prior legends, or even dramas, yet no one for general purposes cites any other authority for, say, *Romeo and Juliet*, than Shakspeare. In historical dissertations, however, the sources of Shakspeare's inspiration are very properly noted. As to the limits of genera "four decennia" of systematising have led the Baron to preserve large genera rather than split them up into smaller groups, the characters of which are not easily remembered. Genera are considered as artificial aggregations, while species are treated as natural groups, accepted with a limitation equivalent to that of *Ardea herodias*—of man himself. The genera of Australian plants amount to 2122, a number that might be readily doubled by those whose views tend in the opposite direction to those of Baron von Mueller. No fewer than 300 authors have, it appears, stood sponsors for these genera.

Orchid Notes and Gleanings.

WORK IN THE HOUSES.—The prospect of a good show of flowers in the East Indian-house may now be pretty accurately judged, as the greater part of them, being summer-bloomers, will be showing their spikes freely; and while these are young and succulent extra precautions must be taken to prevent them from getting spoiled by cock-roaches or any other pests. Where a regular supply of choice flowers is required during the London season few plants can surpass the different kinds of *Acridies* for this purpose, especially those kinds that throw short spikes and plenty of them. Among the best of these are *A. odoratum*, *A. Larpenae*, *A. virens*, and *A. Schröderi*. The last-named is a scarce plant, but it is one of the best for cutting purposes, as it throws a stiff closely branched spike that stands nearly erect on the plant. Of the kinds that throw out fine branching spikes *A. Lobbiai*, *A. Fieldingii*, *A. affine*, and *A. Veitchii* are among the best, but they are not so useful for cutting. While the above are developing their spikes they should not be allowed to suffer from the want of moisture at the roots. Where it has not been retarded, the late-flowering form of *Angraecum sesquipedale* will now be going out of flower, and the plants should be well cleansed, and afterwards re-surfaced with clean sphagnum moss. This is a shy-rooting plant, and requires very careful handling when interfering with its roots. It should be placed in one of the warmest positions in the house. Any of the *Vandas* that have been removed from this house while flowering should be brought back as soon as their beauty is over, placing them in the coolest end of the house. One of the most distinct and beautiful in this genus now flowering is *V. Denisiana*. The *Dendrobiums* will now demand a good share of attention, as some of the earliest will be making rapid growth, and must not be allowed to suffer for lack of moisture either at the root or in the atmosphere. Others will be just starting into growth, and must not be too freely deluged with water, and particular care should be taken not to damage the young growths by allowing any water to hang about them. Any just going out of flower should be repotted or top-dressed, if they need it, without delay, as once they start into growth their development is very rapid. Those intended for the latest flowering must still be kept dry, unless the spikes show that any further retarding would be injurious, when a slight moistening of the material about their roots will assist the plants to perfect their spikes. Two of the most useful *Cattleyas*, *C. Mossiae* and *C. Mendelii*, will now be pushing up their flowers, and a very slight increase of moisture at the root will be beneficial to them, and the plants should be well up to the light while they are developing their flowers. *Cattleya Warneri*, *C. crispata*, *Laelia purpurata*, and others, that are far advanced in their growth, will take a maximum supply of water at the root, and a good supply of atmospheric moisture will assist in bringing their growths to the highest perfection. As the majority of the plants in each division will now be making growth, a mild and constant circulation of fresh air should pass through the houses; but this should never be admitted to such an extent as to seriously affect the humidity of the atmosphere. *J. Roberts, Gunnersbury.*

CYMBIDIUM EBURNEUM.—With us this grand Orchid grows finely in the Cattleya-house, where the night temperature ranges from 50° in winter to 65° in summer, and when it can be flowered well year after year. I venture to say it can scarcely be equalled by any other Orchid. I have heard from many sources that hitherto this plant has not come up to expectations in point of flowering. Here the case has been very different, and nothing could well have been finer than the display of blooms this year, a few plants in all sizes bearing about eighty spikes. The plant (fig. 78, p. 497) bore last year seventeen spikes, this year twenty-one, and some small plants growing in 45's and 32's have even this year borne two strong spikes. They are all grown in rough fibrous peat, with plenty of broken pieces of charcoal and crocks, and it is most important that the drainage should be perfect, an abundance of water being required throughout the year; in fact the plants must never be allowed to get

dry. Some of your correspondents, whose remarks I have always read with great interest, have at different times recommended growing them in a compost principally of loam, and I have no doubt but they have done well with them. We have never used it here, for the simple reason that our plants have year after year grown fairly well, and have flowered excellently, and we have thought it best not to alter our treatment. *J. Mill, The Gardens, Reddisham Hall.*

ORCHIDS AT KEW.—Seeing a note on one of these in last week's issue, I send you one on the rest of the collection. I was there on the 15th, and was much pleased to see the improvement in the collection in the last eight months. Among others in flower were as follows:—*Cattleya Trianae* (a good lipped variety), *C. citrina* (two pairs of blooms and one single one from three good leads); *Celia Baueriana*, *Coleogyne cristata*, *C. cristata Lemoiniiana*; *Cymbidium eburneum*, *Cirriophorum picturatum*, *Chysis bracteensis*, *Cypripedium barbatum*, *C. hirsutissimum*, *C. villousum*, *C. Roezlii*; *Dendrobium crassinode*, *D. crepidatum*, *D. Farmerii*, *D. crystallinum*, *D. Jamesianum*, *D. fimbriatum oculatum*, *D. litiiflorum*, *D. macrophyllum* (several large varieties), *D. Pierardi*, *D. nobile* (a fine bold variety, well marked as to depth of colour), *D. Wardianum*; *Epidendrum bicoloratum*, *E. erectum* (a very pretty species); *Gongora bufonia* (a peculiar and beautiful Orchid, well worth a place in all collections); *Ionopsis paniculata* (a little two-bulbed piece, having a fine panicle), *Masdevallia ochthodes*, *Maxillaria luteo alba* (a fine specimen, full of flower), *M. variabilis*; *Odontoglossum biconiense*, *O. maculatum*, *O. Pescatorei*, *O. Cervantesii decorum*, *O. pulchellum* (very fine), *O. claviceps*; *Oncidium abortivum*, *O. Batemanianum*; *Pontipha maculata* (this is the Orchid referred to last week), *Phalenopsis amabilis*, *P. Schilleriana*; *Phaius grandifolius*, *Sophranopsis grandiflora*, *Spathoglottis species* (very like *Lobbiai*), *Sobralia Galeottiana*, *Thunia alba*, *Vanda suavis* (several well bloomed), *V. tricolor*, *V. tricolor insignis*—this last plant was quite a sight alone, being over 4 feet high, well clothed with leaves, and spikes in bloom and bud, viz., four, bearing respectively thirteen, ten, ten, seven, and large in proportion. The spotting is very good, and the plant is a specimen. There is also a plant of *V. tricolor* deserving of special notice for its dark round flowers, that attract one's eye at once from the six or seven examples of *V. suavis* in the same house. It is gratifying to see the old garden's collection thus improving in tone. It is to be regretted that there is so little space devoted to this grand order of floral aristocrats. There being no Mexican or Peruvian houses cool Orchids cannot be cultivated, but people begin to hope these houses will not be wanting long. Even the present ones could be better filled with greater variety, there being some dozen or more large plants of *Angraecum eburneum virens*, besides many others, smaller. Were these exchanged for others with private growers the collection could be improved with no expense whatever compared to the benefit thereby gained. I noticed also a great acquisition there in the shape of *Cattleya labiata*, marked "the old variety," a rich five-bulbed plant, breaking well. This, I believe, has arrived lately; also some newly imported *Dendrobium Wardianum* and *Cattleya Warneri*, the latter, I think, from Low's, by the look of them. It is pleasant to watch the movement upwards of the nation's yet very small collection, but I hope next note I send you to be able to enumerate more variety in bloom and yet greater steps forward. The health of the plants is better in all respects. *D. B. C.*

DENDROBIUM PULCHELLUM.—It is not often that such a fine specimen is seen of this pretty little Orchid as one which was sold at Stevens' Rooms on Thursday. The mass of strong healthy growths measured 18 inches through, and was an almost perfect mass of pale translucent blossoms. It is one of the cultural triumphs of the Hon. and Rev. J. Townshend Boscawen.

THREE-LIPPED DENDROBIUM NOBILE.—Mr. B. S. Williams sends us a flower, received from H. Knight, Esq., wherein the two side petals have assumed very much of the colour and markings of the lip proper, and is also perfumed like *D. heterocarpum*. Such malformations are not very uncommon in Orchids, and are botanically interesting, while the florist may see in them indications of the possibility of producing regular flowers. For our own part we should be sorry to see Orchids brought under the florist's standard, but if it be so desired such flowers as that before us show the possibility of the feat.

The Flower Garden.

BEDDING-OUT PLANTS.—The stock of these should now be closely looked over, and any deficiencies provided for by immediate propagation. This applies principally to sorts usually required in large numbers, such as *Mesembryanthemum cordifolium variegatum*. This propagates quickly with the aid of a slight bottom-heat, and is soon ready to harden off for use. The whole stock should at present be kept under glass at night; so also should *Coleus*, *Iresine*, and other like tender subjects. Cuttings of spring-struck *Pelargoniums* have had an unusually favourable season, and are now in fine condition for transferring singly into small pots; at the same time provision may be made for further contingencies by filling a number of boxes with spare cuttings, which will be found useful at planting time, to be transferred at once from box to border.

SOWING, PLANTING, AND PRICKING-OUT ANNUALS.—The welcome rain has come at last, bringing the soil into a fine condition, so that all arrears of sowing, particularly of the finer sorts of hardy annuals, should be finished off at once, and those which were sown early in pots may be planted out at once. Early-sown tender annuals should all be pricked off on a gentle bottom-heat. The sorts most requiring this particular attention are French and African Marigolds, *Helichrysum*, double and single *Zinnia elegans*, very beautiful in beds, and harmonising well with others in the mixed borders. *Tagetes signata pumila*, a most useful plant, should also be so treated; indeed a large amount of space furnished with a gentle bottom-heat should now be at command for pricking out rooted cuttings of *Alternanthera*, *Lobelia*, seedlings also of the same, *Asters*, *Phlox Drummondii*, *Gaillardia*, *Petunia*, and *Golden Feather*. This latter, however, is such a free grower, that if care be taken to sow the seed early under glass, but without bottom-heat, plants quite large enough for bedding out may easily be obtained.

SUBTROPICAL GARDEN.—Much room is now required for established and advancing plants in this department, and there are many of the earlier-potted and well-rooted plants which may be transferred to cooler quarters, such as *Ricinus*, *Wigandia*, *Humea*, *Canna*, *Chamaepeuce*, and the like; these will make room for the advancing stock of the same, which it is necessary to bring forward into a condition to allow of their being well hardened off as soon as possible; in fact, this will be a subject requiring very strict attention for the next month or so, as it is ruinous to plants to transfer them suddenly from a heated temperature to the open air. Whenever spring gardening is carried out to any extent it will be some time yet before the spring occupants can be transferred to the reserve garden, or, as in the case of bulbs, be lifted with safety, but the season being an early one these will be ready sooner than usual, and no time should be lost when the beds are ready to prepare them for their summer occupants. Most of the subtropicals require extremely good and deep soil; it should therefore be highly manured and deeply trenched as soon as possible—but the beds intended for the general run of bedding plants need not be highly enriched, as the object sought is an abundant inflorescence, and not rampant growth like subtropicals.

VIOLETS.—Where strong plants of these are required for potting and early frame work in the autumn the present is the most eligible time to prepare them for the purpose by selecting strong rooted layers of *Neapolitan*, *Lee's Victoria*, and *The Czar*, and planting them in rows in the open quarters 18 inches apart and 1 foot in the row, at the same time the weaker layers will serve admirably for planting in beds for spring flowering. The beds should be changed occasionally, and a fair amount of fertilising matter be incorporated therewith during the process of preparation; water is an absolute necessity, and in dry weather they require a constant supply. This matter should have immediate attention, as if relegated to the busy bedding-out time it is apt to be left too long for the plants to attain the necessary strength for potting purposes, &c. *John Cox, Redleaf.*

The Orchard House.

The stoning period is generally considered to be the most critical in the growth of Peach, Nectarine, and other trees, and it is usual to leave a considerable number in excess of what the trees will really bring to perfection until this period is over. My own experience is, that when the trees are maintained in good health, and have no check to their growth from want of water at the roots, or too much of it owing to defective drainage, the fruit will not drop off, and it may be thinned out more freely in the early part of its growth. As soon as the stoning period is over, the fruit, which had been apparently stationary during the previous six weeks, will begin to swell freely. The temperature at night may be increased to 65°; the trees syringed freely with tepid water night and morning, shutting the house up as early as possible in the afternoon. If the trees are grown in pots they should be surface-dressed as soon as the fruits begin to swell. I have previously described the best material for surface-dressing; it is that recommended by the late Mr. Rivers, viz., one part horse droppings, one part mull or kiln dust, and one part loam; make a heap of this large enough to ferment, and if it is dry, throw a few pailfuls of manure-water on it. Take care that the mass does not heat too violently, or its rich manurial properties will evaporate. In the late house the blossoms are now all over, and in the house here we have had a good set, without the use of any artificial heat. Although there were frequent sharp frosts when the blossoms were opening, the warm sunny days raised the temperature sufficiently to keep it well above the freezing point through the night. We now syringe the trees freely with the garden engine early in the morning, admitting air immediately after, and also in the afternoon as soon as the house is closed. Strawberries on the shelves are now coming on rapidly, and where the plants in pots have been standing close together one half of them ought to be removed to give the others sufficient space to develop themselves; if they are crowded too closely together they will not produce good fruit. Give them plenty of water now, and weak liquid manure at each alternate watering. Syringe freely until the blossoms open, when it is best not to syringe them any more until the fruit is set; afterwards syringe twice a day with the fruit trees. *J. Douglas, Lexford Hall, Ifford.*

The Pine Stove.

SOME discrimination is required to ascertain the proper time the plants require water, and close observation should be made before this is done. Plants in different stages and grown under different conditions vary considerably as regards the state of moisture at their roots, therefore watering is not an operation that can be done by rule. Where plants are grown plunged in fermenting materials they require less water, and the soil invariably becomes drier towards the surface. On the other hand, plants plunged over hot-water pipes or in close proximity to flues require more water, and the soil of these becomes drier towards the base of the pots; and when these different conditions are kept in mind they materially assist in determining the time water should be applied to the roots to keep the soil in a uniform state of moisture. Instead of frequently looking over the plants and disturbing the soil, which if indulged in breaks off some of the most active roots, make a thorough examination of all the plants at least once a week, and this is sufficient for all practical purposes even in the summer months. In ascertaining the true state of the soil it should be examined some distance down the pot, as the surface soil becomes wet by syringing or other influences from evaporation; there are also fewer roots towards the surface to absorb the moisture. A good and safe plan is to knock out a plant or two, when the true state of the soil and roots can be accurately tested, but this is not necessary every time watering is done. Pines should at all times be plunged, as the roots are kept in a more equable state and are not exposed to those sudden transitions which are inevitable if the pots are affected by currents of cold air and the scorching rays of the sun. Modern growers have pronounced against the mixing of any kind of manure with the compost, with the exception of a little soil, or bones, or bone-meal, and we think the verdict a sound one. Therefore all feeding and stimulants have to be applied in the shape of liquid manures. When using these it is

better to apply them often in a weak state than apply it less frequently in stronger doses. Disproportionate and unsightly crowns are often the results of injudicious applications of liquid manures. Good guano may be used, but sheep or deer droppings can always be relied upon; these should be gathered in a fresh state, and soaked forty-eight hours before using; in this time they are dissolved sufficiently to pass through the spout of a can or a long tube, when the same can be diluted according to the strength required. We use an 8 or 9 inch potful of fresh droppings so dissolved to water ten fruiting plants, and for succession plants it is made weaker, according to the quantity of roots and the size of the plants. As soon as the roots of succession plants get to the sides of the pots, liquid manure is given them in a weak state, and gradually increased in strength until the fruit commences to colour. When watering, if the water stands on the soil and does not enter in the usual way, but is noticed to bubble, it must be taken to mean that the ball is very dry, and an extra watering should be given them. After minute tests, we find that liquid manure given very strong, although not killing the roots, does not aid in swelling the fruit, but has the contrary effect, producing small fruit with large crowns. The plants also assume a yellow, unhealthy colour, and this is a sure symptom that they are either getting too much liquid manure, or otherwise too much moisture at the roots. If these conditions are not changed, all other good culture will be counterbalanced. *D. Wilson, Castle Hill, Devon.*

The Hardy Fruit Garden.

THIS season's prospects are in this department more promising than those of several years past; the fruit blossom is even more plentiful than it was last year, and the rather sharp frosts of the beginning of the month seem to have done less injury than might have been expected. Plums and Cherries are excessively full of bloom, far surpassing their usual prodigality in that respect; and every care should be exercised to ward off the disastrous effects of any late frosts we may chance yet to experience, by having protecting material in readiness to apply on emergencies; but it will be well not to protect those later blooming and harder fruits regularly at nights irrespective of the state of the weather, for by ill-considered shelter an amount of tenderness may be induced which tends to produce the very result it is intended to prevent. Pears appear to be an exception to the rule of general fruitful promise; some trees exhibit but an indifferent show of bloom, and especially is this the case of trees that bore heavily last year. If the mild weather continue it will be advisable to remove any light protecting materials, such as herring-nets, that may have been left upon Apricot walls until now, but temporary coping boards may be retained a little longer, and will prove useful in the event of sudden changes of weather. Keep a sharp look-out after the maggots amongst the leaves, and commence shortly to remove some of the worst placed shoots in young trees, also some of the grossest growths from such parts of established trees as require to have their extra luxuriance repressed, in order to maintain or correct the balance of the branches. Any protection afforded to Peach trees, if of a heavier character than that of a single ply of wide-meshed netting, may now be removed, and only that of a light form retained. Let the garden engine be now frequently used with tepid water during mild weather to thoroughly cleanse the trees, and prevent the establishment of insects; and where this means is insufficient to prevent the spread of aphides use an insecticide without further delay. Soft-sap should be either boiled or mixed with boiling water, and left to stand all night before being added to the quantity of water to be used; for, adhering to the tender leaves and shoots of Peaches and Nectarines will be found to deface and injure wherever they rest. Complete at once any grafting that may be in arrears; as it is now getting late for performing the operation, and it is only where scions and stocks have been duly prepared, and consequently retarded, that success may be confidently expected. Look to all grafts put on last month, damping the

clay to prevent its falling to pieces through cracking, re-mossing where insecure fastenings or the work of birds have rendered such attention necessary; and look out for weevils, which frequently take up their quarters amongst the moss, and sally forth at night to feast upon and destroy the young growths of the scions as soon as the buds burst. Make the soil firm around any cuttings of bush fruits that have been inserted during the autumn and winter; for although this operation is not so necessary as it would be after the upheaving effects of severe frosts, yet it is of advantage to make certain of their stability, and thus hasten their establishment as rooted plants. Trimness and neat keeping should be especially attended to in the hardy fruit department at the present time, when the beauty of the plentiful blossom in its varying tints invites close inspection, and rivals in effectiveness the purely ornamental departments. Box edgings may now be cut with every prospect of the period of frosts being past before the growth starts afresh. The ordinary hedge-shears are yet used in some gardens for clipping the edgings, but either a short stiff scythe or the grass edging-shears will be found a preferable instrument for cutting the sides, getting over the work more speedily and effectually, and leaving only the top to be trimmed off with the shears. No form is more pleasing to the eye or better calculated to insure a close lase than the wedge shape, which either of the tools mentioned above will readily produce, and if the sharp apex be cut off as recommended, as perfect an edge will be formed as can be desired, provided that the work be done neatly and annually. *Ralph Crossling, St. Fagan's Castle.*

Grapes and Vineries.

THE earliest Grapes will now be nearly ripe, and must be kept in a drier atmosphere. Damp down the paths and borders early in the morning on bright days only. When there is a good supply of air on, keep a little on the back and front ventilators day and night, and increase it as the temperature rises. Keep a little fire-heat on, even on the brightest days, as it will make the atmosphere more light and buoyant. Keep the night temperature at 65°, with a rise of 10° by day. If the border is dry, water with clear tepid water at 85°; but if the border was watered when the Grapes commenced to colour, it is generally sufficient until they are ripe. Keep the evaporating-pans dry, and let the laterals grow within reasonable limits. Succession Hamburgs that are swelling will take liberal supplies of tepid manure-water at a temperature of 85°, giving plenty of atmospheric moisture, and keep the evaporating-pans filled with weak manure-water. Look over the bunches, and take out small or stoniless berries. Give air early in the day on the back ventilators, and close early in the afternoon. Hamburgs that have just been thinned must have a good soaking with tepid manure-water, and the temperature kept at 65° by night, with a rise of 10° by day. Later houses can be disabused and the shoots tied down as they require it, being careful to leave only those shoots that are best placed. The latest house must still be kept as cool as possible. See that none of the young growths touch the glass, for every little frost will catch hold of them. Do not close the house for the present unless there is danger of frost. Young Vines planted last month will take liberal supplies of clear tepid water and a moist, growing atmosphere. Let them run to the top of the house before stopping, which will fill the border with healthy roots. Syringe the paths and Vines overhead when closing in the afternoon. Any vineries with outside borders only, will be better if not planted before May, as the soil will then be warmer, and they will make better progress afterwards. Muscats that are swelling their fruit can be kept at a night temperature of 70°, with a rise of 10° by day, giving the borders when dry liberal supplies of tepid manure-water. Keep a sharp look-out for red-spider, and if it appears sponge the leaves with clear water; raise the temperature early in the day, and give air early, say at 7.30, steadily increasing it as the heat rises. Close early in the afternoon with abundance of atmospheric moisture. Late Muscats will now be coming into flower, and can be kept at a night temperature of 70°, with a rise of 10° by day. Give the border a good soaking with clear tepid water before they come in flower, and do all the stopping, so that they will not require stopping again until they are set. Raise the heat early, and give air on the back ventilators early in the day. Damp the paths and borders early on bright days, so that it will dry up before mid-day, and the atmosphere be light and dry. Tan the roots several times daily to disperse the pollen, and damp the paths and borders at closing time. Late varieties of Grapes must be tied down and stopped as they require it, stopping them at about four joints beyond the bunch; leave only sufficient growths to cover the trellis without crowding. They can be kept at a night temperature of 65° to 70°, with a rise of 10° by day. *Joshua Atkins, Lockinge Gardens, Wiltshire.*

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, April 25	Royal Horticultural Society: Meeting of Fruit and Floral Committee, at 11 A.M.; Scientific Committee, at 1 P.M.
WEDNESDAY, April 26	National Aircults Society's Southern Show.
THURSDAY, April 27	Royal Botanic Society's Second Spring Show. Sale of Imported Orchids, at Stevens' Rooms.

IN a previous number (p. 468) we adverted to the report of M. BOPPE on forest management in Scotland and South Britain, forwarded to us from the India Office, and to the recommendations of that gentleman as to the establishment of one or more Forest Schools in this country. We may now in continuance of our remarks pass in review what M. BOPPE has to say about Windsor Forest, in which it may be remembered actual profit is not so much considered as landscape effect and arboreal beauty. Those of our readers not familiar with this noble demense we may refer to our Windsor Supplement, published in October, 1874, and copiously illustrated. The materials for this supplement were got together from several visits paid for the purpose by ourselves and our artist, in company with the late surveyor, Mr. MENZIES, and Mr. JONES, HER MAJESTY'S gardener at Frogmore. "Windsor Park," says M. BOPPE, "is one of the most magnificent fields for the study of forest botany that even the wildest imagination could conjure up. Here may be seen growing singly or collectively in clumps specimens of all the finest trees, native or exotic, which exist in Great Britain; and since care has been taken to keep an exact record of the age and origin of each plantation the forester would be enabled to follow out in detail studies of the highest interest and importance regarding the growth of the principal forest species."

With reference to the New Forest M. BOPPE remarks on the barrenness and poverty of the soil, "which has sufficed to preserve it from being plundered even at an epoch when land was valued more for its extent than its fertility. . . . For many centuries, however, the New Forest has been a prey to commoners who use up its resources without either method or control. . . . The sole remedy for this state of things was to restrict the commoners to certain defined localities, and that could only be done by sacrificing a portion of the forest to save the rest. The part which has been freed is sufficiently extensive to constitute some day a respectable forest, while the part given up is hurrying to its destruction in a manner deplorable to behold, and before very long there will be nothing left but a worthless barren heath. . . . Without contesting the marvellous beauty of some parts of the New Forest, so dear to artists and lovers of Nature, we are bound to say that before long it will not be here that a professor of sylviculture, desirous of teaching his science, will choose to pitch his tent."

As to the Forest of Dean, "In less than a century more than 16,000 acres of the original 20,000 have been replanted. The older plantations are generally of pure Oak; the Beeches, Chestnuts, and Birches form but a small percentage of the trees. . . . The state of vegetation is generally good, varying however with the quality of the soil, but indicating in every point the artificial nature of the forest. . . . A plantation of broad-leaved trees takes a much longer time to establish itself than one of needle-leaved trees—Conifers; . . . the cause of this is that Oaks furnish the soil with much less vegetable manure than coniferous trees, and again, in an Oak plantation there is a marked absence of under-shrubs and spontaneous ground vegetation, which, by their organic remains, tend to increase and improve the surface soil. It is rare also that a plantation of Oaks on a soil which has been long unoccupied by forest vegetation, and is but moderate in quality, succeeds well during

the first generation; it is only at the second generation that the trees acquire their normal development. At present, while the trees are yet in their youth, the only cultural operations that can be undertaken are the periodical thinnings, and these are here conducted with great skill. There is no doubt, however, a great future in store for the Forest of Dean, thanks to the workmanlike manner in which it is managed, and to the laws regulating the pasturage, which date back to the time of Charles I."

The establishment of a Forest School is advocated on these grounds:—For the purpose of replanting the 5,000,000 or 6,000,000 acres of moor and waste land in the Highlands—the depressed state of agriculture, which demands the maximum production from a minimum area—the enormous extent (hundreds of millions of acres) of forest land in India and the British colonies, estimated to be collectively 340,000,000 acres. All these natural resources of wealth are worked by British enterprise and British capital, and consequent on the present wonderful development of commerce throughout the globe, it is a matter of importance to every civilised nation that this vast accumulation of forest riches should not fall into the hands of ignorant persons, or be squandered away regardless of the future. For these reasons the establishment of a Forest School in England becomes a matter of primary importance."

After some remarks upon the absolute necessity of the connection of a scientifically managed forest, with a school for theoretic instruction, the author goes on, as we have said, to recommend the founding of two Professorships of forest economy, one at Cooper's Hill, near Windsor, the other in Edinburgh. As to the Professors, "they should be selected from the young men who have been trained at the Continental Forest Schools, and who have had eight or ten years' practical experience in India. The course of instruction should comprise all the essential parts of the education of a forester, and it would only be necessary to supplement it by sending the selected students for one year to a Continental school, where they would have the opportunity of perfecting themselves in the practical details of forest culture. After this it would be advisable for them, accompanied by their English Professor, to complete their training by making a tour of inspection in some of the mountain forests of France, Germany, and Austria. So prepared the young men would be perfectly capable of undertaking forest work in any portion of the Indian Empire." These are the conclusions, which are substantially the same as we have advocated repeatedly in these columns; and we trust that the time is now not far distant when they will be carried into effect.

— HOUSE ACCOMMODATION FOR GARDENERS AT LAMBTON.—If, during the present generation there had been such general improvement in the habitations in which gardeners and their assistants are housed as there has been in the structures in which are grown the plants they cultivate, many of the craft would be better off in this respect than they at present are. This of course refers to the matter generally, not exceptionally, for, to the credit of many who own large gardens, there has been a marked improvement in recent times, not alone in gardeners' houses, but, also in the places where the young men are lodged. Amongst such there are few places where more thoughtful consideration has been given to the wants and comforts of all engaged in and about the garden, than there has been at Lambton Castle, as will be seen from the views we here give of Mr. HUNTER'S house (fig. 83), and also that in which the young men live (fig. 82, p. 529); both are really handsome buildings, possessing every convenience, with plenty of room in them. In the young men's house, which was spoken

of in the notice of Lambton that appeared in the *Gardeners' Chronicle*, p. 401, n.s., vol. vii., there is a dining-room, reading-room, and bath-room, and a separate bed-room for each man. Neither are the garden labourers forgotten in the matter of their dwellings. Within five minutes' walk of the garden there are half-a-dozen pretty commodious cottages that have not only an air of comfort about them, but their external appearance is such as to induce the occupants to take a pride in keeping them nice.

— BEACONSFIELD BUTTONGHOLES.—"Out of the Hurly-Burly," writing to the *Times* of April 14, says:—"It is an interesting fact worth noting that during the last day or two a demand has arisen in every part of the West-end for what are called 'Beaconsfield buttonholes'—that is, small bunches of Primroses, for wearing on the anniversary of Lord BEACONSFIELD'S death on the 10th inst. [and which, in fact, were largely worn on the occasion]. It will be remembered that the Primrose was his favourite flower. It has always been a popular practice, as classical mythology, church history, and heraldry prove, to associate great names with particular flowers, and it is still in full force, the Emperor WILLIAM being associated all over Germany with his Imperial Majesty's favourite flower, the 'Prussian Blue' *Eleonette* (*Centaurea cyanus*). The greatest savants and naturalists have been prone to have flowers named after themselves, and thus the *Linnaea borealis* was named by GROENOVIIUS in honour of LINNÆUS. They have even condescended to spite each other by the abuse of this practice, as when LINNÆUS named the *Buffonia tenifolia* in unworthy derision of his great contemporary BUFFON'S slender title to fame as a botanist; and JACQUIN still more unjustly called the *Hillia parasitica* after Sir JOHN HILL, in sympathy with his defamation by English scientific men for writing against the Royal Society after rejecting him (Sir JOHN HILL) as a Fellow." "Out of the Hurly-Burly" is, however, scarcely correct in his facts, and had he been aware of the existence in the *Journal of the Linnean Society* (Botany), 1858, of the letters of M. FIE and of the late J. J. DENNETT he would not have perpetuated the error. The writer in the *Times*, following no less an exemplar than Sir JAMES SMITH, considers the epithet *tenifolia* was given in disparagement of BUFFON'S claims as a naturalist. Most botanists would know that such an epithet was given for very different reasons, and LINNÆUS did but adopt a previous name, as the synonymy of the plant shows. Moreover, this was not the real charge brought against LINNÆUS. He was accused of having purposely misspelt the generic name *Buffonia*, by omitting one *f*, so as to suggest an offensive comparison with a toad, *bufo*. Investigation of the evidence, which we need not here bring forward, and of the dates of publication, show that LINNÆUS was not really the author of the name in question, but SAUVAGES, and that the omission of the one *f*, not by LINNÆUS, but by SAUVAGES himself, was a pure oversight; nevertheless, it is true that LINNÆUS did not correct the mistake, but the insult which it was supposed this childish name-calling was intended to avenge was, it seems, not committed till two years after the name was misspelt. It is clear, then, that the genus was named in compliment to BUFFON, the director of the Botanic Garden at Paris, that the misspelling of the name was an accidental occurrence, and that the epithet *tenifolia* was adopted by LINNÆUS not only because it was very appropriate to the plant, but also because it had been attributed to it long before BUFFON'S time, as by RAY and FLETCHER. As these authors are actually cited by Sir JAMES SMITH, in the synonymy of this plant, it was a singular oversight on his part to make the charge which "Out of the Hurly-Burly" has once more set in circulation. FIE points out that LINNÆUS named *Siegesbeckia*, a most beautiful Composite, in honour of one of his furious antagonists, and Adansonia, one of the largest trees and finest flowers, in honour of ADANSON, also in some sort a rival.

— ASARUM VIRGINICUM.—This is an interesting if not particularly showy plant. It is, however, a much more handsome species than our native *Asara* baccata, *Asarum europæum*; it has shining glabrous heart-shaped leaves and inflated bell-shaped calyx-tube of a lurid purple colour spotted with whitish. *A. canadense*, the wild Ginger, Indian Ginger, Canada Snake-root or Coltsfoot of the United States *Pharma-*

macrochaeta, is a softly pubescent species, with kidney-shaped leaves double the size of those of *A. virginicum*. Both species are now in flower at Kew.

— **POTASH FOR POTATOS.**—Some recent experiments carried out by the County of Cork Agricultural Society, with much circumstantiality of detail, and with due reference to unmanured plots, show that of several manures employed kainit (sulphate of potash) was most efficient. It was applied at the rate of 2 cwt. per acre, and yielded a crop of 13 tons 0 cwt. per acre, a gain of 9 tons over the crop on the unmanured plot. Double the quantity of kainit per acre by no means doubled the result; indeed, only about 1 ton more produce was supplied than with half the quantity of the fertiliser. Two

S. Camposii, *S. canaliculata*, *Meum nevadense*, *Seseli granatense*, *S. nanum*, *Primula vulgaris* var. *balearica*, a variety with white flowers closely resembling, according to the figure, some of the forms in cultivation, but less "sophisticated" as to the form of the flower. *Linaria oligantha* and *L. faucicola* are yellow and purple flowered species respectively, and of weedy habit. *Smilax aspera* var. *balearica* is remarkable for its close set branches, which do not trail or climb like those of the type. *Narcissus jonquilloides* is a curious species, with flowers in umbels, each with a long narrow tube, a yellow spreading short-lobed limb, and a deep orange cup.

— **CLEMATIS INDIVISA.**—The growing demand for cut flowers in private establishments—rather

when flowers are held in high esteem, a healthy plant will supply them by the thousand, and what a boon it is to be able to cut a basket of white flowers without the interminable lopping off from pot plants, many of which are perforce cut into mere scarecrows. A plant or so given a favourable root-run travels rapidly, and no better time could be selected for planting than during the present month.

— **EARLY FLOWERING CHRYSANTHEMUMS.**—The value of these, in consequence of blooming so early in the summer, is being increasingly shown year after year. A batch of dwarf-growing Chrysanthemums that can be had in flower in July and August cannot but be an acquisition to gardeners. The best of the select number of early flowering varieties are:—*Aureole*

FIG. 83.—THE GARDENER'S COTTAGE AT LAMFON CASTLE. (SEE PP. 520, 533.)

hundredweight of kainit gave a heavier yield than 30 tons of good ordinary farmyard dung. The variety of Potato experimented on was the Champion; it does not follow that the results with other varieties would be the same in degree, though they probably would be the same in kind. Kainit has the advantage of being cheap, and would form a good manure for Vine borders.

— **THE SPANISH FLORA.**—The fourth part of Professor WILLKOMM'S *Illustrationes Florae Hispaniae*, consisting of coloured plates of rare and interesting Spanish and Balearic plants, has lately been issued. The text is in Latin, French, and Spanish. The figures are of their customary excellence, faithful and instructive, without exaggeration or artistic distortion. The plants represented are *Microcenerum fastigiatum*, *Gerista micrantha*, various *Saxifragas* allied to *S. triclactylites*,

increasing than diminishing—cannot fail to impress the reflecting mind that provision must be made for the future. A gardener must be a man of observation if he is to be successful, and if he can anticipate the exigencies of the future before the shoe pinches too severely, so much the better for himself and for the well-being of his charge. Where a basket of cut flowers, twice a week, was at one time thought sufficient, at least double the quantity is required now; and, by the way, church decoration at Easter-tide is gradually growing into something like a flower carnival. To meet such a demand the roofs of all cool structures, especially large conservatories and other houses that want ornamenting bad enough, should be covered with creepers that are useful for cutting as well as for looking at. The *Clematis* above named is a plant worthy of extended cultivation for the purposes mentioned. During the spring months,

rosy-crimson, the centre petals tipped with lemon, large flowered; *La Petite Marie*, medium-sized white flowers, borne in large clusters on dwarf sturdy plants, not exceeding 9 to 12 inches altogether, commencing to flower in July and continuing till October—one of the dwarfest varieties grown; *Lucinda*, white; *Madame C. Desgrange*, creamy-white, flowering like a Japanese variety; *Nanum*, bluish-white, very free; *Scarlet Gem*, brilliant chestnut-red, very free and showy; and *Souvenir d'un Ami*, snow-white, a very pleasing and useful variety.

— **THE ROCKWORK IN THE YORK NURSERIES** is well furnished with plants in flower at the present time. *Primula rosea* in large masses forms a striking object at a little distance; there are also many of the other species and varieties of *Primula* in flower. *Soldanellas* of several species are flowering on the

ledges of the rocks in shallow soil. *Omphalodes verna*, with its nice deep blue Forget-me-Not-like flowers, forms masses of bloom very quickly when planted in good soil and partially shaded. A very beautiful plant, too, was the *Polygala chamaebuxus purpurea*; it was densely covered with its reddish-purple and yellow flowers, which are sweetly scented.

— THE FLORA OF AFGHANISTAN.—The recently issued part of the *Journal of the Linnean Society* contains the continuation of Surgeon-Major AITCHISON'S valuable report on the flora of the Kuram Valley. Some of the more interesting features of this communication have already been alluded to in these columns. A Palm, *Nannorhops Ritchiana*, is remarkable for its branching stem, a condition attributed to arrest of growth of the large inflorescence. This Palm, it appears, attains a lofty stature in this region near Thal, lat. 33° N., on the high ground where the winters are very rigorous. In the same neighbourhood the common Box was met with in some quantities. The leaves of the Palm above-mentioned are in some places used as ladles for drinking purposes, one being pulled off as occasion serves, but in other places bows made of the bark of the Apricot, or of the Walnut, lay floating on the pools for general use. In the Malana and Zéran valleys, at a height of from 7000—10,000 feet, the Walnut grows wild, the fruit being quite different in shape from that of the cultivated tree, besides possessing an extremely thick shell, with little or no kernel. The natives, moreover, call it by a vernacular name, while the cultivated Walnut is known by its customary Persian appellation. The Walnut grows in the warm nooks and outer valleys. *Aitchisonia rosea*, a new *Rubiaceae* genus described by Mr. HEMSLEY, who assisted Dr. AITCHISON in the determination of his specimens, is interesting as connecting the stellate-leaved series with two-lobed fruit, and the *Cinchonaceae* with their opposite leaves and interpetiolar stipules. It is described as a low shrub, growing in clumps, with terminal clusters of lovely rose-pink, rather fugacious flowers, which the figure shows to be like those of a *Bouvardia*. The beauty of this shrub is such that it is said it would prove a good acquisition to the floriculturist. Its leaves when bruised are, however, stated to be very fetid. *Nepeta piniatorum*, a very showy plant, with large bright lavender coloured flowers, has been introduced and flowered at Kew in June, 1881, from seed collected in 1879. Thirty lithographic illustrations of plants accompany this interesting memoir. Among the plants figured are the *Rosa Eca* and other species, to which we have from time to time referred. Among *Rhododendrons* two new species are figured—*R. Colletianum*, with close heads of *Daphne*-like regular pale rose flowers, with included stamens, and *R. afghanicum*, with conical heads of slightly irregular greenish flowers, with long protruding stamens. This latter species is said to be poisonous.

— THE CARRIAGE OF GARDEN PRODUCE.—At Penzance on the 13th inst. Mr. C. C. ROSS, M.P., presided over a large number of market gardeners and others interested in the transit of garden produce to the North of England to hear from Mr. STEVENS, of the firm of MARSHALL, STEVENS & CO., of Liverpool, details of his proposal of carriage by steamers from Penzance to Garston Dock and thence, *viz.* London and North-Western Railway, to all markets north of Birmingham. Mr. STEVENS stated that he was prepared to run three or four steamers a week from Penzance to Garston during the season, the rates to be not more than Jersey, and at least 10s. a ton less than the railways at present charge. A resolution pledging support to the scheme was unanimously carried. In proposing a vote of thanks to the Mayor for presiding Sir JOHN ST. AUBYN, M.P., said the railway interest in the House of Commons had increased and was increasing and ought to be diminished. Those who had experience of railways knew that unless there was opposition they would never reduce their rates or give the public accommodation. The market gardeners were perfectly justified in the action they had taken.

— AUSTRALIAN GRAPES.—The General Horticultural Company (JOHN WILKS), Limited, last week received an experimental consignment of Grapes from Sydney, New South Wales, but which unfortunately proved a failure. Five different methods of packing were adopted, but in every case the samples were rotten or rotting, and quite worthless. Their condi-

tion at starting must have been fairly good, though they were small in bunch and berry, but had they arrived sound would probably not have met with a ready sale.

— CYDONIA JAPONICA AS PYRAMIDS.—Some plants of this fine hardy flowering shrub are just now a striking feature in an old-fashioned garden attached to a farmhouse in East Kent. The trees were planted some twenty years ago, and have been pruned back yearly in a rough and ready fashion; but each year they bloom with surprising freedom, and maintain their floral mantle of bright crimson for a considerable time. Standing in a line with some old espalier fruit trees, they contrast both with the form of the apple trees and the colour of the flower-buds; and so vivid is the mass of colour in the case of the *Cydonia*, that passers-by stop and wonder what it affords such a remarkable glow of colour. The soil is of a stiff sandy loam, which, by the way, does not nearly so well suit the espalier Apple as it does its gorgeous neighbour.

— ESSEX FIELD CLUB.—The twenty-seventh ordinary meeting of this Club will be held at 3, St. John's Terrace, Buckhurst Hill, Essex, on Saturday evening, April 29, at 7 o'clock. The following papers are promised:—1. "Primeval Man in the Valley of the Lea, with an Exhibition of his Weapons and Tools;" by WORTHINGTON G. SMITH, F.L.S., F.R.H.S., M.A.I., &c. 2. "The Lepidoptera of the District Around Maldon, Essex; a Contribution to the Insect Fauna of the County;" by GILBERT H. RAYNOR, M.A., Vice-President of the Cambridge Entomological Society.

— AN OLD-FASHIONED FLOWER GARDEN.—When any one is interested in plants, and especially in those which bloom in the spring, it is difficult to resist the impression that an old-fashioned flower garden has very frequently elements of interest that cannot be found in gardens modelled and planted after a more modern style. Take, for instance, a flower garden attached to an ancient farmhouse near the sea-coast in East Kent. It must be at least two generations since this garden was planted, and with the exception of an annual digging and top-dressing, and the addition of a few subjects from time to time, the majority of the plants have remained undisturbed since that period. Here are patches of single blue and double red *Hepaticas* that have grown into enormous proportions, and which bloom with amazing freedom year after year; and not only are the flowers numerous, but of large size and finely coloured. In the moist sandy loam the roots go down to a great depth. Near these are clumps of double lilac and double white *Primroses*, of equal size and age, that produce flowers of such uncommon size as to look quite unlike what is seen in ordinary gardens. The beautiful vernal *Omphalodes verna* can be seen in patches a yard in diameter, the Forget-me-not-like blossoms large and of a beautiful clear hue of blue. Common *Primroses* throw flowers of enormous size, though not superior in size to those found in the luxuriant hedgerows that flank the Kentish lanes. Christmas Roses, varieties of *Crocus* versus with a gross growth of foliage; purple and white *Honesty*, Crown Imperials in clumps that have been undisturbed for years, Snowdrops, double *Daffodils*, the double white and Poet's *Narcissus*, *Anemone fulgens*, and *Mysotis dissitiflora*, both of comparatively recent introduction to this part, but thoroughly established; *M. sylvatica*, in large masses; the single scarlet *Anemone*, varieties of early and late Dutch Tulips, that grow to amazing size in this congenial southern home, with patches of *T. Gesneriana* that will be shortly masses of regal beauty; the English and Spanish Iris, *Paeonies*, clumps of white Lilies that produce some thirty to fifty flower stems; Solomon's Seal, Lilies of the Valley, &c., with Sweet Williams, Phloxes, Michaelmas Daisies, Pyrethrums, Canterbury Bells, and others too numerous to mention, bringing up the rear. There is no order in the distribution of these subjects, and they have so much outgrown the space originally allotted to them that they have become somewhat intermingled, but their luxuriant growth and profusion of bloom command the fullest admiration. Then there are Roses, Clematis, Ribes, Spring, *Daphne*, Berberis, and other flowering shrubs and climbers to furnish their quota of floral service. The garden walks are of soft turf, and the fences are

hedgerows of Yew, Thorn, and Privet. The soil does not crack in the hottest and driest weather; the sub-soil is composed of sand and sandstone, and is always cool and moist. If this garden were re-arranged according to modern notions one-half of its peculiar charms would be gone. Many of the subjects succeed so well because they remain undisturbed, and they are sustained by liberal dressings of manure and leaves laid on in autumn and winter. It is a real delight to spend a few hours in this garden; one notes the subjects with delight, and leaves it with reluctance. May old-fashioned gardens long be spared to us to show us how great a charm they are in spring and early summer.

— RHODODENDRON COUNTESS OF DALKEITH.—The fine new *Rhododendron*, exhibited by Messrs. IRELAND & THOMSON at the late exhibition of the Royal Caledonian Horticultural Society under the erroneous name of *R. Thomsoni*, has been renamed *Countess of Dalkeith*.

— PRIZE FOR ORCHIDS.—We learn from the Hon. and Rev. J. TOWNSEND BOSCAWEN, steward of the Horticultural Department of the Bath and West of England Society, that at the meeting which opens at Cardiff on Whit-Monday a silver cup of the value of ten guineas will be given for the best collection of Orchids.

— THE QUEEN AT MENTONE.—On Wednesday, April 5, the QUEEN visited Dr. HENRY BENNET'S garden at Grimaldi, accompanied by the Princess BEATRICE and her suite. Her MAJESTY walked over a great part of the garden. Her MAJESTY'S attention was riveted by some fine specimens of the *Aracaria excelsa*, which thrives thoroughly in the more sheltered regions of the Mediterranean; and also by some masses of *Opuntia vulgaris*, or Barbary Fig, in full bearing. Several members of the Royal party tried the ripe fruit. The following day, April 6, Dr. HENRY BENNET was formally presented to Her MAJESTY by Sir HENRY PONSONEY, by special command. The QUEEN mentioned her visit the previous day to the Grimaldi garden, expressed great pleasure and delight at the views and flowers, and asked Dr. HENRY BENNET how he had contrived to make so charming and fertile a garden on the mountain side, apparently on an all but barren rock. Dr. BENNET, in reply, explained his success by the fact that there was a very ardent sunshine at Mentone—"Very ardent, indeed," remarked Her MAJESTY. Secondly, there was no winter frost whatever in the garden, so that the plants lived on from year to year. Thirdly, he had managed to secure, in one way or another, an ample supply of water. Fourthly, gardening skill and appliances were called into use. Previous to Her MAJESTY'S departure, Dr. BENNET received from Sir HENRY PONSONEY, by the QUEEN'S command, "in remembrance of Her MAJESTY'S visit to Mentone," a handsome gold medalion seal, bearing the Royal initials, V.R., the Royal motto, and the Rose, Shamrock, and Thistle, elegantly engraved. In his letter Sir HENRY PONSONEY says—"The QUEEN commands me to thank you for all that you have done to render Her MAJESTY'S residence here a pleasant one. The QUEEN has been delighted with the splendid flowers which you have daily sent Her MAJESTY from your beautiful gardens."

— ABUTLON BOULE DE NEIGE.—A remarkable specimen of this well-known variety is now a very attractive sight in Regent Gardens, Dawlish, owned by Mr. MANNING, florist, of that town. The plant is growing in an 8-inch pot, is over 6 feet high, and is literally smothered with flowers. Two hundred flowers were gathered from the same plant less than a week ago. For buttonhole work alone, where trade is brisk, such plants ought to pay for their cultivation.

— THE BANANA IN FRANCE.—According to the *Revue Horticole* the Banana has fruited in the open air at several parts of the Eastern Mediterranean coast of France, particularly at Cannes, in the beautiful garden of M. DOGUIN.

— CAMPANULAS AS POT PLANTS.—Amateurs and others desiring to have a cheap display of flowers in their greenhouses cannot do better than turn their attention to the cultivation of these plants. A large batch of them (double varieties) coming into flower in a cool house in the Devon Rosery, Torquay, shows

clearly what may be accomplished in the way of show by giving attention to the cultivation of inexpensive plants. The plants are grown in three distinct colours, viz., white, blue, and pink, and a charming display is produced by the association of these three colours alone, to say nothing of the additional pleasure that may be derived from a more elaborate arrangement with other plants.

— **BALL DECORATIONS IN GLASGOW.**—The Bachelors' Ball, given in St. Andrew's Hall, Glasgow, on the 14th inst., seems to have been a very successful affair, from a floral point of view, if we may judge from the glowing descriptions of the handiwork of Messrs. J. & R. THYNE given in the local papers. "A greater profusion of plants has not been seen in Glasgow at any similar gathering."

— **SIR HENRY COLE.**—The death of this able and devoted public servant will bring home to the nation with very forcibly the value of the services this truly remarkable man rendered to the cause of progress in art, science, and literature. If not the initiator, at least for many years the chief guiding spirit of undertakings such as the Great Exhibition of 1851 and its successors; the foundation and management of the South Kensington Museum—a wonderful testimony to the ability and perseverance of the man; the establishment of the Science and Art Department, which is doing so much excellent work to promote special education and general welfare; and of very numerous other schemes for the improvement of the people: such a man deserves to be held in the highest honour. It is not the time to call to mind the way in which he sometimes compassed his ends; no one now doubts either their extreme importance, his own disinterestedness, or his wonderful success. His splendid success, indeed, will remain—the memory of his method of work will be forgotten, as it ought to be. Few things, indeed, which he was associated with did not prosper; and an exception may be mentioned in his connection, years ago, with the Royal Horticultural Society—a connection by many supposed to be the beginning of the disasters that have befallen that institution; but whether that be so or not Sir HENRY COLE'S triumphs were so great and so valuable that posterity will not fail to mark him as one of the greatest benefactors to the nation that the century has produced. Sir HENRY was at one time a frequent contributor to literary undertakings, and in past years was an occasional correspondent of this journal. In 1873, after fifty years of varied and untiring work, he retired from the public service; but rest for so active-minded a man was an impossibility. He continued to the last to occupy himself with schemes destined to promote the welfare and comfort of his fellow-citizens, and died, after a short illness, on the 18th inst., in the seventy-fifth year of his age. Doubtless, no time will be lost in taking means adequately to commemorate the work of one of the most distinguished public servants of whom the country could at any period boast.

— **THE WEATHER.**—General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending April 17, issued by the Meteorological Office, London:—The weather has been very dull and unsettled; much rain has fallen in the south and south-west, and heavy snow and rain in the north, while a thunderstorm was experienced in the south-east on the 15th. Temperature has been below the mean in all districts except "England, S." and "England, S.W.," where it was about equal to the average. In Scotland the deficit was as much as 4° to 6°. The maxima were generally registered either on the 11th or 15th, and ranged from 54° in "Scotland, W." to 62° in "England, S." and "England, N.W." The minima were very low for the season, a reading of 25° being reached at Maree Castle on the 10th, and 26° at Durham, Churchstoke, Douglas, and Brookborough, while at many other stations the thermometer fell to between 27° and 31°. Rainfall has been more than the mean in all districts, the excess being considerable in all parts of the kingdom except "Ireland, N." Bright sunshine has been much less prevalent than during last week, the percentages ranging from 30° in "England, S." to only 9° in "England, N.E." Depressions observed:—The distribution of pressure during this period has undergone sudden and considerable alterations, several depressions having advanced over our islands from the westward or south-westward. The wind has consequently been very variable in direction, but was generally between south and east during the earlier part of the period, and between north and north-east (except over Ireland) on the 15th and 16th, while by the 17th it was southerly to westerly over England and Ireland, and southerly to easterly in Scotland. In force it was light to moderate on most days, but on the 13th, 14th, and 15th, a strong breeze or fresh gale was experienced.

DEATH OF CHARLES DARWIN.

THE intelligence of the death of Mr. Charles Darwin, in his 74th year, on the 19th inst., will be received with the greatest concern. To few, comparatively, was it privileged to have personal acquaintance with this remarkable man, as, owing to his always feeble health and retiring disposition, Mr. Darwin, though he became world-famous, yet entered little into public society. He was born at The Mount, Shrewsbury, in 1809, and was the son of Dr. Charles Waring Darwin and a grandson of Dr. Erasmus Darwin, several of whose speculations, as published in the *Botanic Garden*, were, as it were, revived and continued by his grandson. Charles Darwin was educated at the Grammar School at Shrewsbury, whence he proceeded to Edinburgh and afterwards to Cambridge, which has thus the glory of having a Newton and a Darwin among its many illustrious pupils. At Cambridge Darwin became a pupil of the late Professor Henslow, to whom and to Professor Sedgwick he owed much as regards the development of his scientific tendencies. Mr. Darwin, long before he became known to the general public, had achieved renown among his scientific brethren. His services as naturalist on board the *Beagle*, during its five years' voyage round the world, and the results of which were given in his *Journal of Researches into the Geology and Natural History of the Countries Visited*—gave him a place amongst the foremost of rising naturalists, a place which was confirmed by his labours at the Geological Society, and by his numerous papers and works on coral-reefs, the natural history of the cirripeds, &c. It was not, however, till his *Origin of Species* appeared, in 1859, that he became known to the public at large.

That work—a masterpiece of lucid argument and cumulative evidence—has sufficed, in less than a quarter of a century, to revolutionise natural history. At first it was received with suspicion even by many naturalists, and with open hostility by that larger public who, unable to appreciate the line of argument, and unable to estimate the enormous body of facts upon which it was based, made it the subject of the grossest misrepresentations, and looked upon the work as an attack on their cherished prejudices and prepossessions. Gradually, however, as the argument began to be better understood, and the consummate genius with which the facts brought together were marshalled and brought to bear on the theory became recognised, the tide of feeling, especially among naturalists, turned in favour of Mr. Darwin—a circumstance largely aided by the personal character of the author, the perfect candour of his statements, and his resolute avoidance of polemical controversy. The steady support from the first of such men as the late Sir Charles Lyell, of Sir Joseph Hooker, Professor Huxley, Mr. Bentham, and others—the more valuable as it implied the abandonment on their parts of opinions formed and steadfastly acted on for years by men whose caution was known to be equal, to their sagacity—powerfully helped on the new theories or the new development of old ideas, and they were also most materially assisted by the writings of Wallace, whose experience as a naturalist in the tropics had led him to similar and independent conclusions. The two volumes on *The Variation of Animals and Plants under Domestication*, which contain the justification of the now famous theory, form an encyclopædia of facts relating to natural history the value of which, quite apart from any theory, can hardly be too highly estimated. Nowhere else can such a body of facts be found, and, as we have said, the way in which they are disposed, and the perfect fairness with which they are set forth, are such as of themselves stamp the genius of the man. Personal observation and extensive research did not satisfy Mr. Darwin. The most elaborate actual experiment was brought to bear with a sagacity in conception and a patience in carrying out which have never been surpassed, and rarely equalled. These experiments related to the fertilisation of Orchids and of numerous other plants, the movements executed by growing plants, the curious phenomena of digestion carried on by the leaves of certain so-called carnivorous plants, the action of worms on the soil, and other subjects now so well known, that the mere mention will suffice. These manifold researches have raised Darwin to the highest rank among naturalists and experimenters, a rank accorded to him by universal consent, seeing that, not only in this, but throughout the civilised world, Universities and Academies have been proud to enrol him among their members.

We need not now stop to detail the various arguments derived from many sources by which Darwin laid down in these later times the doctrine of evolution. In principle, if not in detail, it is now almost universally accepted; and what was received with hostility and ridicule has now become so generally accepted as true that the terms evolution, inheritance, variation, the battle of life, survival of the fittest, have become household words, and are applied to circumstances and conditions never dreamt of by Darwin himself. The origin of living beings from a common stock, their divergence according to circumstances, the force of competition in moulding their forms and other circumstances, upon which the theory of evolution is founded, are now accepted, in principle if not in every detail, by almost all naturalists; and the proof of their underlying truth is shown in the vast advances that have been made in every department of natural history consequent upon the application of the theory to the unravelling of the problems of life and organisation. This mighty and varied development never could have arisen from a theory that was intrinsically false. Things before inexplicable fall into their places, heretofore isolated facts cohere into one harmonious whole. Classifications before arbitrary become truly natural. The significance of morphology, the meaning of rudimentary and now useless structures, becomes apparent; the adaptation of the organisms to the work they have to do, the inheritance from generation to generation of particular forms, the variation according to circumstances—all these, instead of being isolated facts—mere curiosities—become welded in one symmetrical theory by which the structure of the universe and its inhabitants, and their relations one to the other, become clear and harmonious to a degree that was hardly conceivable a quarter of a century ago.

As to the bearings on what, for convenience sake, is called the Darwinian theory, we may be allowed to repeat here what we said on a former occasion. We might add greatly in points of detail, but that is not necessary for our present purpose. Writing in 1875 we said:—

Comparatively few among practical horticulturists have duly considered the extent of Darwin's services to horticulture. Succeeding generations will, it may be, apply his principles to their daily work quite unconsciously, but even now physiologists will admit that, since the days of Thomas Andrew Knight, no physiologist has done so much to extend the basis on which successful culture, whether of animals or of plants, depends.

We have, however, much more direct reasons for claiming him as the physiologist who has done the most in our time to advance the science of horticulture. The intelligent reader needs but to read the headings of the chapters in the *Origin of Species* or the *Variations of Animals and Plants*, to find ample justification of our remarks.

Let any one who knows what was the state of botany, in this country at least, even so recently as fifteen or twenty years ago, compare the feeling between botanists and horticulturists at that time with what it is now. What sympathy had the one for the pursuits of the other? The botanist looked down on the varieties, the races, and strains raised with so much pride by the patient skill of the florist as on things unworthy of his notice and study. The horticulturist, on his side, knowing how very imperfectly plants could be studied from the mummified specimens in herbaria, which then constituted in most cases all the material that the botanists of this country considered necessary for the study of plants, naturally looked on the botanist somewhat in the light of a laborious trifler. Both classes carried on their investigations in a narrow spirit of isolation, unconscious or unheeded of the assistance that either might give to the other.

The investigations of Gaertner, of Kulerter, of Sprengel, of Vaucher, had been allowed to remain by British naturalists as so many dead letters. It was a chance if a page or two were devoted to them in textbooks; rarely, if ever, were they mentioned in lectures, still more rarely was their bearing on horticulture alluded to. Darwin, by his renewal and extension of these experiments, and especially by his deductions from them, altered all this. He made the dry bones live; he invested plants and animals with a history, a biography, a genealogy, which at once conferred an interest and a dignity on them. Before, they were as the stuffed skin of a beast in the glass

case of a museum; now they are living beings, each in their degree affected by the same circumstances that affect ourselves, and swayed, *mutatis mutandis*, by like feelings and like passions. If he had done nothing more than this we might still have claimed Darwin as a horticulturist; but, as we shall see, he has more direct claims on our gratitude.

The apparently trifling variations, the variations which it was once the fashion for botanists to overlook, have become, as it were, the keystone of a great theory. The variations which the florist saw, seized on, perpetuated, "improved," furnished the suggestion for the theory of "natural selection." It is quite unnecessary to go into explanations now-a-days on this point: suffice it to say that an apparently trifling variation may be (it has not been proved absolutely that it is), may be—probably is—the first stage in what will, under favourable circumstances, eventually develop into what we call a species. From this point of view a new variety raised by man, as Darwin himself says, is a more interesting subject for study than one more species added to the crowded lists. Darwin borrowed the idea of "natural selection," or, as it is more accurately termed, "the survival of the fittest," from the gardener. The gardener or the florist selects, causes to survive, and propagates varieties showing one particular quality or tendency which he may happen to desire; but in Nature the selection or the survival is not so simple an affair. If it were a mere question of strength, "the weakest would always go to the wall;" if of speed only, the hare must outrun the tortoise; but we all know how diverse and complicated are the conditions under which living beings, plants as well as animals, exist, and we admit with Solomon that "the race is not always to the swift, nor the battle to the strong, but time and chance happeneth to them all." We may safely interpret the word "chance" here as the equivalent to our "circumstances."

Passing from this question of selection, in which, if Darwin has taken much from the practical man, he has repaid him with abundant interest, we may allude to one of the great elements in the consideration of the aforesaid circumstances, viz., the "interdependence of living organisms." We all know and admit this principle to some extent, but it is probable that few of us realise how greatly and of necessity one organism is dependent upon another. Almost every gardening book we take up has a chapter or a paragraph on the insects injurious to this or that crop, but we do not find, at present, in our theories of horticulture and books of the garden, any but the slightest reference to the insects that are beneficial to the plants we cultivate. We ought to have learnt something about this from Sprengel, from Gaertner, and others. Herbert did learn and did teach somewhat of this, but his lessons never took much effect. Surely the laborious researches of, and the important practical results obtained by, Darwin will open our eyes to this matter, and fix our attention a little more closely and fixedly on what is of such vital consequence to us. We must remember this is no visionary theory; if anybody wants facts let them study the record of Darwin's labour and Darwin's patience in the *Journal of the Linnean Society* and in our own columns, to which Mr. Darwin has contributed from the first. These labours and these facts establish beyond controversy the manifold and intricate way in which living beings are tied together, and the extreme complexity of the conditions under which living beings have to maintain their struggle for existence.

Space would fail us if we attempted to give further illustrations of this: it must suffice to mention the great subjects of fertilisation by insects, of cross-fertilisation, of hybridisation, of dimorphism, on all of which Darwin has experimented patiently and written lucidly. While the florists have for years been selecting their pin-eyed and thrum-eyed varieties of Auricula, selecting the one and rejecting the other, it seems never to have occurred to them to inquire what was the meaning of the difference. Here was a difference brought prominently under their notice, they regulated their course accordingly, they acted from motives of mere fancy or fashion, without troubling themselves any further about the matter. "Why should we do this?" they might well have asked, in pre-Darwinian days. "Of what good would it be to us? We know what we want and how to secure it—why concern ourselves further?" And the pre-Darwinian botanist, if he considered the

matter of any interest at all, would have been unable to answer these questions. How altered is the state of things now! Thanks to the laborious experiments of Darwin—thanks to the example he has set, the purpose of this, as of many other curious points of structure, passed over before as merely curious, has been made apparent. No more persuasive apostle of natural history, indeed no more powerful advocate of the argument furnished by design and adaptation, ever lived than Charles Darwin.

We cannot now go into further details of physiology, important as they are. If the florists now ask the botanist the meaning of the pin-eyed and thrum-eyed flowers and other similar variations they will learn something very much to their advantage. They require improved varieties, fixity of form, abundance of seed, and robust constitution in the seedlings. Let them study the chapters on cross-fertilisation and dimorphism which Darwin has written, and they will see how they may attain their ends. So with such cases as "bad setters" among Vines or Cucumbers, such things as blind Strawberries, the great physiologist of our day has supplied the thoughtful cultivator with innumerable facts, careful observations, and suggestive inferences. It is impossible for us to do more than indicate these matters, nor can we do more than allude to the many other subjects elucidated by the genius of Darwin, and which have, or may have, a direct practical bearing on the pursuits of the gardener and agriculturist.

Enough for us now if we have shown that to Charles Darwin, setting aside, as beside the question we are at present concerned with, all direct reference

FIG. 54.—BIRTHPLACE OF CHARLES DARWIN, SHREWSBURY.

to his theories as to the origin and progress of species, are due grateful homage and reverence from every thoughtful horticulturist of the present, from every careful practitioner of the future.

At the meeting of the Linnean Society on Thursday evening, the President, Sir John Lubbock, alluded in fitting terms to the loss which the Society and natural history in general had suffered by the death of Mr. Darwin. He alluded to the fact that the latest of Mr. Darwin's papers, on the action of ammonia on roots, was read quite recently before the Society, as reported in these columns. Mention was also made of the excellent portrait of the great naturalist by Mr. Collier, recently presented to the Society, and after a feeling tribute to Mr. Darwin's personal qualities as a friend and neighbour, Sir John proposed the adjournment of the Society as a slight tribute of respect to the memory of one of its most distinguished Fellows.

We learn that preliminary arrangements are being made by the Presidents of the Royal and of the Linnean Societies with a view to the interment of the illustrious biologist in Westminster Abbey, subject to the wishes of the members of the family.

TACCA ARTOCARPIFOLIA.—At New this striking and curious *Monocotyledon* is now in flower. The leaves are about three in number, with petioles about 3 feet or more in length, surmounted by a compound leaf about 2 or 3 feet in diameter. The brown upright scape overtops the foliage, and bears a head of numerous stalked greenish flowers, the sterile ones being reduced to brown pendulous threads some foot or so in length. Although the species now under notice can boast of no gaudy colours, the elegance of its leafage and its strange inflorescence make it well worth growing in any choice collection of stove plants. A native of Madagascar and Johanna Islands.

HOME CORRESPONDENCE.

African Tuberoses.—Recent correspondents upon the subject of the culture of these bulbs have taken rather diverse views as to the cause of their failure in producing blooms in our midwinter months. Whether this is due to the short supply of daylight at that time of year, as held by many, or because large bulbs make but few roots, as assumed by "J. McK." (p. 474) it is very desirable should be, if possible, determined. For ourselves we should be disposed to think that a meagre production of roots must be attributed to undue haste in forcing, rather than to any special deficiency in this direction peculiar to large bulbs. Hence an error of cultivation. Should, however, "J. McK.'s" view be correct it will corroborate an opinion we have often expressed, that the desire on the part of growers to always obtain the largest bulbs, irrespective of other qualities, is not supported by knowledge. We have still, it appears, much to learn respecting the treatment of these bulbs, and at this moment we should specially like to be informed how any of your readers may have fared who potted these Africans in the autumn, but checked the development of their flower-stalks until February or March. If such experiments have succeeded they will, at least, form a valuable adjunct to the American or European bulbs, which cannot be brought in so soon. The vigorous and healthy growth of the African Tuberoses leaves nothing to be desired, and the question of its successful culture is one of commercial as well as scientific interest. We are glad therefore to see that it is being publicly discussed.

Hoppe & Co., Covent Garden.

"Failure" appears to be the epitaph that may appropriately be written over the departed African Tuberoses, as neither through the columns of the gardening papers nor from private sources have I heard of success being attained in a single instance although they have been grown by the thousand. In contrast with these accounts of cash and labour lost, of withered hopes and blighted expectations, it will be highly interesting to the gardening fraternity to learn that I had them in bloom since March 20, notwithstanding I can only count by the dozen instead of the thousand. For reasons which I need not explain, I wished to bloom a portion of them by the end of January or beginning of February. These failed. The remainder I did not require until the end of March and during April. These have succeeded. I judge from this either that they do not possess sufficient constitutional stamina to stand the forcing necessary to bloom them at the earliest period named, or that the length of day is too short between November and February to ensure success. This is a question that may be determined ultimately by the aid of the electric light. Meanwhile, however, it will be seen that there is a possibility of blooming them, and that they may be in the market in quantity by Easter. They throw up a flower-stalk about 4 feet in height, with from twelve to twenty blossoms at the top, and are very strongly perfumed, one spike being as much as any lady or gentleman would care to have in the drawing-room. *H. C. Wilson.*

Tulipa sylvestris.—I am much obliged for your reply about the *Tulipa sylvestris*. The orchard in which it grows was formerly used as gardens attached to some small houses, and the ground now occupied by the bulbs (in five distinct patches) represents part of at least four different gardens as they were some fifty years ago. Can these *Tulipa sylvestris* have been cultivated originally in these gardens? I observe that in last week's *Gardeners' Chronicle* Mr. Horsfield also sent an account of the same plant, and growing not 15 miles from this place in the Wylie Valley. I think perhaps that the reason why *Tulipa* so few blooms may be owing to the grass being cut early in the season, before the foliage and bulbs have had time to ripen. In fact, one patch has already been so treated this spring, before I knew what mischief was being done. If the bulbs were lifted later in the season, and planted in a border, would they be likely to do better, and bloom more freely? And, if so, ought I to select a sunny or shady spot? [The former. Ed.] *H. M. Holloworth, Wilton, Salisbury.*

Galeandra nivalis.—This beautiful and rare Orchid was shown at the meeting of the Royal Horticultural Society on March 18, by Sir Trevor Lawrence. The *Galeandras* are tropical American Orchids, with slender erect fleshy jointed stems, the joints slender and glaucous; the two-ranked sheathing leaves are narrow lanceolate. From the apex of the stem proceeds a nodding raceme of flowers, each about 2 inches in length with narrow reflexed light olive-coloured segments with a large funnel-shaped white lip, marked with a central violet blotch. It is a species demanded

ing a high temperature and abundance of moisture during the growing season. *M.*

Planting-out Forced Bulbs.—If one quarter of the bulbs that are annually purchased for forcing were only planted out instead of being consigned to the rubbish-heap, gardens all over the country would be greatly enriched and beautified during spring, as bulbs are not among the things that perish after a year's growth, for the majority of them are hardy, and if placed under anything like favourable conditions they increase and multiply at such a rate that tufts of them soon become large and imposing. Where the greater part of them look most at home is under or immediately around deciduous trees or in the foreground of shrubs among grass, and by leaving the latter uncut or trimmed it forms a natural green carpet, that sets them off to advantage. In beds and borders bulbous plants have a hard time of it, as under the present system of embellishment they are either dug up and laid in some out-of-the-way place, or

soon able to root out beyond and establish themselves, Primulas and other perennials of like nature may be lifted with large sods of earth and dropped in like manner, when with a good watering they will take to their new quarters at once. By starting now with the planting, a good effect may be produced next year, which will be heightened as each season comes round. *F. S.*

Arisæma speciosum.—I know nothing more curious than the way in which this plant appears aboveground. The large leaf is divided into three segments, each 8 to 10 inches long, which are separately rolled up in the bud, the two lateral ones pointing downwards. The middle one, which points up, first escapes from the large bract which envelopes the whole, and it is then perceived that the extraordinary thread-like appendage which terminates the spadix is carried up in the leaf quite apart from the flower, which is not then aboveground. This thread measures from 18 to 20 inches long, and is dropped from the

certainly news to learn that they were offered in commerce in this country prior to the present season. I may say, that if offered through a list from an American house, the committee of the International Potato Exhibition do not recognise such publication as offered in commerce in this country, because such offer must be necessarily limited, and would not reach the general public. All sorts to be regarded as in commerce here, must have been offered through some home house. After all, am I fighting a shadow? and does "W. K." confound the autumn or winter of 1881, with the season of 1882, as understood in the trade, which includes autumn, winter, and spring, of 1881-1882. *A. D.*

Fuchsia splendens.—In reply to "S." I can, from experience, say that this Fuchsia always flowers well with me. I grow it in a compost of three parts fibrous loam, the rest leaf-soil, with a little silver-sand well mixed together, and water with weak liquid cow-manure. I start them in gentle bottom-heat, and

FIG. 85.—GALEANDRA NIVALIS. (SEE P. 536.)

have the tops hurried off long before they are ripe, the result of which is that they dwindle and die. Planted in the positions named, they can have their own time to swell and mature their roots, and by remaining undisturbed they gradually gain in strength and flower with the greatest of freedom. Instead of the long grass being an eyesore, it is a positive ornament, especially if left with irregular margins, as may easily be by a few turns of the mowing machine, so as to give bold swells and sweeps to the lines, which will make the shaven part look like a green flowing stream, wending its course through the higher banks of rich verdure with these all aglow with the loveliest mixture of gay coloured blossoms. Among the grass may be planted Daffodils, Hyacinths, Crocus, Snowdrops, Squills, Lilies, Primroses, and many other things as they come to hand or could be spared from the beds or borders, when thinning or re-arranging the same. All that is necessary in the case of bulbs at starting is to dig out with a spade or trowel holes in the soil large enough to admit the ball entire when the plants are turned out of the pots, as by planting them entire they receive no check, and are

middle segment of the leaf as it unrolls. The flower is quite small at first, but rapidly increases in size on escaping from the bract. When first visible the thread is closely wrapped in the point of the spathe. What is the use of this thread no one has yet been able to make out, but there is a curious tendency in some of the terrestrial plants of this family to develop a prolongation either of the spathe or spadix, which I do not remember to have noticed in any of the epiphytal Aroids. *H. J. Elwes.*

New Potatoes.—I should have felt grateful to "W. K." for his corrections of my list of new sorts of Potatoes, which he makes at p. 504, if he had given with them the authorities for his statement. Of Ingleston Flake I know nothing, except that it was quoted in the same list as Cromwell as a new kind by a Northern seed firm. As to Cromwell, I recollect that it was exhibited in the class for seedling white kidneys at the Crystal Palace International Potato Show, in September, 1880, by Mr. Ironsides, as a variety "not in commerce." As to the two American sorts, Queen of the Valley and Adirondack, it is

afterwards grow them in a cool house, and when in flower remove them to the conservatory, shading when the sun is very hot. *T. C.*

Edgings to Walks.—Although Box is generally used as an edging to walks, and answers the purpose very well, it will not compare for beauty and effect with *Gentiana acaulis*, long lines of which are simply superb, the lovely deep blue of the flowers being quite unrivalled by any others, so intense are they in their shading. The finest sight of them I ever saw was at Howwood, where, some thirty years ago, when I had the privilege of serving under the late Mr. Spencer, the walks of a portion of the kitchen garden were bounded in a broad band of this *Gentian*, which in spring, with the upturned blossoms all facing the sun, was truly magnificent. Unfortunately, there are only certain soils in which *Gentiana acaulis* does well, which are those of a somewhat stiff character and rather retentive of moisture. The best way to make durable edgings is to use large flints or pebbles and plant the plants between, as the stones not only form a foundation as it were for the *Gentians* to rest on,

but they are great conservators of moisture, and therefore of manure help to the roots besides which, by raising the surface, they cut off the connection between the gravel and soil, and prevent the one washing on to the other. The proper season to plant *Gentians* is any time now, when the tufts may be divided by pulling them apart, and the plants thereby increased to almost any extent. All that is necessary to get them to grow is to dibble them in carefully, and after that is done, a watering should be given to settle the earth about them, and if the sun happens to be hot and the air very dry, a little shade afforded by the help of a few Laurel or other evergreen branches stuck along the side of the row, will be of much assistance towards getting them quickly established. Seed of *Gentiana acaulis* may also be had of plants raised therefrom, and if sown at once under glass, the seedlings will soon be large enough for pricking out, and will come in well for planting during the following spring. Next to *Gentians*, Thrift forms the best flowering edging, but to raise it well above the level of the gravel it should be planted between flints or stones in the way referred to above. Where tiles are used, their ugliness and stiffness may be much taken off and hidden by planting Violets or Strawberries close behind, both of which when grown in that position are handy to pick. *J. S.*

Craig-y-nos Castle.—The interesting description and illustrations of this place, given in your last issue, remind me of a pleasant day spent there in good company last autumn. Long previous to that I had a great desire to see the place, but had not time to do so. I had intended *grina donna's* connection with the place had gained it more than a local interest, and the local papers devoted columns to describing the grand natural beauty of the locality for miles around, the number of rooms in the Castle, the colour of all the wall-papers, the kind of wood the furniture in the drawing-room and the kitchen was made of, the size and numbers of all the windows and doors, besides much other information concerning the kind and general way in which Madame intended herself in her garden. Welsh neighbours, however, little or nothing was said about how the grounds around the Castle had been beautified, and how the head and hand of the artistic landscape gardener had converted a rugged mountain side into one of the most enjoyable of gardens. This in my opinion is the best, most interesting, and cleverest part of it, and it may well be considered the crowning part of Mr. Barron's many good works in South Wales. To form terraces, such as those shown in the woodcut, on a bank almost perpendicular is no easy undertaking, but nothing could be more satisfactory or substantial and beauty. The large conservatory or winter garden is an elegant and well constructed structure, and both outside and in is quite in character with the Castle and all its surroundings, and is more than can always be said to be the case. The heating, too, is done after Mr. Barron's own ideas, the boiler being one of his own devising, and it is fixed down a little ravine many feet below its work, but this is no hindrance to the contrary, it acts admirably, heating several thousand feet of piping with the greatest rapidity and efficiency, the great rise in the pipes causing the water to rise and flow swiftly to the furthest ends, which are several hundred yards from the stockhole. Fruit-houses, plant-houses, and all belonging to this department are on the most improved principles, many new ideas being introduced here with the best result. The kitchen garden is not yet finished, but it is to be hoped Mr. Barron may shortly be able to complete this, as a cucumber net is to be better hands. It is to be stated that this place is easily reached from Swansea by rail, being some 20 miles distant at an elevation of 700 feet. In traversing this distance an excellent idea of the wildness of Wales may be formed; but the mountains are rather sterile, and anything like a good plantation is not to be seen, but large strips and patches of copse occur frequently, especially up the sides and near the edges of the glens. Around Craig-y-nos there is hardly half an acre of flat ground to be seen, the mountains being of the most rugged description; the Castle itself is built of whinstone, and the part which has been so well constructed, and is now cultivated as a garden, is a curious and rare introduction to a region previously so devoid of the gardener's art. *J. Muir, Margam Park, Taitach.*

The Dispersion of Primulas.—The dispersion of plants over new areas is an interesting matter, but how it is accomplished is often a puzzle, and why with some of them it is so readily achieved is more than it is equally difficult to explain. I have recently had an opportunity of watching the spreading of Cowslips over newly made pasture. In 1872 I laid down about 32 acres of arable land as permanent pasture. It had been under the plough, with the ordinary rotation of crops, since 1796, before which time it was a common. The shape of the land is an elongated triangle running from east to west, the

acute angle at the east being truncated and bounded by a small old meadow well stocked with Cowslips. There are no Cowslips in other contiguous fields—I need scarcely say that there were none in the 32 acres in 1872. In 1874 I first saw Cowslips in the newly-made pasture; they were close to the old meadow, and small young plants. From that time to the present they have been marching steadily westward, and are now within 70 yards of the further hedge. The progress has been remarkably even, and at about the rate of 50 yards a year. It has been a purely natural seed dispersion; there have been no manurings, hay-carriages in the direction of the spreading, or other field work, to explain what has happened, or interfere with the process. How have these seeds been scattered? They are small, produced near the ground, and are destitute of any provision for aerial flight. *James Salter, Basingstoke, April 15.*

Pear Directeur Alphan.—This Pear was sent out in the autumn of 1880. I had a drawing sent of it, with a statement of its excellent qualities. It is not known in France, but I do not think it will be good for anything but cooking in England. The two fruits exhibited by me at South Kensington were from an orchard-house tree. Two others were gathered from it, and the only object I had in exhibiting them was to show that the fruits were not likely to be any use for dessert purposes. *J. Douglas.*

Sarmienta repens and *Linnaea borealis*.—Having fallen into an error (p. 504), by writing *L. borealis* synonymous with *repens*, permit me to take this the first opportunity of rectifying it by stating that the two plants are quite distinct from each other. When my note was written, I certainly was under a misapprehension, the result of perusing a private letter and of not having a standard work by me at the time for reference. I may further add that a note just to hand from a good authority on wild flowers informs me that *L. borealis* is to be found growing wild in plenty in some parts of Scotland. *J. Horsfield.*

Bougainvillea speciosa.—Doubtless some of your readers will remember that about a year ago I had occasion to ask for information, through the medium of your columns, respecting the successful flowering of the above when grown in pots. It may also be within their recollection that the only information on the point forthcoming at the time was that which was given in a communication by Mr. Summers, of Sandbeck, and that the plant which was the subject of his remarks was planted out, so that the outcome of the writing, in so far as it applied to the principal point (*viz.*, flowering in pots) was simply *nil*. Well, I am pleased to say that our own plant, which is growing in a 12-inch pot, is now one mass of bloom, and in the interest of others, and with a hope that they will derive benefit thereby, I regard it as a duty to detail the *modus operandi* by which this satisfactory state of things has been brought about. Its flowering, either in pots or when planted out, is rather the exception than the rule, and yet, plants imaginable to flower, and I feel confident that if the following directions are carried out to the letter, no one with plants in their possession need fail to flower it annually. Re-pot about the middle of May in a compost containing two parts fibry peat, one part loam, and one part silver-sand, and add thereto a handful of bone-meal together with a few broken potshards and small pieces of charcoal; use plenty of drainage, over which place a layer of moss; reduce the water both top and bottom, cutting back the shoots of the previous year to within an inch of their base; place in a moist temperature of about 60°; syringe three or four times daily, and when the young growths have made a fair start disbud rather freely, leaving only a few of the very strongest shoots, the number, of course, to be regulated according to the size of each plant. Allow them to grow of their own sweet will throughout the summer months, neither pinching them back nor tying them down into fantastic shapes. As the pots become full of roots give copious supplies of water and expose to the full glare of the sun at all times, not forgetting in hot bright weather to ventilate freely. In the autumn, or when signs of completion of growth are apparent, gradually withhold the supply of water, and for about two months in midwinter, or say, from the end of November to the end of January, keep in a cool house with a temperature of about 40° or 45°, during which time little or no water is to be given. In the spring the plants should be encouraged to make a fresh start by giving them 10° more heat. Cut back the points of all the shoots about 6 inches. Stake and tie them down into the required shape, spiral, pyramidal, or balloon, give a good soaking of water by immersing the pots in a tank for three or four hours; afterwards top-dress with rotten manure; the only further attention

needed is to syringe several times daily, and water at the root when necessary, and when the flowers, or bracts rather, make their appearance, water with liquid manure at every alternate watering. I would just remark, in conclusion, that three of the most striking points are the long green well-ripened wood, and complete rest in the winter months. *J. Horsfield.*

A Day in Derbyshire.—On a recent occasion, journeying to Rowleyshire, on the Midland Railway, and proceeding up the dale through Allport and Youlgrave, I visited the pretty little village of Middleton, where is situated Middleton Hall, the seat of T. W. Bateman, Esq. The object of my visit was to see the splendid display of spring flowering bulbs, for which the place has become celebrated. The mansion occupies a fine position overlooking the dale, and standing back from the main road to Gratton and Winstar, surrounded by well laid out and beautifully kept grounds, which Mr. Bateman takes a pride in having planted with the finest trees and shrubs. Though the situation is bleak and exposed, many of the finer varieties of trees and shrubs do exceedingly well. Great improvements have of late years been effected in the shrubberies. Entering the grounds and proceeding along the drive there burst upon me a vista of dazzling colour with gold and silver. The drive is for brilliancy and effect. A large heart-shaped bed in the centre of the lawn is filled with Hyacinths of four colours—crimson, white, dark blue, and light blue mixed. Two large double-armed rectangular beds surround it on three sides, filled with Hyacinths of the same four colours, but in four lines, each line composed of one colour. The uniformity of the height and the skillful blending of the colours give a remarkably fine effect. Each of the two latter beds contains 300 Hyacinths. A few steps further on there are two beds, one on each side of the entrance to the Hall, each containing 150 Hyacinths in lines, of the colours crimson, creamy white, and dark blue, with a margin of *Scilla sibirica*; on the south side of the Hall, opposite the library window, are three half-moon shaped beds, each containing 300 Hyacinths with the colours mingled. On the opposite side of the drive I found ten oval beds linked together and filled with Tulips, 100 in each bed; each bed contains a distinct colour. The beds are to be seen in the distance, each containing 100 double-flowered Tulips. The whole of these are looking very strong, the flowers just beginning to open, and promise a fine display. Along the line of the shrubbery which runs from the drive to the croquet lawn (70 yards in length) three rows of Hyacinths of various colours are planted; the whole effect of the 1200 flowers is grand. The blaze of colour reminds one of the bulb farms of Holland, though in miniature. To me who have often seen Hyacinths in their native country the comparison is not at all to the disadvantage of the culture in the Peak of Derbyshire. A great deal of care without doubt has been bestowed on their cultivation, and it is worth noticing that the beds are covered with cocoanut fibre, which protects the bulbs from the frost. Derbyshire being no exception to the general mildness of the recent winter, the bulbs are on the average four weeks earlier than they have been for the last four or five years. Any one with a love of Hyacinths who lives within reasonable distance would do well to obtain permission to visit the splendid *fontaine blanche*. Permission which would, no doubt, be readily accorded by Mr. Bateman. I cannot close without giving a word of praise to Mr. Cooke, the gardener, as there is strong evidence of care and good management displayed throughout. *K. T.*

Linnaea borealis.—Mr. Horsfield, at p. 504, asks if "any of your readers happens to be in a position to state positively if *L. borealis* is still to be found growing wild, or naturalised in any part of Great Britain?" I am glad to be able to inform him that it is to be found, and likely to maintain its position in the station where I last gathered specimens in June, 1880 (see *Agg. Bot. Ex. Chron.*, 1880, p. 24). There is a large bed, 30 to 40 yards in diameter, in a Scotch Fir wood, at Mellerstain, in Berwickshire. This station has been known for over forty years. It has also been found recently in other woods in Berwickshire; but I have not seen these new stations. Whether "wild or naturalised," it is impossible to say with certainty. I think it is "wild," as there are other plants in the same woods, such as *Goodyera repens* and *Hypnum cristatensis*, and both of which are plentiful in many of the Scotch Fir woods on the Borders, both in Roxburghshire and Berwickshire. *Andrew Brotherton, Kielder.*

The ooo Again.—Can you give me any satisfactory explanation of the following facts? I purchased last year from a well-known seedsman a packet of show *Auricula* seed, and I was rather surprised at the large number of seeds in the packet. They were sown with much care in a 10-inch seed-pan. At the same time I sowed the contents of three pods of my

own, also a show variety. The result was two plants from the packet of bought seed, and over 100 plants from my own seed; in fact, I believe every seed of the latter grew. Thinking, perhaps it would be more correct to say "hoping," that the result as regards the purchased seed was accidental, I made inquiries and found that my case was not at all peculiar; in fact, a relation of the head of the firm from which the seed was purchased lies near me, and I find he had exactly the same result, viz., two plants out of a packet of seed. For my own part, I can only come to one conclusion, which is, that nearly all the seed was killed before being sent out, and that only a few live seeds of the real thing placed in the packet. As to my different result, I have just sown a packet of alpine Auricula seed from Messrs. Veitch, and I believe every seed has germinated. Three years ago I purchased a packet of Primula seed from another noted firm, and as I paid a long price for it, took special care about the sowing. The result was, five seeds germinated. I at the same time sowed seed of my own saving, and certainly 90 per cent. grew. When I complained to a member of the firm personally, I was merely told that I was "lucky to have even five good seeds out of the packet," as with new varieties it is very difficult to save much good seed. Why, I ask, cannot these growers either have the honesty to say at once that they cannot afford to supply a whole packet of genuine seed for the money, or else send out only such seeds as will grow, i.e., neither light nor killed seed. We know how largely the system of mixing killed seed with good Turnip seed exists, and I conclude the same plan is pursued with certain garden and flower seeds, but it can hardly be called "honest trading," and I think it might do good if people were less reticent when they find these highly-advertised packets of seeds so delusive. *Maryin.*

Notices of Books.

On Board a Union Steamer; a Compilation. By Captain S. P. Oliver. (Allen & Co.)

We cannot wish a traveller on a long voyage at a loss for something to do to while away the time a better fate than the possession of this book, which should find a place in the library of every passenger steamship. Though called a compilation—and, indeed, it is a mixture—the compiler has added a great deal from his own extensive experience, and as he is a good observer and always in good spirits the results are agreeable and varied. The accounts of St. Helena contain, amid some amusing *periffage*, some interesting details relating to the astronomer Halley and his work, but the author should have looked into the *Treasury of Botany* where he described Adansonia as an herbaceous plant of the same order as the Asparagus and Onion—perhaps the Canary Island *Draecena* was really intended. Nothing seems to come amiss to Captain Oliver, from catching turtle to catching dew, concerning which latter desirable feat we cite the following extract:—"An idea for securing a supply of fresh water in desolate tropical islands devoid of vegetation, and which scanty or infrequent rainfall is suggested by the broad Banana-like leaves of the *Urania speciosa*, the Traveller's Tree of Madagascar, which upraised on a tall stem are well suited to intercept the rainfall. The notion is to erect on the hill-tops lines of artificial dew-catchers made in metal, and in the resemblance of the plant in question. The dew would be deposited on the broad blades, which are to be arranged at such an angle that the moisture shall trickle down by means of channels and tubes to a reservoir, with which all the dew-catchers are to be connected. In point of fact the notion is that of a number of rain-gauges of such a form as readily to admit of the deposition and collection of dew and rain. There is no doubt that some such contrivance would be useful."

— *The Ocean Passenger's Handbook and Emigrant's Guide for 1882* is the title of a new pamphlet, published by Messrs. Pitt & Scott, Passengers Agents, 44, St. Paul's Churchyard, London, price 6d., or post-free 7d. It is specially written to answer the numerous inquiries of persons intending to settle abroad.

SPIRÆA OULIFOLIA VAR. *LUTEA*.—Where and when did this golden-leaved variety of the well-known *S. opulifolia* originate? At the present time the bright yellow of its swelling leaf buds and the fast unfolding young leaves cause it to be almost as attractive in the mixed shrubbery—at a distance at any rate—as the beautiful and free-flowering *Forsythias*.

Reports of Societies.

Edinburgh Botanical: April 13.—The Society met in S. St. Andrew Square—Professor Isaac Bayley Balfour in the chair. The first paper read was "An Obituary Notice of the late Professor Sir Charles Wyville Thomson," by Emeritus Professor John Hutton Balfour. The notice embodied the main facts of Sir Wyville Thomson's scientific career, and noted the communications which he had made to the Society as President and otherwise. It was stated that his opinions lay in the corals, crinoids, and sponges, on which his opinion was held as of great weight. In acknowledging the thanks of the Society for the notice, Dr. Balfour said that Sir Wyville Thomson was one of his old pupils, and he had taken a deep interest in him, and that the object of the notice was to preserve a record of his connection with the Society.

The President then explained the general bearing of a communication by him to the Society's *Transactions* ("On the Genus *Trichia* in Britain"). There was, he said, in Britain just now, very unsatisfactory knowledge regarding *Trichia*, to which he had devoted special study for some years past, with the view of shortly publishing, along with Dr. Cooke, of Kew, a work on this and the whole group of the *Mixomyces*, to which it belonged. There was great controversy as to whether the *Mixomyces* belonged to the animal or vegetable kingdom, and, certainly, the group had strong affinities to both. But really he did not think it mattered much one way or the other. Of the genus *Trichia*, the distinctive diagnostic characters, generic and specific both, were to be found in the number of the spirals of the elaters and the markings on the spores. The genus might be at once divided into two main groups, according as the elaters were fusiform or cylindrical; and the first of these groups he again divided into two groups, according as the sporangium was stalked or sessile. Of those having a sessile sporangium there was a great number of species very like one another.

Mr. James Coats Crawford, F.G.S., late of Wellington, New Zealand, read a paper "On Fixing Blowing Sand by the means of Planted Grasses." The points on which he had greatest stress were to plant instead of sowing, and to plant deeply.

Mr. John Sadler, curator of the Royal Botanic Garden, sent in a report "On Temperatures at the Garden, and Effects thereof on Vegetation." He reported on the effects of the thermometer at the barometer was at or below the freezing point on seven different occasions. The dates were as follows:—1st, 32° F.; 7th, 30°; 21st, 31°; 22d, 30°; 23d, 29°; 25th, 32°; and 26th, 32°. There were thus during the month only 8° of frost, as compared with 120° in the same month last year. Since April commenced there had been three frosts nights—viz., 8th, 32°; 10th, 27°; and 12th, 29°; or, collectively, 74° of frost. There had come into flower at the end of the garden since last meeting upwards of 140 species of new varieties. During the past four days, owing to the continued dry, cold, and easterly winds, vegetation had been arrested in its growth.

Mr. John Campbell, Ledaig, Argyllshire, sent specimens of plants in flower with him, including, amongst others, *Oxalis muscaria*.

Dr. Cleghorn presented to the museum at the Royal Botanic Garden a specimen of *Cymonomium cocconium*, a rare plant of the *Balanophoreæ*, collected by him in the island of *Gozo* in 1869.

Scottish Horticultural Association: April 4.—The ordinary monthly meeting of this Association was held in the Hall, S. St. Andrew Square, Edinburgh, the President, Mr. Hugh Fraser, in the chair. The President delivered an inaugural address in which he alluded to the several subjects which should constitute the education of future gardeners.

Mr. Alexander McMillan, Broad Meadows, Berwick-on-Tweed, exhibited a fine collection of *Cineraria* flowers, also a fine collection of tree Carnations, which included *Alcagetea*, *Hermione*, *Miss Jolly*, *du*, *Martha Pacha*, *Sir Garnet Wolseley*, and *Alice*. Mr. James Gildowie, Willowbank House, exhibited the flower of *Wistaria sinensis*. Messrs. Todd & Co. exhibited flowers of *Narcissus poeticus ornatus*. Messrs. Downie & Laird exhibited trusses of white and speckled onions. Mr. May exhibited Radishes which had grown in the open air last winter. Miss Ann J. Hope Johnston, of Marchbank, Moffat, exhibited Bay Laurels in flower, showing the mid nature of the season.

Nottinghamshire Horticultural and Botanical: April 13.—The third monthly meeting of this Society was held at the rooms, Morley House, Nottingham, and there was a large attendance of members and friends. Mr. Edmonds, The Gardens, Bestwood Lodge, occupied the chair. Mr. German, of Mansfield House Gardens, read an essay on the *Dendrobium*, more particularly dealing with *D. nobile*, which he traced from its first introduction into this country. A long and interesting discussion afterwards took place among the members present, and the essays were awarded a cordial vote of thanks for his paper. There was a fair show of plants and cut blooms. Mr. Anderson, of Clifton Hall, sent a specimen of *Dendrobium thrysiiflorum*, bearing three fine spikes. Mr. Edington, of Woodhouse, Orange, sent a specimen of *Gardenia* and some cut blooms; he explained that his plants were grown in 6-inch pots, that they were small and bushy,

and, like the plant shown, were one mass of blooms; in fact, from less than a score of such plants he had cut upwards of sixty dozen blooms in less than three weeks, and they looked like *Aspidistra* as long again. The cut blooms shown were remarkably full and of great substance. Mr. Edmonds, of Bestwood Lodge, sent a nice collection of cut Carnations, very excellent for early work, which were greatly admired. A vote of thanks having been awarded the various exhibitors, the proceedings terminated.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, APRIL 19, 1882.

- April 13.—A dull, overcast, damp, rainy day. Wild, windy, rainy night.
- 14.—A fine bright day, with occasional showers of rain, fine clear night.
- 15.—A fine day, overcast, great gloom, thunder. Fine but cool night.
- 16.—Fine bright day. Fine still evening; very slight during the evening.
- 17.—A dull, drizzling, overcast day; thin, drizzling rain at night.
- 18.—A dull day, gleams of sunshine at intervals. Fine cold night.
- 19.—A dull, cloudy, damp morning, a cloudy day; dark, still, fine night.

LONDON: Atmospheric Pressure.—During the week ending April 15, the reading of the barometer at the level of the sea decreased from 30.32 inches at the beginning of the week to 29.01 inches by midnight of the 13th, and was 29.69 inches at the end of the week.

The mean reading for the week at the level of the sea was 29.73 inches, being 0.41 inch below last week, and 0.20 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 61°, on the 9th. On the 13th and 15th the highest temperature reached was 52°. The mean of the seven high day temperatures was 56°.

The lowest temperature in the shade in the week was 36° 2, on the 10th; on the 13th the lowest temperature was 47°. The mean of the seven lowest temperatures was 40° 5.

The greatest range of temperature in one day was 23°, on the 9th; the smallest was 5° 5, on the 13th. The mean of the seven daily ranges was 15° 5.

The mean temperatures were, on the 9th, 46° 3; on the 10th, 44°; on the 11th, 45° 5; on the 12th, 47° 6; on the 13th, 49°; on the 14th, 50°; and on the 15th, 46° 2. Of these that of the 10th, 11th, and 15th, were 1° 7, 0° 3, and 0° 3 respectively below their averages; and those of the 9th, 12th, 13th, and 14th, were 0° 2, 1° 7, 2° 9, and 3° 7 above their averages respectively.

The mean temperature of the air for the week was 46° 9, being 1° 2 lower than last week, and 1° above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo, placed in the full rays of the sun, was 128° on the 9th; the highest on the 15th was 60°.

The mean of the seven readings was 91° 4.

The lowest reading of a minimum thermometer with its bulb placed on grass and fully exposed to the sky, was 33° on the 9th and 12th. The mean of the seven readings was 36° 5.

Rain.—Rain fell on two days to the amount of 0.43 inch.

ENGLAND: Temperature.—During the week ending April 15 the highest temperatures were 63° 5 at Nottingham, 63° 3 at Cambridge, and 65° at Truro. The highest temperature at Hill and Sunderland was 56°, and at Bristol 56° 2. The general mean was 59° 3.

The lowest temperatures in the week were 29°.8 at Wolverhampton, and 30° at Truro and Hull. The lowest temperature at Brighton was 37°, at Blackheath 36°.2, and at Plymouth 35°. The general mean was 32.6.

The greatest ranges of temperature in the week were 33° at Truro, 32°.8 at Cambridge, and 32°.6 at Nottingham. The least ranges were 22°.8 at Bristol and 23° at Brighton and Sunderland. The general mean was 26°.7.

The mean of the seven high day temperatures was highest at Truro, 59°.8, at Cambridge 58°.7, and at Nottingham 58°.4; and was lowest at Hull, 51°.3, at Sunderland 51°.5, and at Sheffield 52°.4. The general mean was 55°.2.

The mean of the seven low night temperatures was highest at Plymouth, 42°.2, at Brighton 41°.8, and at Truro 41°.4; and was lowest at Sunderland, 36°, at Bradford 36°.5, and at Bolton 36°.6. The general mean was 38°.7.

The mean daily range was greatest at Nottingham, 21°.1, at Wolverhampton 19°.9, and at Cambridge 19°.5; and was least at Brighton, 13°.6, at Bristol 13°.9, and at Hull 14°.1. The general mean was 16°.

The mean temperature for the week was highest at Truro, 49°.2, at Plymouth 48°.4, and at Cambridge 47°.6; and was lowest at Sunderland, 42°.3, at Hull 42°.9, and at Sheffield 43°.2. The general mean was 45°.6.

Rain.—The largest falls were 1.89 inch at Bolton, 1.73 inch at Hull, and 1.64 inch at Sunderland. The least falls were 0.41 inch at Wolverhampton, 0.43 inch at Blackheath, and 0.55 inch at Nottingham. The general mean was 1.10 inch. It fell on an average of from three to four days in the week.

SCOTLAND: Temperature.—During the week ending April 15 the highest temperature was 59°, at Greenock; at Aberdeen the highest temperature was 46°.7. The general mean was 51°.9.

The lowest temperature in the week was 28°.5, at Glasgow and Edinburgh; at Greenock the lowest temperature was 33°.5. The general mean was 30°.2.

The mean temperature for the week was highest at Paisley, 42°.6; and was lowest at Aberdeen, 38°.6. The general mean was 40°.8.

Rain.—The largest fall was 3.25 inches, at Dundee; the smallest was 0.45 inch at Greenock. The general average fall was 1.48 inch.

JAMES GLAISHER, F.R.S.

Obituary.

G. H. HOFFMAN, a man of high scientific attainments, and of the most genial character, passed away from us on the last day of March, after twenty years of suffering, which daily increased till there was a complete wreck of one of the finest minds and most diversified talents with which it has been the privilege of the writer of these notes to have been associated. Mr. Hoffman was born in the year 1805 at Margate, where he practised as a medical man with great success till his illness in 1861. During the prevalence of cholera in that town in 1832 he was most actively employed, and notwithstanding his daily labour he stole many hours from the night watches to investigate more closely the phenomena of the disease, and with such success that his memoir, which appeared in the *London Medical Journal*, was translated in the *Annales des Sciences Naturelles* in 1834, vol. 1, and in German by Dr. Magnus. In the course of his investigation the important fact was ascertained that venous blood once arterialed by the addition of salts in the proportion in which they are normally present in the blood cannot be arterialed a second time by the addition of fresh salts. At the same time he paid great attention to comparative anatomy, a specimen of which was given in his article on "Cerithium Telescopium" in the twentieth number of *Sowerby's Zoological Journal*. His attention, however, was readily turned to every subject of interest, and it was mainly owing to his investigations that Mr. Tucker was able to conquer the Vine Midge when it first appeared in this country, though Mr. Tucker derived from it nothing more than the empty honour of having his name recorded in that of Oidium Tuckeri, the French Government entirely ignoring his merits, and giving the credit to another.

Mr. Hoffman next turned his attention to a disease which was prevalent in Onions, and succeeded in getting the little *Sclerotium* to germinate and produce a minute species of *Mucor*, as recorded in the *Horticultural Journal*, vol. iii., p. 91. He effected this by clever manipulation with closed cells, a method which has since been carried out more extensively. By the same method he succeeded in getting isolated

globules of yeast to produce the common *Penicillium*, as detailed in Morton's *Cyclopaedia of Agriculture*, under the article "Yeast Plant."

It is curious that the sporangia produced by lirefid in the course of his observations on *Penicillium* seem identical with what Rees produced from yeast globules, which, if they occurred, were at least not understood in 1851.

Much more might have been said if this were the place to speak particularly of his excellence as a surgeon, for which profession his constructive powers as a mechanic gave him great facilities, for he was equal to making any instrument, even to a compound microscope.

His remains were deposited at Margate, and a well-written article is given in Kelle's *Margate Gazette* on the occasion. The feelings which have given rise to the present slight memoir are exactly expressed in the following lines of Wordsworth, in the *Excursion*:—

"Strongest minds
Are often those of whom the world
Hears least, else sure this man had not left
His graces unrevealed and unproclaimed,
So not without distinction he had lived
Beloved and honored as far as known."

M. J. Berkeley.

— WITH deep regret, which will be shared by very many of our readers, we have to record the sudden death of the Rev. JOHN GUDGEON NELSON, Rector of Aldborough, Norwich, which took place on the morning of the 14th inst. Mr. Nelson, a clergyman of portly presence, had been for the last twenty-two years rector of Aldborough, and had besides made for himself a name in the annals of horticulture. He was a man of strong sympathetic feeling, a quiet, plodding worker in the horticultural vineyard, and inherited a passionate love for plants from his father (who was also a great gardener and the raiser, amongst other things, of the pretty little *Phlox Nelsoni*); and so strongly was this taste developed from infancy that when a youth he determined to be a nurseryman, and went to the Clapton Nursery, where he remained till he found that commercial horticulture was not his vocation, when he entered the Church, while continuing the cultivation of the plants he loved so well. It is to him that we are indebted for some seedling *Phloxes* of a very charming character, raised by him from seeds of *P. subulata* and *P. Nelsoni*, drawings of which were published in the *Garden* in the early part of last year, and there it is stated, on the authority of the late Mr. Noel Humphreys, that the raised mound, several yards in length, upon which the general crop of seedlings was sown, exhibited a delicately-blended mass of colour which was exquisitely beautiful. The undulations caused by the various tufts where each plant asserted a gentle pre-eminence cast soft masses of tender shadow, which varied the general effect of the flower-clothed ridge in a charming manner. This delightful floral composition suggested the idea that portions of rockwork might be advantageously closely planted with these charming varieties of dwarf *Phloxes*. The varieties figured include forms with bright rose, white, rosy-azure, pink, and mauve-pink flowers. To Mr. Nelson we are also indebted for the *Lachenalia Nelsoni*, one of the most charming of greenhouse bulbs, the result of a cross between *L. area* and *L. luteola*, and by combining the rich orange colouring of the former with the free-growing abundant-blooming habit of the latter plant taking a higher position as an ornamental plant than either of its parents. With thorough unselfishness Mr. Nelson has freely distributed this later acquisition amongst those who were likely to prize it at its true worth; and it is gratifying to know that he was spared long enough to see his labours in this direction appreciated, and his efforts to contribute towards the improvement of the flowers he took in hand daily honoured by his horticultural competers. His eye was so keen, and his judgment in floral matters so sound, that it is indeed to be regretted that he did not more fully and frequently record the results of his observations. The experiences of a man who cultivates a particular class of plants with zeal and discrimination for a series of years is always most valuable. His notions of the extent of variation and the limits of specific forms must needs be much more correct than that of others whose line of study and other occupations forbid more than a temporary examination. In this matter Mr. Nelson literally died in harness. To the last he was occupied in the

cultivation and careful discrimination of *Narcissi*, as is witnessed by some detailed correspondence before us written immediately prior to his decease. Mr. Nelson's death removes from our ranks one of the most amiable and acute of plant lovers, whose loss will be severely felt by those who had the pleasure of his acquaintance.

Enquiries.

He that questioneth much shall learn much.—BACON.

HOW TO FORM A ROOKERY.—Can any of your readers kindly inform me how to establish a rookery? I have tried putting old nests into some high Elm trees, but they have not been taken to, although rooks are often in the trees. *The Mag.*

Answers to Correspondents.

FUNGUS ON JUNIPERUS SABINE: *Cor.* The name of some fungus which some observers believe it to be another condition of the fungus sometimes very common on Pear leaves, and named *Rustelia cancellata*. *W. G. S.*

FUNGUS ON MUSHROOM BEDS: *J. C. A.* The name of this fungus is *Agaricus cepes*. It is of exotic origin, and sometimes a great pest in greenhouses and stoves. It does not generally grow in the open air. *W. G. S.*

JOBING BUSINESS: *A. Gray.* We cannot undertake advice you as to where there is a good opening for a seedsman and jobbing gardener.

LABEL COMPETITION: *Doubtful.* To the Secretary of the Society of Arts, John Street, Adelphi, London, W.C.

LAWN TENNIS: *Pileum.* The Eclipse is one of the most efficient markers; 6, *Agar Star*, Strand.

NAMES OF PLANTS: *H. T. B.* 1, *Rubus spectabilis*; 2, the common Quince; 3, probably *Crataegus coccinea*—specimen insufficient. The proper name of the *Spiraea* you sent last time is *S. pranifolia*, double-flowered variety, not what we stated in a former number—*Z. Perry.* *Orontoglossum Cordata*, we believe—"438." 1, *Pulmonaria officinalis*; 2, *Anemone coronaria*; 3, *Sedum reflexum*, var. *monstruosum*; 4, *Kleinia repens*; 7, *Forsythia suspensa*; 8, *Helianthemum* sp. The others we do not recognize—*Agaric.* A species of *Maxillaria*, which we are unable to identify.

ORCHIDS: *H. J. R.* Both your *Dendrobium* are macrophyllum, Lindl., *Sert.* 35, macranthum, Hook. *Bot. Misc.* 3970. Both names having been anticipated by Achille Richard, the younger Reichenbach proposed the name *superbum*. If you will compare your greater flower with the figure given by Sir William Hooker, you will see that it has quite the same size. At San Donato most probably your very same plant bore the name of *Dendrobium macrophyllum pallidum* (see *Planchon, Hortus Donatensis*, p. 156). It is, however, quite as vivid in colours as any other. *Dendrobium ansumum* is an obscure plant, said to be scentless—perhaps during cold weather—and represented with almost elliptical petals. I never saw anything quite like it. Every plant may yield fresh variations, as animals and men. In the *acm.* of *Cinchona* introduction Sir William Hooker showed me a single seedling of *Cinchona* surpassing three (3) times all its brethren. I remember with pleasure how the excellent old gentleman was interested in showing his pet. A Leipzig gentleman, Herr Gruner, went to dreafel peninsula to have a collection of European butterflies only containing four giant individuals of each, and sometimes the most minute dwarfs. Boisduval, of Paris, told me that this collection, now kept at Dresden Museum, was quite a wonder. We have some original collectors of Orchids, only one collecting individuals with the largest flowers, and one only collecting hybrids. *H. G. Reichenf.*

PACARDI, OR PACARDII: *J. S.* Supposing the Latin name to be *Pacardii*, which is most in accordance with Latin usage, then it should be written *Pacardi* in the genitive, meaning of or belonging to *Pacard*; but if you suppose the name to be *Pacardius*, like *Georgius*, then you must use the double *i*. In most cases it is a mere matter of fancy.

PHYLLOXERA: *P. M.* The roots were quite dry and shrivelled, but we were unable to find any trace of the Phylloxera.

PECKLY PEAR: *Physiologist*, 1, yes; 2, soap.

SUMMER CLOUD: *N. O. D.* If put on according to instructions, either outside or in, according to desire, it leaves a thin pale green film on the glass, which answers perfectly as a shading if a permanent shade is desirable.

VINES: *H. R.* Not the work of insects, but the result of a slight check to growth from a chill or draught. It will not do much harm if you treat them carefully.

VIOLETS: *N. O. D.* All Violets should have some scent, but some plants have more than others—why, we cannot say.

WALKS: *Jumbo.* Twelve inches in depth would be the best, if you have plenty of rough ball to fill in the bottom with; but if the subsoil is free and open 9 inches would do. We can tell you nothing as to

the cost of such work in the North of England, so much depending upon the cost of labour.

* Correspondents are specially requested to address post-paid, all communications intended for publication to the "Editor," and not to any member of the staff personally. The Editor would also be obliged by such communications being written on one side only of the paper and sent as early in the week as possible.

Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editor.

FOREIGN SUBSCRIBERS sending Post-Office Orders are requested to make them payable to William Richards, at the Post-Office, King Street, Covent Garden, London, and at the same time to inform the Publisher at the office of this Journal.

Markets.

COVENT GARDEN, April 19.

Trade remains the same, with no alteration in prices. James Webber, Wholesale Apple Market.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Flower name and price. Includes items like Abutilon, Anemone, Arum lilies, Azalea, Carnation, Cineraria, Cyclamen, Eucharis, Gardenias, Hyacinths, Lilacs, and Pansies.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Plant name and price. Includes items like Aralia Sieboldii, Arabis, Begonia, Cineraria, Cyclamen, and various ferns and succulents.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with 2 columns: Vegetable name and price. Includes items like Artichokes, Asparagus, Beans, Beet, Broccoli, Carrots, Cauliflowers, Celery, Cucumbers, and various herbs.

FRUIT.—AVERAGE WHOLESALE PRICES. Table with 2 columns: Fruit name and price. Includes Apples, Figs, Gooseberries, Grapes, and Kent Cobs.

SEEDS.

LONDON: April 19.—Although the season is now drawing to a close, there is still an active demand for all kinds of seeds. Stocks of all varieties are exceedingly light, and it seems probable that some articles will be cleared up completely by the time the trade finishes.

CORN.

At Mark Lane on Monday fine English Wheat was fully 1s. dearer than last reported, and foreign sundries a similar advance, but the wheat was rather quiet.

CATTLE.

At Copenhagen Fields on Monday increased supplies and less favourable weather weakened prices in the beast market, sales making but slow progress at a reduction of 2d. per stone.

HAY.

Tuesday's Whitechapel Market reports state that with good supplies and fair demand, prices were steady. Quotations:—Prime Clover, 120s. to 135s.; inferior, 70s. to 95s.

POTATOS.

The Borough and Spitalfields Markets report state that good supplies are to hand, and a steady demand prevails for best qualities. Quotations:—Scottish Champignons, 50s. to 60s.; ditto Regents, 70s. to 80s.;

COALS.

The following are the prices current at market during the past week:—East Wylam, 15s.; Walls End, Hetton, 15s. and 15s. 6d.; Hetton Lyons, 13s. 6d. and 14s.;

Government Stock.—Consols closed on Monday at 103 to 103 1/2 for delivery, and 103 1/2 to 103 1/2 for the account. Tuesday's business closed at Monday's figures for both delivery and account.

This Design was invented by Messrs. SUTTON & SONS, in July, 1881, and is their property.

Messrs. Suttons' Customers are hereby cautioned against imitations.

THE QUEEN'S SEEDSMEN, READING.

SHANKS' PATENT LAWN MOWERS.

The only Lawn Mower fitted with Double-edged Sola-plate, which enables the Cutting Parts to Last Twice as Long as in other Machines.

H A N D M A C H I N E .

Table with 2 columns: Mower size and price. Includes sizes like 10 to 12 inches wide and 12 to 14 inches wide.

"THE YANKEE" LAWN MOWER.

Table with 2 columns: Mower size and price. Includes sizes like 10-inch, 12-inch, and 14-inch.

Will Cut either Long or Short Grass.

"THE WAVERLEY" LAWN MOWER.

Table with 2 columns: Mower size and price. Includes sizes like 10-inch, 12-inch, and 14-inch.

A New Machine. Very Easily Worked.

ALEX. SHANKS & SON, DENS IRONWORKS, ARROATH, FORKFAIRSHIRE. 27, LEADENHALL STREET, LONDON, E.C.

"ARCHIMEDEAN" AMERICAN LAWN MOWERS.

HIGHEST PRIZE

At the PARIS EXHIBITION, 1879; And the Jury, in their Report, say—"The ARCHIMEDEAN" did the BEST WORK of any Lawn Mower exhibited."

ALSO AT SYDNEY EXHIBITION, 1879-80, AND AT MELBOURNE EXHIBITION, 1880-81.

OPINIONS OF THE PRESS.

"Far superior to any of ours,"—Vide The Field. "Remarkably easy to work,"—Vide Gardener's Magazine. "The quickest, most simple, and most efficient mower ever used,"—Vide Gardener's Chronicle. "We feel bound to recommend it to our readers as one of the best mowers we have as yet made acquaintance with,"—Vide Floral World.

Prices from Twenty-five Shillings.

Delivered Carriage Free to all Railway Stations in Great Britain.

WILLIAMS & CO. (Limited), Manufacturers and Patentees.

SELLING AGENTS:

JOHN G. ROLLINS & CO. (Limited), OLD SWAN WHARF, THAMES ST., LONDON. WALTER CARSON & SONS, LA BELLE SAUVAGE YARD, LUDGATE HILL, LONDON; and BACHELOP'S WALK, DUBLIN.

QUEEN PINES.—56 clean healthy Fruiting and Succession Plant to be Disposed of cheap.—J. BAGGY, The Gardens, Embury Court, Thames Ditton.

PRIMUMS.—The best strain in the World, 2s 6d. per dozen, very strong plants, ready for potting. VERBENA and MINULUS, very strong plants, 1s. per doz. LOBELIA, Emperor William, 2s. per dozen.

Free by post. Cash with order. JAMES GILL, Spring Place Nursery, Shearbridge, Hutton Road, Bradford.

Special Offer.—7,000,000

GEE'S superior CARBAGE, KALE, SAVOY, CAULIFLOWER, and other PLANTS; ASPARAGUS and SPINACH. SEEDS, BEDFORDSHIRE-GROWN SEEDS, POTATOES, &c.

GEE is prepared to supply the above in any quantities for each with orders as follows:—

CARBAGE PLANTS, which are this season splendid, strong, healthy, fibrous-rooted stuff, grown from his far-famed selected stocks, comprising Early Behead, Early Nonpareil, Early Dwarf York, Imperial Thousand-Head, and extra large Drumheads, all 3s. per 1000 of 1200s. Very fine plants can also be supplied of above kinds, which are not grown from F. GEE'S own stocks, but which he believes are very good.

CAULIFLOWER PLANTS, splendid transplanted stuff, 5th, 6th, Autumn Giant at 20s. per 1000, 2s. 6d. per 100; Early London and Waltham, 15s. per 1000, 2s. per 100.

ASPARAGUS PLANTS, of the Dark Early, the true French Market sort, insignificant healthy stuff (recommended for making New Beds), 3s. per 1000; 25s. per 1000.

SPINACH, 5s. per 1000, and 12s. per 1000, sown by the 1000. RHUBARB ROOTS, Early Scarlet, Prince Albert, and Victoria, 2s. 3s., and 4s. 5s. per dozen, from 20s. per 100.

SAGE and COMMON THYME roots, at 3s. per 100, 2s. per 1000.

SAISIES, choice sorts, Jaechus' Dark Scarlet, and others, at 4s. 6d. per 100, 20s. per 1000.

SEEDS, choice sorts, Jaechus' Dark Scarlet, and others, at 4s. 6d. per 100, 20s. per 1000.

SEEDS, choice sorts, Jaechus' Dark Scarlet, and others, at 4s. 6d. per 100, 20s. per 1000.

SEEDS, choice sorts, Jaechus' Dark Scarlet, and others, at 4s. 6d. per 100, 20s. per 1000.

SEEDS, choice sorts, Jaechus' Dark Scarlet, and others, at 4s. 6d. per 100, 20s. per 1000.

SEEDS, choice sorts, Jaechus' Dark Scarlet, and others, at 4s. 6d. per 100, 20s. per 1000.

A CATALOGUE OF AURICULAS, OLD AND NEW,

Published at the Gardeners' Magazine Office, 4, Ave Maria Lane, London, E.C.; and may be had of all Newsvendors and Booksellers.

NATIVE GUANO,

SUITABLE FOR ALL CROPS.

Price, £3 10s. per Ton, in Bags, at Aylesbury.

A single 1 cwt. Sample Bag sent, Carriage Paid, to any Railway Station upon receipt of Post-office Order for 5s.

This valuable Manure, prepared from Sewage by the "A. B. C." process, has been extensively used, for several years, by Farmers, Gardeners, and others, whose reports testify to its fertilising properties.

EXTRACTS FROM LATEST SEASONS' REPORTS:—

WILLIAM CRUMM, Gr. to Duke of Marlborough, Blenheim Palace Gardens, December 25, 1881.

"Used for Vines, Peach trees, and other fruit trees, also Potatoes, Carrots, Parsnips, Onions, &c. Results: satisfactory. Fruit trees assumed rich dark green foliage, increased vigour, whilst the fruit swelled up to a very fine size. Potatoes came out in splendid condition; other roots too were benefited by its application. No other manure used with Native Guano. Undoubtedly a valuable fertilising agent, and I shall lose no opportunity of recommending it to gardeners and others."

A. BLAKE, Head Gr. to H. Casanova, Esq., The Lilies, Wotton, January 31, 1882.

"Used for Peas, Potatoes, Onions, Cabbage, Cauliflowers, Celery, Vines, Cucumbers, &c.: Chrysanthemums, Pimulas, Geraniums, Fuchsias, &c. Results: Onions, Cabbage, Cauliflowers, and Peas good; Cucumbers, first-rate; Potatoes, a good crop, and I consider it a good manure for pot plants. I think the Native Guano only requires to be more known to the public to be largely used."

Sixteen Prizes awarded at Birmingham Show, 1881.

The Annual Show of Farm and Garden Produce, grown with Native Guano, will be held at Aylesbury in October next. Schedules and Prizes and all particulars, together with testimonials, &c., may be obtained upon application to

The Native Guano Company (Limited), Aylesbury, Bucks.

AURICULAS.—A fine collection of the above, also of many other plants worthy of inspection, may now be seen in flower at Messrs. JAMES DICKSON AND SONS, Newton Nurseries, Chester.

(bags included); truckload of about 250 bushels, 25s. cash; all free on rail. J. STEVENS AND CO., Greyhound Yard, and 134, High Street, Battersea, S.W.

THE "AUTOMATON."

Sizes, 8 to 22 inches.
THE BEST GENERAL PURPOSE MACHINE.

The "AUTOMATON" Lawn Mowers are thoroughly strong, well-made, and durable machines, and the best suited for general work and *Golfers'* use. They cut the grass perfectly, leave no ribs, but produce a smooth velvet surface on the Lawn, and are light in draught.

The "AUTOMATONS" have front rollers for general work, and side rollers for cutting long grass, or when it is necessary to roll the grass in front of the cutters. They have the best machine-made gearing, the best self-sharpening knives of steel and iron rolled together, and automatic silent drivers.

R. H. & J. also manufacture "REVERSIBLE" Lawn Mowers for Small Gardens and Borders, and "HORSE-POWER" Lawn Mowers for large Lawns, &c.

THOUSANDS IN USE.
 SENT CARRIAGE PAID.
 MONTH'S TRIAL ALLOWED.
 NO CHARGE FOR PACKING.

RANSOMES' LAWN MOWERS ARE THE BEST. THE HIGHEST AWARDED.

COMPLETE PRICE LISTS FREE BY POST.

STOCK KEPT IN LONDON at Arch 92, Spitalfields Station, Bethnal Green, E., and Machines may be ordered from any respectable Ironmonger.

Ransomes, Head & Jefferies,
 ORWELL WORKS, IPSWICH.

THE "WORLD."

Sizes, 8 to 24 inches.
FOR CUTTING LONG GRASS.

The "WORLD" (late "GLOBE") Lawn Mowers are intended for cutting long grass; and, whilst similar to the Lawn Mowers imported from America, have the special advantages of the more accurate fitting and general durability of English manufacture and perfect adjustment.

The "WORLDS" will cut wet, dry, long, or short grass without clogging, and cut off almost all the "bents." They leave the surface smoother than similar machines, and are well adapted for getting over a large amount of work with little labour.

GARDEN REQUISITES

COCO-NUT FIBRE REFUSE.

GISHURST COMPOUND.—Used by many of the leading Gardeners, since 1859, against Rod-spider, Midges, Thrips, Greenfly, and other Blight, in solutions of from 1 to 2 oz. to the gallon of soft water, and of from 1 to 16 oz. as a winter dressing for Vines and Fruit Trees. Has outdone many preparations intended to supersede it. In Boxes, 16s. 3s., and 10s. 6d.

AMERICAN BLIGHT ON APPLE TREES CURED by rubbing a wet hard Painter's brush on Gishurst Compound, and working the latter into the infected part.

GISHURSTINE keeps feet dry, softens hard boots, preserves leather, tacks a polish. In Boxes, 6d. and 1s. each.

Wholesale by PRICE'S PATENT CANDLE COMPANY (limited). Retail by Seedsman and Oilmen.

REGAL SILVER SAND.—Coarse and fine, on rail at 7s. per ton—less than 4-ton trucks. Terms cash.—Apply to H. SIMS, The Friary, Reigate.

Oil Paint No Longer Necessary. HILL AND SMITH'S BLACK VARNISH for Preserving Brickwork, Wood, or Stone. (Registered Trade Mark)

This VARNISH is an excellent substitute for oil paint on all outdoor work, which it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 30 gallons each, at 1s. 6d. per gallon at the Manufactory, of 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.—I have this day forwarded from Chep-stow to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chep-stow. I am, Sir, yours respectfully, Wm. Cox."

CAUTION.—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years, and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade mark as above, without which none is genuine.

Large Illustrated CATALOGUE of Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to: HILL AND SMITH, Brierley Hill Ironworks, Staffordshire; 128, Queen Victoria Street, London, E.C.; or 180, Buchanan Street, Glasgow.

PAINT.—Large quantity for Sale, especially prepared for Horticultural Buildings, Greenhouses, &c., 2s. 6d. per lb.—all colours.—Improved Zinc White Paint, 4s. 6d. per lb. Cash.—A. LEETE & CO., 129, London Road, Southwark, S.E.

HOSE—HOSE—HOSE.

PATENT RED-RUBBER GARDEN HOSE.

Stands severe tests of Government Departments, thus proving superiority of quality. Lasts four times as long as ordinary Indian Rubber Hose, lighter in Weight, Greater in Strength, and Cheaper in the long run than any other Hose for Garden Use.

A correspondent writes—"I have had a length of your Red-Rubber Hose in use nine years, and it is now as good as ever." Private Customers Supplied at Trade Prices.

Sample and Price of MERRYWEATHER & SONS, Manufacturers, 63, Long Acre, London, W.C.

THE NEW GARDEN HOSE, made upon the principle of the fire hose used by Captain Shaw, C.B., Chief Officer of the Metropolitan Fire Brigade. It is much cheaper and far more durable than white rubber, or fabric hose. Private customers supplied at trade prices. Sample free. MERRYWEATHER & SONS, 63, Long Acre, London, W.C. Works: Greenwich.

WANTED, a HORSE MOWING MACHINE, in good condition. State size and price to J. GOUGH, The Gardens, Harfield Grove, Uxbridge.

CARPENTER, or HANDY-MAN, on a Gentleman's estate.—Age 31, nine years' character.—E. C., 3, Highbury Park, N.

EPPS'S COCOA. By a thorough knowledge of the natural properties of the cocoa bean, which has been the basis of the operations of digestion and nutrition, and by a careful application of the fine properties of the best selected cocoa, Mr. Epps has provided our breakfast tables with a delicately-flavoured beverage which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every temptation to disease. Hundreds of subtle maladies are floating around us ready to take advantage of every weakness. We may escape many a fatal shal by keeping ourselves well fortified with this health giving and properly-nourished frame.—Coca-Cola Service Co. Made simply with boiling water or milk. Sold only in packets, labelled. JAMES EPPS AND CO., CHOCOLATE AND TOFFEE MANUFACTURERS, LONDON. Makers of Epps's Chocolate Suitable for Afternoon Use. The Speediest Remedy for Throat and Chest Affections. "In spite of the many novelties and largely advertised 'new preparations' for the Croup and Croup, I find DR. LOCKOCK'S PULMONIC WAFERS still rank as affording the speediest relief in Throat and Chest Affections."—Dr. J. W. P. S., 1, Upperdown, Bristol, Jan. 1882. They instantly relieve and rapidly cure Asthma, Consumption, Bronchitis, Croup, Croup, Croup, Shortness of Breath, Pleurisy, &c., and are pleasant and taste pleasantly. Sold at 1s. 6d. and 2s. 6d. per box, by all Druggists.

HOLLOWAYS' PILLS and OINTMENT. Diseases of Women.—Medicinal science in all ages has been directed to alleviate the many maladies incident to females, but Professor Holloway, by diligent study and attentive observation, was induced to believe that he had discovered a remedial remedy for those special diseases. He has, after vast research, succeeded in compounding his celebrated Pills and Ointment, which eminently have been proved to be a most efficient cure of disorders peculiar to women of all ages and constitutions, whether residing in warm or cold climates. They have repeatedly cured, and are now being administered, in the most distressing cases of such diseases, and still more satisfactory is it that the malady is relieved completely and permanently.

KEITH'S PATENT HOT-WATER BOILERS.

Can be heightened or lowered, or made to suit any requirements. They stand complete in themselves, and require no building work, being wholly water-jacketted and thus entirely free from risk by fire. They can be had all sizes, to heat from, say, a few feet, up to 8000 feet of 4-inch pipe each; are now in all parts of the world, and are universally as being the best, most powerful, and most economical Hot-water Boilers in use.

Specimen Extracts from Testimonials,

From W. MORGAN ROBBINS, Esq., *Architect, Liverpool.*
September 9, 1880.
 "I am delighted with your Boiler; it answers admirably, and the directors are satisfied that it is one of the best £45 worth ever put in the hotel."
 From Q. C. CHALMERS, *Gardens of James Mudie, Esq., Broughty Ferry, September 15, 1880.*
 "Your Boiler heats all my expectations, at present one fire serves for twelve hours, and keeps up a good, steady heat."
 From ISAAC HOLDEN, Esq., *Oakworth House, Keighley, Yorkshire, June 10, 1881.*
 "Your Boilers are the best we have tried." (Note: one of these Boilers heats nearly 8000 feet of 4-inch pipe).
 From WM. FRASER, *Kippen Gardens, Dunning, Perthshire, December 6, 1881.*
 "I consider your Boiler most efficient; as for economy, it is the acme of perfection."
 From Rev. JAMES CARDWELL, *Military Academy, Highlands, Jersey, December 11, 1881.*
 "Nothing could be better than the boiler you sent me; it burns all sorts of rubbish, and gives an excellent heat."
 From ARTHUR HOOTY, Esq., *Rose Villa Nurseries, High Harrogate, March 22, 1882.*
 "Your Boiler has exceeded all my expectations; it will pay for itself as a fuel saver in a short time. It heats 2000 feet of 4-inch pipe."
 Keith's Treatise on "Heating by Artificial Means," post-free for twelve stamps.

JAMES KEITH,
 GAS, HYDRAULIC, AND HOT-WATER ENGINEER,
 EDINBURGH AND Ayr.

"THE COVENTRY." (REGISTERED).

NETTLEFOLD & SONS desire to call special attention to their "COVENTRY" LAWN MOWER, which they can confidently recommend as the best and cheapest in the Market.
 It has all the improvements which have of late been introduced into this class of Machine, either in England or America; and for the manner in which it does its work, its lightness, and the ease with which it can be used, cannot be surpassed. Its cheapness brings it within the reach of every one, and in this respect it defies competition with any American machine before the public. It is made, as its name implies, at Coventry, by skilled English workmen, and of best English Steel and Iron. These Machines can also be supplied with ROLLERS AT SAME PRICE, and GRASS BOXES at a small extra cost.

NEW GARDEN PLEASURES!

W. H. Cullingford, Esq., writes thus:—
(The Gardener, April 22, 1881.)

"**NICOTIANA AFFINIS.**—Will the wonders connected with this plant ever cease? It is a universal favourite wherever seen, and is equally at home in the conservatory and in the cottagers' window. The elegance of its flowers delights, its perfume is unique and very grateful, and the vagaries of opening and shutting its blooms are a surprise to all. As a tender annual nothing can excel it, for it blooms and blooms from early summer until late in autumn, and if taken up no doubt would grow again next season. The greatest characteristic of this plant has, however, to be told."
We are the only firm probably in Europe that grew and saved the seed of this extraordinary plant, which enables us to offer it as Seedlings.

Malva moschata alba major.

Awarded a First-class Certificate by the Floral Committee of the Royal Horticultural Society last year, and is certainly one of the most splendid hardy plants that we have, producing an abundance of pure white flowers equally beautiful and valuable as the above.

Single Dahlias (Seedlings).

Saved from all the best varieties in cultivation, and will make a splendid show all the season.

SEEDLING PLANTS of these Novelties, 2s. per dozen, post-free. Nice plants in pots, 6s. per dozen; larger plants, 12s. per dozen.

H. CANNELL & SONS,

ORCHIDS.

The Largest and Best Stock in Europe of good Established Plants. Tens of Thousands of Plants to select from.

MR. WILLIAM BULL

Begs to intimate that his Orchid-houses are always quite a sight, from the large number of plants in flower, and he will be pleased to show them to any one interested in this beautiful class.

MR. WILLIAM BULL

Recommends those desirous of having their Houses gay with Orchid flowers, to purchase good established well-cultivated plants, which bloom well, are far more satisfactory, and comparatively cheaper than newly imported or semi-established plants.

Establishment for New and Rare Plants,
536, KING'S ROAD, CHELSEA, LONDON, S.W.

BALCHIN'S DOUBLE WHITE MIGNONETTE

(RESEDA ODORATA PROLIFERA ALBA).

Awarded First-class Certificates—Royal Horticultural Society, May 24, 1881; Royal Botanic Society, May 25, 1881.

OPINIONS OF THE PRESS:

See JOURNAL OF HORTICULTURE and COTTAGE GARDEN, May 26; GARDENERS' MAGAZINE, May 28; THE GARDEN, May 28; and also Rev. GEORGE HENSLOW'S Letter in GARDENERS' CHRONICLE of August 6, 1881, and Extract from GARDEN, April 8, 1882.

This is, without doubt, the most remarkable Mignonette ever introduced. When first coming into bloom it resembles the ordinary kind, only that the flowers are double, forming little balls of minutely fringed petals. It has a stout, free-branched habit, and produces immense spikes of pure white, richly scented flowers. The peculiar part about it is that instead of seeding as in the ordinary kind, each individual bloom produces fresh branchlets of flower, forming a huge spike of over a foot long,

with elegantly depressed branches thickly covered with bloom. It is very handsome totally unlike the very finest of the ordinary Mignonette, and may safely be described as the finest strain yet introduced to public notice, and equally deserving the attention of Private and Market Growers. I have grown single plants in my nursery of one year's growth measuring 2 feet 6 inches in height and 2 feet in diameter, and bearing spikes of bloom averaging from 12 to 16 inches in length, and 6 to 8 inches in width at the base.

Strong plants now ready, in 5-inch pots, 7s. 6d. each; in 3-inch pots, 5s. each.

All Orders will be executed in strict rotation. Terms cash.

Address—W. BALCHIN, Hassocks' Gate Nursery, Sussex; or, 87, Western Road, Brighton.

DENDROBIUM FORMOSUM GIGANTEUM.

HEATH AND SON

Beg to announce the arrival of an immense importation of the above, from the same locality in Upper Burma as those last year, which gave such enormous flowers, many measuring 6 inches in diameter.

The "GARDENERS' CHRONICLE" of October 1, 1881, says:—"From Heath & Son of the College Road Nurseries, Cheltenham, we have been favoured with a bloom of this noble Orchid, measuring 5½ inches across, from a new district in Northern Burma. The lip is 2 inches broad and the yellow blotch very bright."

The plants from this locality flower twice a year—in the autumn from the new growths, and in the spring from the old, with two to four spikes and from two to five flowers on a spike. The bulbs are very large and many measure 3 feet long.

Small plants, one and two breaks .. 60s. per dozen.

Small plants, three and four breaks.. 84s. ,,

Larger plants, six to eight breaks.. 100s. per dozen.

Few specimens and large masses .. 21s. to 63s. each.

HEATH & SON, EXOTIC NURSERIES, CHELTENHAM.

WM. CLIBRAN & SON,
THE OLD FIELD NURSERIES,
ALTRINCHAM.

8 miles from Manchester. Over 50 trains daily.

Inspection invited.

THE "AUTOMATON."

SIZES, 8 to 24 inches.

THE BEST GENERAL PURPOSE MACHINE.

The "AUTOMATON" Lawn Mowers are thoroughly strong, well-made, and durable machines, and the best suited for general work and *Gardener's* use. They cut the grass perfectly, leave no ruts, but produce a smooth velvety surface on the Lawn, and are light in draught.

The "AUTOMATONS" have front rollers for general work, and *side rollers* for cutting long grass, or when it is unnecessary to roll the grass in front of the cutters. They have the best machine made gearing, the best self-sharpening knives of steel and iron rolled together, and automatic silent drivers.

R. H. & J. also manufacture
"REVERSIBLE" Lawn Mowers for Small Gardens and Borders, and
"HORSE-POWER" Lawn Mowers for Large Lawns, &c.

THOUSANDS IN USE.
SENT CARRIAGE PAID.
MONTH'S TRIAL ALLOWED.
NO CHARGE FOR PACKING.

RANSOMES' LAWN MOWERS ARE THE BEST.

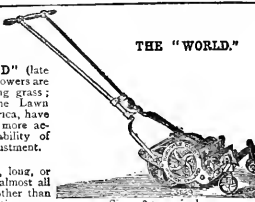

MELBOURNE EXHIBITION, 1881, THE HIGHEST AWARD.

COMPLETE PRICE LISTS FREE BY POST.

STOCK KEPT IN LONDON at Arch 92, Spitalfields Station. Bethnal Green, E., and Machines may be ordered from any respectable Ironmonger.

Ransomes, Head & Jefferies,
ORWELL WORKS, IPSWICH.

THE "WORLD."

SIZES, 8 to 24 inches.

FOR CUTTING LONG GRASS.

The "WORLD" (late "GLOBE") Lawn Mowers are intended for cutting long grass; and, whilst similar to the Lawn Mowers imported from America, have the special advantages of the more accurate fitting and general durability of English manufacture and perfect adjustment.

The "WORLDS" will cut wet, dry, long, or short grass without clogging, and cut off almost all the "beats." They leave the surface smoother than similar machines, and are well adapted for getting over a large amount of work with little labour.

THE "WORLD."

SIZES, 8 to 24 inches.

FOR CUTTING LONG GRASS.

NEW SINGLE DAHLIAS.

The grandest collection extant, including

ZIMAPANI—The Black Dahlia, and
JUAREZI—The Cactus Dahlia.

THE

Gardeners' Chronicle.

SATURDAY, APRIL 29, 1882.

CLAREMONT PARK,

THE home of their Royal Highnesses Prince Leopold (Duke of Albany) and his bride, the Princess Helena of Waldeck—of which, by Her Majesty's permission, we are enabled to give some account—is situated but a short drive from the village of Esher in Surrey, and about 14 miles from London. Esher stands upon rising ground on the Portsmouth road, and enjoys the reputation of having all the characteristics of a model English village. Claremont was a favourite Royal residence when Her Majesty was Princess Victoria, and no later than 1877 Her Majesty presented a drinking fountain of Aberdeen granite to the parish of Esher as a token of royal esteem and regard. The main entrance to the Park is near to Esher on the road to Leatherhead, where there is a handsome lodge at the entrance gates. The Park is about 35 miles in circumference; about 300 acres is enclosed by a ring fence, but the whole demesne, including the additions which have been made to the property, consists of about 1610 acres. Claremont has been known as one of the finest demesnes in Surrey since the time of Queen Anne. In her reign Sir John Vanbrugh, the architect, purchased some land at Esher and erected on it a small brick house for his own dwelling. This house, which occupied a low situation obscured from the many fine prospects which the place affords, was subsequently sold to Thomas Pelham Holles, Earl of Clare, afterwards Duke of Newcastle. He added a magnificent room for the entertainment of large companies when he was in administration, and greatly augmented the estate. He also erected a castellated prospect house in the Park, calling it after his own title, Claremont, which afterwards became the general name of the estate. During his Grace's occupancy the grounds were laid out under the direction of Kent, whose talents as a landscape gardener at that time attracted a good deal of attention. On a tablet is the following:—"Sir John Vanbrugh, Knight, owner of the estate, 1708, a dramatist, and an architect of celebrity. He built the first mansion, of which the gardens were laid out under Kent by order of Holles, Earl of Clare and Duke of Newcastle, Prime Minister to George II. and III., and bestowed on it the name of Claremont." The following lines from a poem by Sir Samuel Garth, a famous physician, will serve to illustrate the status of the great architect at that day:—

"But say, who shall attempt the adventurous part,
Where Nature borrows dress from Vanbrugh's art.
If, by Apollo taught, he touch the lyre,
Stones mount in columns, palaces aspire,
And rocks are animated by his fire.
'Tis he can paint in verse those rising hills,
Their gentle valleys, and their silver rills,
Close groves, and opening glades with verdure spread,
Flowers sighing sweets, and shrubs that balsams bleed.
With gay variety the prospect crown'd,
And all the bright horizon smiling round."

On the decease of the Duke of Newcastle in 1758 the title became extinct, his brother, the

Right Hon. Henry Pelham, of Esher Place, having died without male issue in 1754. This property was afterwards sold by the Duchess of Newcastle to the gallant Lord Clive, whose name is so intimately associated with British power in India. Whilst Claremont remained in his possession the grounds were remodeled, and a new mansion was built under the superintendence of Mr. Lancelot Brown, whose *soubriquet* of "Capability" Brown, is so well known to horticultural readers to this day. Brown is said to have been employed to execute the work without any limitation of expense, and to have performed his work satisfactorily at a cost of £100,000. Lord Clive died in 1774. Edward, his eldest son, afterwards Earl of Powis, was in his minority at the time of his father's death, and Claremont was disposed of to the Earl of Tyrconnell, who in 1807 resold the property to Charles Rose Ellis, Esq., who in 1816 conveyed the whole to the Commissioners of His Majesty's Woods and Forests under an Act of Parliament for providing a suitable residence for Her Royal Highness Princess Charlotte (the only daughter of the Prince Regent, afterwards George IV.), upon her marriage with Prince Leopold of Saxe-Coburg. The Princess died, under painful circumstances, at Claremont, November 6, 1817. The Prince became King of the Belgians in 1831, and left England. During His Majesty's absence Louis Philippe and Marie Amélie, King and Queen of the French, resided at Claremont, from 1846 to 1866, when His Majesty King Leopold died, and Queen Victoria became owner of the estate.

From the carriage drive beautiful views of the Park are obtained, the first attraction after entering the gates upon the Esher side being three large dome-like heights of luxuriant green, dotted with fine trees, which have a rich effect in the landscape. And upon the farm side of the Park stands out conspicuously an obelisk erected by the Duke of Newcastle during his residence here, surmounted by the Pelham crest—a peacock.

On nearing the mansion, leaving the gardens upon the right, the drive branches into two; the main one ascending the hill at the nearest point to the carriage front, while its tributary sweeps away in a southerly direction through a fertile valley for a considerable distance, and curves back to the east front. The mansion, as will be gathered from the foregoing remarks, has a commanding situation about the centre of the Park. It is said to be the only complete mansion that Brown ever built, though he is credited with altering many. It is an oblong building, built of brick, but the windows and dressings are of stone. On the eastern front is a stately portico of the Corinthian style, within the pediment of which is a large sculpture of the arms of Lord Clive. The saloon, or entrance hall, is approached by a flight of twenty-one steps, and ornamented with marble columns, and the walls are enriched by various devices to give relief. Besides the hall, which is of an oval form, and the great staircase, there are eight large rooms *en suite* on this floor. The library opens into the dining-room, in which there is a fine portrait of Queen Victoria by Winterhalter. The gallery is capacious, intended to have been fitted up with damask expressly chosen for it by the late Princess Charlotte. Here also are full-length portraits of Prince Leopold and Princess Charlotte by Dawe. The mansion also contains many other fine paintings.

The great staircase communicating with the apartments on the middle floor is ornamented with columns and pilasters of Sienna marble. On this floor is the suite of rooms occupied by Her Majesty when residing at Claremont. An immense Cedar at the north-east side of the building takes the reflecting mind back many centuries, and indeed several other fine trees in a group are not far behind this aged giant in size, although they do not possess the same

massive appearance at a distance. The remnant of two fine Acacias, still alive but much crippled, are not far distant from the large Cedar, which before the terrible snowstorms of 1880-81 was even more handsome than it is now.

Claremont is a veritable home for fine trees, specimens of which indicate that planting afresh may be undertaken with every prospect of success. Wellingtonias are among the finest in the country, and other coniferous plants grow with amazing vigour, and such colour, too! having that rich glaucous green and charming hues which are indicative of rare health and conditions of soil and climate suitable to the rapid growth and development of choice coniferous trees and shrubs. The deciduous element preponderates at Claremont, and flowering shrubs are comparatively absent, but no doubt these defects will be remedied now that the place is undergoing general repair. Our interest is, however, centred in the horticultural department; and now that the leaves are fallen, and one passes under the large canopies of leafless branches, which are no doubt delightful in summer, and do not lack interest now, still one cannot help almost regretting the absence of choice evergreen trees for winter effects where there is such abundant evidence that they would grow as freely as Willows by the water's edge. The Weeping Beech, and Birch, and Elm, the flowering Chestnut and Thorn, are charming in their season; but what of mid-winter, with its dismal associations, grim, dreary December, when Nature has, so to speak, gone to sleep for a time. It is then our parks and grounds are relieved of that monotony and sameness of appearance by striking a fair balance in the selection, planting, and disposition of ornamental trees and shrubs.

Upon the south front a new tennis lawn (sunk) has recently been made, the outline of which is formality itself, hardly in character with the undulating surfaces, natural or otherwise, by which it is surrounded. The slopes and surfaces, are, however, beautifully executed, and the lawn is in all other respects quite a success. The east side is adorned with one or two fine groups of evergreen shrubs, and a splendid sample of the Cork-tree, of which there is a representative bush upon the opposite side. The Park view from the tennis lawn is magnificent; the ground slopes gently southwards into a sweeping valley, clothed with rich verdure, and rendered further attractive by numerous fine specimens of Oaks, Chestnuts, and Beech, while a splendidly wooded country carries the eye for miles over the finest landscapes of which Surrey can boast. But the configuration of the lawn upon the west front is the most charming of all—the ideal lawn of the grounds, undulating in formation and pleasing to the eye. The walk from the steps in front of the mansion curves northwards, and is lost to view, approaching the extremity of the park upon this side among fine groups of trees and shrubs, and having the "Mount" previously alluded to as a south-western boundary. Access to the Mount is from the south-west angle of the mansion. It rises to a high elevation, and is surmounted, as before stated, by a castellated tower, called the Observatory. It is constructed with brick, in three storeys, with stone dressings. The Mount is literally embowered in trees and shrubs, and laced round by a pleasant path which affords refreshing shade in summer. It was on the slope of this Mount, under the shade of an aged Cork-tree, that Her Majesty and the late Prince Consort were accustomed to breakfast when at Claremont, while the younger members of the royal family disported themselves upon the greensward in front. From the top of the Observatory a commanding view of the surrounding country is obtained in the direction of Box Hill, near Dorking, near to which there are fine hills and woods; also to

Cobham, Walton, Weybridge, and the Crystal Palace. The grand stand at Epsom is quite visible to the naked eye from the carriage front, in which direction the Park presents a particularly interesting and varied appearance. But to proceed to the most delightful portion of the grounds, the route is taken by a long grass-walk from the Mount, going in a westerly direction. The walk is planted and overhung with fine Beech and other trees, and is margined by irregular spreading groups of the common ponticum *Rhododendron*: and this, we may say, is a very handsome and conspicuous feature over the entire grounds, or rather that portion of them representing woodland hills and dales intersected by walks, from which the green underwood has a cheerful appearance.

Mr. Grimm, the estate agent and manager, has lately effected great improvements by cutting down Laurels, *Rhododendrons*, &c., which have broken regularly into fresh growth, so that the woods are beginning to have an animated appearance, different from the smothered, crowded condition in which they must have been previously. Here are vacant spaces in plenty where choice Conifers would give a grand effect, and from the present wealth and variety of flowering shrubs what charming margins could be made to shrubberies, and groups introduced at certain points, which would transform the scene into a living fairyland. The eye grows weary of so much common Laurel, which is unsuited to a place which Nature has so bountifully enriched. Not a Snowdrop is to be seen in the woods, nor the sign of a hardy living flower; not a hardy Cyclamen, *Dafnoidil*, *Scilla*, *Crocus*, or anything in the shape of a hardy flower is there perceptible outside the garden walls. But the foundation is already laid for their reception; the ground is cleared of all worthless matter, and is clean, tidy, and generally in capital order.

A short distance from the Mount the Camellia-house is situated, at a fine elevation overlooking the lake—a charming sheet of clear water, over 5 acres in extent, and a valley richly diversified by trees and shrubs. Upon the opposite side of the lake is a fine group of trees, commonly known as the "Horse-shoe Clump." The lake is also bordered at certain points by healthy *Rhododendrons* which overhang its brink, and is further beautified by a collection of choice foreign birds.

The Camellia-house is a large, oblong, span-roofed structure in three divisions, the centre division being used for pot plants, and the walls are draped with creepers. The Camellias are planted out in pits, and most of them are very large healthy specimens, but somewhat behind the day in variety with one or two exceptions. Large amphitheatres of trees, woodland walks and valleys planted with common Laurels, are the chief attractions between the terrace in front of the Camellia-house and the Mausoleum at the north-western extremity of the grounds. This latter structure was originally designed by the Princess Charlotte for an alcove or open seat, but was converted by Prince Leopold at great expense into a mausoleum to her memory after her death. Descending the slope to the lake, and returning towards the house, several notable specimens of Beech, Chestnut, and other trees are observed, and not the least delightful part of the journey is that through which the visitor strolls—through narrow grass walks bordered by fine hedges of hybrid *Rhododendrons*, which luxuriate at Claremont, especially in the low-lying portion of the ground. A green plot is here and there visible with fine coniferous specimens in its centre, of *Taxodium* or Cedar, some of the former over 60 feet high. Standard Yews are also very fine, also *Abies canadensis* Wellingtonias, and others.

The entrance to the walled-in garden is upon the north-east side from Esher. The garden is divided into three divisions by two cross walls.

The first division is again divided by a wall covered with glass, nearly running diagonally, which leaves a triangle in grass in which shrubby beds are laid out and partly filled with American shrubs, such as Rhododendrons, Ghent Azaleas, &c. The other portion is cut up into grass plots with two ranges of glass about its centre, facing south-east. The houses are old, and as old-fashioned as they are old, and heated with flues. Vines are still grown, and bedding plants in sufficient numbers to

for another department. The third division is practically a flower garden, and a quarter for plant-houses only divided from the former by a brick wall covered with creepers. The flower garden contains a fountain surrounded with vases, and is further ornamented with a Rose trellis which is said to be very handsome in summer. *Benthamia fragifera* is conspicuous upon the walls; and altogether the future of Clarendon as a horticultural establishment may be looked forward to with hope and even con-

New Garden Plants.

EUADENIA EMINENS.

THIS very remarkable and beautiful Capparidaceous shrub was introduced from Western Tropical Africa by Mr. Bull, to whom we are indebted for the illustration (fig. 86). Sir Joseph Hooker, writing of it in the *Botanical Magazine*, t. 6578, comments upon its singularly handsome inflorescence, which resembles a candelabrum in its ramification, the yellow petals looking like pairs of gas-jets on each branch. It is a near ally of the common Caper bush, but is shrubby, with trifoliate leaves, the leaflets glabrous, dark green, oblong, lanceolate. The flowers are borne in loose terminal racemes, and are remarkable for their four very long, pale, sulphur-yellow petals, of which the two upper are very much larger than the other two, which by comparison are inconspicuous. Though so different, these petals remind one of the large coloured calyx-leaves of some of the *Mussaendas*. The figure here given, to the accuracy of which we can vouch, relieves us from the necessity of saying more of one of the most remarkable stove plants yet introduced. *M. T. M.*

CATLEYA WALLISII, Linden.

Reader asks: "You write on *Cattleya Wallisii*, are you sure you know it?" I say with emphasis, Yes, I am; I have the types kept in my herbarium, I nearly was its godfather, and I can tell the whole development of the appearance.

In the years between 1860-69 it was dangerous to come near Director Linden. After the usual introduction of conversation it was quite unavoidable to see him taking out of his coat the last Wallisian letter covered with a mosaic of partly abominable sketches, and Monsieur began a chat about the deciphering those hieroglyphs. At that time it was I who accused Wallis, whose neglect in sending good dried specimens I incriminated, when Mr. Linden defended his *royaume*. Later we exchanged our positions, but after all I said in Wallis' lifetime, that he might have been the most effectual contributor to Orchidology if he had liked to be.

Well, one of those days Director Linden showed me a certain sketch. It might represent a *Sobralia*, a *Cattleya*, a *Laelia*. "*Les fleurs est blanche!*" said Director Linden. "I do not know how it was the plant made its *ditto!*" as a *Laelia-Laelia Wallisii*.

Finally it flowered in 1869. The Lindenian monopoly proved to be a *Cattleya*, a fine thing of the section with the minute column *fièvre germain* of Eldorado. The first flowers are at my side this moment; fine white, with a transverse yellow rhombic dash on the lip.

I remember that one of the best and most celebrated English orchidists, a leading man, showed me a good plant of it, praising Mr. Linden for having sent the genuine treasure, tip-top. He knew the character, and he directed my attention to numerous mauve-purple blotches on the leaves.

Those blotches we know in many cases, alas! but if all were *Cattleya Wallisii* that show spots, now-a-days regarded a good testimony of the presence of thrips, there would be no lack of the plant.

Mr. F. Sandor has sent me several flowers of the plant, which are quite the same as the original, and I have written "Wallisii" and my name on the petal of a flower to give full evidence for the absolute identity of the two. The flowers are sent by one of the numerous Sanderian travellers. *H. G. Rehb. f.*

THIRIXSPERNUM BERKELEYI, n. sp.*

Leaves on a short stem, cuneate ligulate with two unequal teeth at the apex, the one, usually blunt, fine green, about 9 inches long. The raceme is pendulous, has a two-edged thachis and triangular very short and broad bracts. The flowers stand in three rows and are very conspicuous, neatly as much so as those of an

Thirixspernum Berkeleyi, n. sp.—*Caulescens dependens*: foliis cuneatis ligulatis apice bidentatis, dente altero nunc obtusato; nulli rescentia elongata polyantha pendula triseriali, thachis triquetra; bracteis triangularibus viscosis; bracteis speciosis, sepalo impari ovato acuto, sepalis lateralibus in pede columnae elongato oblongis apiculatis; tepalis oblongis apiculatis; labello limbo tridido, laciniis lateralibus linearibus apice cuneatis porrectis, lacina mediana carosa tridentata, dente medio prominente, dentibus lateralibus obscuris nunc oblitteratis, calcaris cylindraceo obtuso amplo anticeo curvato. Lind. ex E. Berkeley. (*Sarcophilus Berkeleyi*) *H. G. Rehb. f.*

FIG. 86.—EUADENIA EMINENS.

keep certain portions of the place gay in summer—a few flower borders and the flower garden proper. In this division there are fine Mulberry trees and a *Wellingtonia gigantea* having a spread of branches 23 yards in circumference, and a *Salisburia adiantifolia* over 50 feet high. Also an immense tree of *Pterocarya caucasica* with twelve or fourteen main limbs, any of which would make an ordinary sized specimen. The second division is simply cut in two by a main walk having borders planted with Conifers, which have long since overgrown the situation and are more suitable

confidence, for where such examples of trees and plants are to be found without the aid of a high-class professional there can be little doubt of what results will be under a modern system of cultivation.

GENISEA BRILCOX.—What Mr. Barron has growing on the rockwork at Chiswick under this name represents a very early-flowering hybrid Broom, raised by the late Mr. Wheeler, of Warminster, forming a compact bush, and densely covered with sulphur blossoms. It is a most conspicuous feature, and the eye fastens on it at a long distance. It is an object of great beauty, and its position elevated on the rockwork appears to suit it well.

Acerides falcatum (Larpenz) though the lip is shorter. The sepals and petals are very unequal, the lateral sepals the greatest, oblong apiculate. The lip has two linear side lacinia; curved at the apex, and a small three-toothed middle lacinia standing inferior. The lip goes out in a long cylindrical, blunt, somewhat antorse spur, nearly as long as the stalked ovary. The flower is of a fine white, called by some "Chinese white," and there are amethyst colour spots on the lacinia of the lip.

Taste is neither to be judged, nor to be directed. One should not try to have an influence on it. As to me, I love this chaste beauty, and he who likes an *Acerides* must become attached to this plant. It is quite new, as no one of the known *Thrixsperrum* (*Sarcophilus*) has such a rich inflorescence and such large flowers of such distinct colour. It was discovered lately by Colonel E. G. Berkeley during one of his trips made in the time of his holidays, and is devoted to this gallant orchidist with great attachment. *H. G. Kebb. f.*

*ANGRÆCUM DESCENDENS, n. sp.**

A curious fine *Angræcum*, much in the way of *Angræcum Ellisii* and *articulatum*. *Angræcum articulatum* is very easily distinguishable by its singular plump antorse spur and longer sepals and petals, and leaves which are much broader at the top. *Angræcum Ellisii* is much nearer. I believe, however, that the *A. descendens* is distinct in its stronger spur, less nerved petals, cuneate ovate acuminate lip, and in its much shorter hairy (?) column. My position is, however, a very weak one. Mr. Stuart Low, candid and open-minded as he is, sent me two further inflorescences, and they are so widely distinct one from another that one might hesitate when seeing them both aside. This one loses that confidence in the true development of the species. I have also to thank Mr. Low for a very fine plant, that gives me the impression as if it were shorter in growth and plumper than *A. Ellisii*. From a memorandum made of the Dayan type specimen, I see that the leaves of *A. Ellisii* have two strong blunt lobes at the apex. The *Angræcum descendens* has leaves with obtuse top lobes.

If our plant is genuine—all right. If it proves a sport, I have little doubt it is a larval state of *Angræcum Ellisii*, which lost its temper from travelling, or who knows what other cause. Hence, my view is that orchidists, if they have been deceived, are so for the better. *H. G. Kebb. f.*

ODONTOGLOSSUM LIGULARE, n. hybr. (?)

This is an unusually fine thing which I name with great reluctance, as is usually the case in those supposed *Orchid* hybrids, which may at least in some cases finally turn out merely aberrant varieties. One is never sure of disagreeable coming surprises. *Post equitem scilicet astra cava.*

I have at hand a herbarium packet, three times as high as my thumb's latitude, containing perhaps a thousand (!) flowers of twenty-five forms believed to be males arranged in eight groups. How could I have named this one for Mr. Veitch? Had I said "Coradinei" Mr. Harry would have reproached me, and he might have been right, though he is particular as to Coradinei. To begin with, the sepals and petals are nearly orange, each with two or three great brown blotches. The lip is unusually broad. It has an orange unguis and a great hastate ligulate blunt blade, with numerous small denticulations on the border. This blade is lighter yellow than its stalk, and nearly the whole of its disc is covered by a large dark brown blotch, and there is one small brown blotch over it on each side. The two keels are small, rhomboid, two-toothed. A few small antorse subulate short keels stand in one transverse row before the beginning of the stalk at the base of the blade. The column is whitish, with short rhomboid terminal wings, which are totally distinct from any of the very numerous, sometimes much varying, Coradinei I had. The lip is quite free.

I obtained this fine thing, first a fresh flower, then the inflorescence (of the entire plant I know nothing), from the collection of Sir N. M. de Rothschild, Bart., Tring Park. *H. G. Kebb. f.*

PHAIUS BLUMEI (Lindl.) ASSAMICUS, n. var.

I possess the *Phaius Blumei*, Lindl., founded on *Blumei* the *Lindodorum Incartvillei*, Bl., from Blume

Angræcum descendens, n. sp.—Caulis: foliis oblongo-linearibus, mucro-nibus, lobis, supra siphonibus: racemo elongato, plumb. rot. annulato ovario pedicellato bractea multiformi superius: sepalis triangularibus: petalis sub angustibus, illis

himself, and the representation given by Dr. Vriese quite coincides with what I have. The drawings published later by Blume in the last work are distinct in their shorter spur, and are nearly identical with *Phaius Blumei Bernaysii*, Rehb. f., excepting in colour. What I saw from Java were usually triandrous, sometimes diandrous, or nearly pentandrous, never monandrous.

There is a plant from Assam (Griffith! Staur!) and Birmah (Griffith! Rev. C. S. P. Parish!), that I cannot distinguish from this, but which is always monandrous. I propose to call it *assamicus*. Philosphers may teach us whether this be the type or the Javanese one. To me this is wholly indifferent, as there are numerous cases where such developments ascend, and others when they descend to the original state. This *Phaius Blumei assamicus* is one of the most variable *Orchids* as to colours I know of, though apparently not comparable to the unlucky *Odontoglossum crispum*.

Phaius Blumei assamicus luteo-albus (fourteen syllables! *ca commence!*) has yellowish flowers, with a light yellow lip bordered with white. It is the cousin of *Phaius Blumei Bernaysii*. It flowered in April, 1879, with Mr. W. Bull, and is now at hand from Mr. Veitch from Birmah, and Mr. Bull received it from Assam.

Another, *purpuratus*, flowered July, 1875, with Messrs. Veitch (November 29). It is a very fine thing, flowers deep rich yellow, lip orange bordered with good purple, petals brown with yellow middle lines, sepals brown inside.

The third, *picturatus*, flowered May, 1879, with Mr. Bull. It is quite striking. Flowers pale yellow; base of the side lacinia of the lip mauve with purple stripes; edges light purple with dark purple stripes; remainder of the lip fine yellow.

Finally, *oculatus* has sepals and petals brown inside. The lip is yellow, and each lateral lobe has a purple blotch on its disc. It was sent, March, 1881, by Herr Ritter. All those specimens and numerous complete sketches in colours at hand. *H. G. Kebb. f.*

CHARLES DARWIN.

PLEASE permit a practical gardener to lay a wreath on the bier of our great teacher. It is impossible for me to express my full indebtedness to him. I had hoped to discharge some of the debt in a paper on *Pangensis* but I had intended to read some years ago at Nottingham; but now he is gone one can hardly keep silence, though I have little or nothing to add to what you so well said last week on the character of the man, his mode of working, the extent of his researches, and the extreme value of his labours; but you cannot so well estimate what mental quickening and pleasure Darwin brought to hundreds—probably thousands—of all but unknown practical horticulturists. His facts, so carefully collated, so powerfully marshalled, brought new light, fresh inspirations, a higher intellectual life to myriads of plodding workers in the field of horticulture. Often because of the hardness of the labour, work and thought have been too much divorced. Darwin, as it were, thought on our behalf, and placed his thoughts before us buttressed up with such an array of clear concrete facts that we could not fail to appreciate his thoughts through his facts; or, if we did so fail, yet were we all the richer by the number and value of his facts.

It is astonishing how much one hears in general society of Darwin's theories and how little of his facts. I do not know how it may have struck other students of his works, but I have been amazed at his reverent timidity in heaping up fact upon fact until they seemed piled to a mountain height, and all pointing to one conclusion; and then, instead of anything like dogmatic conclusions or assumptions, merely a mild supposition, or "may be so." Would that we could imitate our great teacher in the strength of our facts and the timidity of our conclusions therefrom. The facts brought together in the two volumes, *The Variation of Plants and Animals Under Domestication*, and his wonderful work on the *Fertilisation of Orchids*, may be looked upon as an encyclopaedia for practical horticulturists, and they are collected from all sources, and appear to have been also retested by personal experiment before receiving currency from Mr. Darwin. No one who has not read these works carefully, as well as the *Origin of Species* and the

apicem versus extus carinatis apicibus apiculatis, labello oblongo acuto, calcaribus ovario pedicellato ultra quater longiore, anthe novo Emato: columnae brevioris crassa velum, anthera apiculata. *H. G. Kebb. f.*

other works and papers of the author, can form any idea of the immensity of the labour that they involved. Of the results of his labours to practical horticulture it is almost as yet too early to write. You appear to me to form a very moderate estimate of their practical value, and it will not be until the major portion of Darwin's facts are known and thoroughly understood, and their far-reaching results grasped by practical horticulturists, that the richer fruits of his labours will begin to appear.

For not only are Darwin's facts valuable in themselves, but most of them are like living seeds and will originate species, genera, varieties of similar or correlative facts; and this horticultural knowledge will root deeper, spread wider and rise higher, and its practice also be improved through all coming ages by the labour and example of Charles Darwin, for not only the work done but the manner of doing it are invaluable.

One trait in his character that endeared him to many of us must not go unnoticed. No practical man, however humble his station, that had a fact to record was considered unworthy of his notice or a note of thanks. He also seemed to have scanned our horticultural literature with an eagle eye, and to have gleaned from thence all the facts that served to illustrate his point or bore upon his purpose, verifying his extracts with references.

In losing Darwin few among us but feel we have lost a friend as well as a great teacher. No man has done more to raise horticulture than he who has laid in his right place in the Great Abbey. His friends may be assured that he lives in the hearts of many among us, and being dead he will yet speak to us through his marvellous works, which have done so much and will yet do more to raise the science and practice of horticulture, as well as botany, to a higher, broader, nobler level than either of them has ever reached heretofore. *D. T. Fish.*

RHODODENDRONS NEAR SWANSEA.

MAY and June are usually reckoned the blooming months of the hardy *Rhododendron*, and inasmuch as the bloom cannot be extended beyond the beginning of July I wish to draw attention to the comparative hardness of some of the species and so-called species, from the Sikkim Himalayas, which, blooming in February, March, and April, help us to claim five months during which the lovers of this noble genus can enjoy its varied magnificence. It must be borne in mind I am now speaking of plants wholly unprotected save by Nature. The restriction of success appears to exist not so much in the climate as in the soil; the presence of lime or chalk seems to be fatal, and beds in such a geological formation, even though carefully prepared and periodically replenished, are an expensive substitute for what in congenial soils requires little attention and care. Peat is here unnecessary; they thrive in any loam, so long as the poisonous lime is absent; and they require no special care beyond a watch to see that the stocks on which most bought specimens are worked are not sending up robbers or suckers from the root, while should the plants be seedlings or layers even this is not necessary.

If the plants thrive in a congenial soil, so as really to ripen their wood before the autumn, it does not appear that a few degrees more or less of frost in the succeeding winter will injure them. The frosts of 1879-80 and of 1880-81 were very intense, the thermometer going down nearly to zero, and the frost being on one occasion accompanied by a howling easterly gale which will be remembered by most: yet the plants I shall enumerate have withstood them as thoroughly, and have bloomed since as well, as the ponticum and *Catawbiense* in this part of South Wales, where a moist cold has often injured plants which have stood the drier cold of other parts of England.

No doubt a spring frost—such as we are always liable to in February, March, and April, and even sometimes in May—may cut away the early blooms, but others succeed, and the leaf shoots will here push on with all the greater vigour to produce a next year's flower-bud. I have often admired the way in which Nature seems to accommodate herself to circumstances in taking advantage of the finer spells of weather in the spring, hanging back and refusing to expand her trusses of early *Rhododendrons* before impending periods of chill.

The first to appear is arborcum and some of its hybrids, such as Nobleanum, blooming at Christmas and in January, and which in such open seasons as we have experienced this past winter are very well worth having. The trees seem uninjured by frost, but it is only in exceptionally open years like this that much satisfaction can be obtained from their bloom.

Commencing then in February and through March comes *R. barbatum*, figured in Sir Joseph Hooker's work on *The Rhododendrons of Sikkim Himalaya*, a species not sufficiently credited with hardiness, but which is without doubt a truly hardy and satisfactory species here. The plant may at any time be recognised by the peculiar bristles which adorn the petiole of each leaf, which is lanceolate, and not adorned with that distinct colour on its under-side which renders several other species so attractive, whether in or out of bloom. The bark is smooth and polished, and of a bright purplish tint. The trusses consist of a number of blood-red bells, and are freely produced on trees of a certain age, and as at Singleton Abbey there are some twenty or twenty-five plants, which annually bloom with great freedom, it has undergone a very satisfactory apprenticeship down here.

Following this comes *Rhododendron Thomsoni*, resembling *barbatum* in tone of colour, with a looser truss, and larger individual blossoms, following *barbatum* in point of time, and quite distinct in its neat cordate foliage. This species sheds its foliage annually in October, the old leaves turning golden before being shed; but as the young fronds have already set, it retains its evergreen character. It is a free-flowering species, and an especial favourite of mine, the black spots in the interior of the corolla setting off each of the fine waxy blood-red bells, with their peculiar neat little settling of leaves, in a very fascinating manner. A plant at Singleton has this year produced about 500 trusses.

At this same time, too, comes *R. ciliatum*, dwarfier, and very floriferous, whitish, tinted with lilac, and sweet-scented. The smallest plants seem prone and even anxious to bloom, and from its neat compact habit it is invaluable as a foreground plant.

R. campanulatum also blooms in March and April, though the species is at any time worth growing for its strikingly beautiful foliage; dark green above, it is beneath of a rich brick-red hue, which contrasts strongly, and is a very welcome addition to the few points of interest found throughout the winter. The figures of this species in the *Botanical Magazine*, No. 3759, and of *Wallichii*, show that it is variable, but it is none the less useful, and I strongly recommend it. This campanulate is the evident progenitor of some remarkable hybrids at Singleton, which must be seen to be appreciated; but I am constrained to attempt a description of one which, alas I was broken in last October's disastrous gale, but of which I possess a photograph. The bloom-truss combines three essential qualifications:—1. The truss is well and conically set up. 2. Each pip is of a well-shaped campanulate bell. 3. Each pip is of a pure white, very richly spotted with a dark purple blotch, and constitutes, in my humble judgment, the finest and one of the most constant hardy hybrids I have ever seen. The bloom time is Easter, and as it continues for some weeks at Easter an abundance of trusses can be cut for church decoration; and need I say that it has year after year been laid under heavy contribution at a time when such flowers are in such special request. Being informed that as many as 200 trusses had been cut off for Easter Sunday from this one plant without their being missed, I made it my business last year to test this statement by attempting to reckon the total number of them, and I found upwards of 1100. Strict accuracy was out of the question, but I think there were fully 1200, the height of the plant being about 20 feet, well furnished and bloomed.

But, to go back to the species, it is not alone for their bloom the species of *Rhododendrons* are worth growing. The foliage of some is most striking and grand, and cannot fail to attract the attention and admiration of the beholder.

Here at Singleton *Rhododendron Falconeri* grows to a height of 18 feet, and is nearly as much through; the individual leaves are 18 inches in length by 7 inches wide; dark glaucous green above, and thickly coated beneath with a soft ferruginous woolly tomentum, which adds marvellously to their peculiar and striking beauty. The bloom is a straggling and somewhat awkward loose collection of white, bell-shaped blossoms, and has been hitherto sparingly

produced; but the great attraction of this noble species lies in its leaves, which undoubtedly constitutes it the finest outdoor hardy foliage plant I have seen in Great Britain.

Next to *R. Falconeri*, in its striking foliage and with a finer inflorescence, comes what is supposed to be *R. eximium*, a species not figured in Hooker's *Rhododendrons of the Sikkim Himalaya* or in the *Botanical Magazine*. The plants at Singleton are 18 to 20 feet high, well furnished throughout. Two are now blooming, one having fourteen trusses, and the other six, which are individually of commanding size and appearance, consisting as they do of forty or more pips, each 2 inches at least in diameter. The shape of the flower is an open bell and the colour a pale purple, opening much darker, and dying off very much paler than the typical colour at mid-season. The individual leaves are not quite so large as those of *R. Falconeri*, and differ from them chiefly in the tomentum on the inferior side of the leaves being less richly coloured; yet some of the leaves, out of reach of measurement—some 20 feet from the ground, where the plant seems to have luxuriated in the fostering shelter of a large overspreading *Pinus excelsa*—cannot be much smaller than those on the adjacent *Falconeri*.

What is *R. eximium*? I have small plants from Van Houtte under this name, and they agree with the old plants at Singleton in foliage, and it is under this name the plants I have described are grown. The bloom is like the *R. Hodgsoni* of Hooker's book, but then the foliage disagrees; and besides this there is another plant, as yet unbloomed, whose foliage resembles the *Hodgsoni* plate and description, and is quite distinct apparently from *eximium*.

Another distinct species with peculiar leaf and purple bloom is *R. niveum*, also an April bloomer.

An old plant of *R. arborcum* album, *Bot. Mag.*, 3299, relieved from a surrounding tangle of common ponicum, has gratefully rewarded me with its nearly pure white handsome trusses this April; and *R. cinamomeum* and *R. ochraceum*—both varieties, I think, of *arborcum*—the former pale pink, the latter white, have bloomed at the same time.

R. fulgens is another of the dark reds. I have not seen it as fine as *R. Thomsoni*, but it seems quite hardy.

R. nilagiricum has not bloomed, though the tree is an old one.

In addition to these some small plants of Campbelli and of Massangei have stood the frosts satisfactorily, and will, I hope, prove quite hardy.

R. argenteum has been injured but not killed, and I hope will recover.

R. glaucum is a pretty dwarf little species with a peculiar aromatic smell, very floriferous, quite hardy, and useful as a foreground plant.

R. ferrugineum (the *Rose des Alpes*) and its hybrids is subject to the attacks of rabbits—unlike in this respect to other species, as well as *Azaleas*, which rabbits do not touch.

R. Edgeworthii and *R. Sestierianum* were grown out-of-doors and bloomed with some freedom at Singleton for some years, but the winter appeared to injure them and the plants were therefore brought into the conservatory, where they now flourish.

R. Dalhousie, too, grew out-of-doors, but the bitter winter of 1879-80 killed it, and it was this loss that induced the watchful eye of Mr. Harris, the careful and clever head gardener in charge of these lovely gardens, to move the above-named *R. Edgeworthii* and *R. Sestierianum* into the protected quarters, where they are now (April 22) in full luxuriance of their bloom.

R. Macnabi, however—which is, I believe, a hybrid of *R. Edgeworthii*—is flourishing, and blooming freely by the side of *R. Falconeri* in the open ground. These plants were raised from seed given to Mrs. Vivian by Lord Dalhousie and Mr. Edgeworth (after whom two of the noblest species are respectively named) and Col. Sykes, about the year 1846, on the occasion of a visit paid by them to Singleton. What other species may have been reared from this seed and succumbed to the severities of the winters since then I do not know. I only know that those plants now growing are the very picture of robust and luxuriant health, and having withstood two winters of intense severity without injury, are practically safe; and as years advance the trees have become more and more injured to our uncertain climate, and have borne seed, some of which, by Mrs. Vivian's kindness, I am rearing, and which ought to produce

a race at least equal to their parents (more I cannot expect) in hardiness.

There is one point I must name to deprecate—that is, the naming of hybrids with a *quasi* specific appellation. Thomson I know, and Hodgson I know, but who is Jackson? I should have looked for a congener worthy of such a fraternity, but lo! a hybrid. It is a misuse of a botanical privilege to latinise a trivial name into a botanical name—mistaking and mischievous. I do not see the least object to hybridisation itself: who that has seen the brilliant results obtained by those exhibitors who will shortly be delighting the public with their May and June flowering sorts can do so? I only ask for a prolongation of the season, and I have been struck by the apparent absence of the blood of my favourite Thomson, which I should have expected to have proved a most useful ally. Ascot Brilliant is the only one I can now recall which seems undoubtedly to show their parentage.

I cannot close this without a word of recognition of the pride and care with which the plants are tended by Mr. Harris, the intelligent and able gardener who has charge of them, and of the interest taken in them by the venerable lady to whom they belong; and I can only wish they may both live long to continue the enjoyment of plants which, alas! are as scarce as they are beautiful.

A writer in the *Garden*, of last autumn, tells us of species he finds hardy in Southern Ireland, beyond those plants of which I now write. I know few in South Wales, but surely in Ireland or Devonshire, or Cornwall, an experience has been gained of some of these species which would be very acceptable in your columns. *John T. D. Llewellyn, Penllergare, Swansea.*

NOTES ON PERENNIALS.

The following perennials were sown in a frame on a slight hot-bed on March 9, 1881, and bloomed the first season—i.e., during the summer of 1881:—

Cedronella cana.—Pretty, and very fragrant; useful for putting into claret-cup.

Coreopsis grandiflora.

Corethrogyne spathulata.—Free-blooming, and flowered pretty early, but not very showy. Daisy-like flowers, white, tinted with lilac.

Dahlia variabilis and *D. gracilis*.—Single varieties. Made a fine show in the autumn.

Delphinium nudicaule and *D. sinense*.

Erythronium ranunculifolium.—A neat Violet-like plant.

Fragaria indica.—A Strawberry with yellow flowers.

Grindelia hirsutula.—A rather showy yellow Composite.

Helianthemum grandiflorum.—A very effective plant, the yellow rays being set off by the black disc.

Heris glaberrima hybrida.—Very good. Flowers almost as large as the type, and habit much better. White, tinted with lilac.

Linaria trioranthophora.—Variable in colour. Flowers rather large, and produced abundantly.

Linum flavum (?).—Very showy. I question whether this is not *L. arborcum*.

Lychnis Hargreavei, *hybr.*, and *L. Seano*.—Both very pretty, and came early into flower.

Nicotiana glauca.—Very neat.

Papaver alpinum.—This is a charming yellow Poppy; but wherein does it differ from *croceum* or *nudicaule*?

Pentstemon centralifolius.—Bright scarlet, rather small, and partially closed flowers. Habit of *P. Murrayanus*, i.e., rather leggy.

Pentstemon pubescens, or (?) *lotus*.—Neat habit and free blooming, with rather pretty lilac-blue and white flowers. One of the hardiest of the genus.

Pyrola rotundifolia var.

Ranabackia fulgidula.—Flowers rather small for the genus; in the rays petals want length.

Saxifraga Beckeri.—Not very showy.

Sibthorpia purpurea.—This bloomed freely, but it is more curious than pretty. The flowers are dull in colour, and ragged in form.

In all, out of fifty-seven species of reputed perennials raised from seed, thirty-one bloomed the first summer. Many of these have perished even in the past mild winter, when the lowest temperature has been 29° 5, so that the advantage of sowing early and seeing at once what the plants are like (in the case of species new to the grower) is apparent. On the other hand, it is probable that plants that flower the first summer are less able to stand the winter than those that have not done so. *Alfred O. Walker, Chester.*

THE HISTORY OF THE AURICULA.

ON the occasion of the exhibition of the National Auricula Society at South Kensington, April 25, a lecture on the "Early History of the Auricula" was given by Mr. Shirley Hibberd, of which the following is an abstract:—

In this eventful history the endeavour to begin at the beginning is likely to be frustrated by the meagreness and vagueness of the facts. Many observant florists have speculated on the origin of the Auricula, and have scarcely as yet arrived at satisfactory conclusions. In the delightful discourse by the Rev. F. D. Horner in this place, on April 19 last year, several species of Primula were named as likely progenitors of this remarkable flower, but I must confess I have not been able to satisfy my mind in respect to more than two or three of them. Those that appear to have the largest claims are *Primula auricula*, *P. hortensis*, and *P. ciliata*. Possibly *P. amena* may have some claim, and it would be convenient to regard it so because of its purple colour. But although we thus obtain four names we have in reality only two species, for *hortensis* and *ciliata* are but varieties of *Auricula*, and *amena* comes too near to the common Primrose to be classed with the ancestry of our exhibition favourite. Mr. Darwin, in his *Forms of Flowers* (p. 43), declares, on the authority of Kerner, that "the garden Auriculas are descended from *P. pubescens* (Jacq.), which is a hybrid between the true *P. auricula* and *P. hirsuta*. This hybrid," he continues, "has now been propagated for about 300 years, and produces, when legitimately fertilised, a large number of seeds." [See *Gard. Chron.* 1875, vol. iv., p. 806.] But in this supposed pedigree we have the making, at the utmost, of an alpine Auricula, and in *Primula villosa*, which I take to be the same as *pubescens*, we seem often to have the alpine Auricula ready made, as, for example, in the plant figured in the *Botanical Magazine*, t. 14. The Hon. W. Herbert, in *Horticultural Transactions*, iv., 20, gives reasons for regarding *P. auricula*, *P. helvetica*, *P. nivalis*, and *P. viscosa* as varieties of the same species. One of his reasons is that he raised a powdered Auricula and a *P. helvetica* from the seed of *P. nivalis*. But a powdered Auricula is not enough for our purpose; we want an edged Auricula. However, the raising of an Auricula of any kind from the species named is a fact of great importance, and suggests a more Darwinian view of the case than the one Mr. Darwin himself adopted. It certainly takes us, on the basis of experiment, back to the variable *P. auricula*, and for other blood we seem to search in vain. Therefore, if we are bound to begin with a plain-able beginning, we must take the wild Auricula as the sole basis of this department of floriculture, and pronounce the current opinion to have many claims on our acceptance as at once philosophical and historical. The wild Auricula is very widely distributed on the Carpathians, the lower ranges of the Alps, the higher ranges of the Black Forest, and on the northern slopes of the Caucasian range. In places where a scattering of fertile soil on stony declivities favours its growth it is met with in thousands; it is, in fact, more abundant in certain localities than is the common Primrose in some of our own western valleys. The interest of the inquiry all turns upon the apparent impossibility of deriving from this humble flower of a pale yellow colour the variety and the exceeding beauty of the flowers that are cherished by the florists for their sharply-defined edges, their rich body colours, their pure paste, and brilliant centres that are like perforated nuggets of the purest gold. But I shall ask you to believe that the flowers we find especial delight in to-day are the true descendants of *Primula auricula*, without admixture of blood from any other source whatever. Our common Primrose is a sportive beauty that is now yellow, now white, and anon purple, crimson, and amethyst, and in form single, double, and hose-in-hose. And it happens too that the wild Auricula sports without man's aid into red and purple, and thus provides us with some of the colours ready made for working up into the glorious edged flowers that now afford us so much pleasure, mingled with surprise. But although the plant ranges far and varies much, and is often so abundant as to pave with a solid floor of its own lovely herbage the meadow levels and sunny slopes of the mountain ranges of central Europe, there is no

record of the faintest hint of an edged flower having been discovered in any of the wild forms. And thus the Auricula of the florist comes before us as peculiarly and pre-eminently the production of the florist; he has discovered how to develop its capabilities of varying in colour, and more especially how to augment and redistribute the fauna or meal which Nature has provided for the defence of the plant in the oftentimes trying circumstances of its wild life on the mountains. The richness and precision of the body colour, whatever it may be, has less interest from a scientific point of view than the distribution of the meal, which in the wild plant is only found sparingly on the leaves and in the centre of the flower, whereas in some of the florists' varieties the leaves are as white as wool, and the paste in the flower is as dense as the ice on a bride-cake, though infinitely purer in quality.

This change, so marvellously distinct, and so full of fine floral character, has been accomplished in so short a space of time that the truth is hard to believe. The Auricula is literally a flower of yesterday, and there is nothing worth searching for in the old books to throw light on its history. The grower of Carnations and Tulips may find a feast prepared for him in the books that take us far back in the annals of floriculture, but although on the mountains the Auricula has been blooming beautifully since the third day of the creation, it makes but little show on the heights of horticultural literature. We may assume it was not known at Antwerp or Leyden in the middle of the sixteenth century, for had it been it must have obtained the notice of Kembert Dodocens, who commenced publishing in 1552, and in none of his works has he mentioned it. In his *History of Plants* he describes a few "Petie mulleyns" or "Pisme Roses," including the common Primrose, the Oxlip, and the Cowslip, and speaks of divers kinds "single and double," but there is no hint of the flower before us. We have, however, the important information that in his time the Primroses, and Oxslips, and Cowslips were "used daily amongst other pot herbs," a statement suggestive of extreme poverty in the kitchen garden.

Gerard and Parkinson are necessarily quoted by writers on this subject, but they give us far less help than they have had credit for; however, one must excuse them if they do not describe a flower that in their day had no existence. Gerard appears to have had two or three Auriculas of the class now known to us as alpinas, with yellow, red, and purple flowers. He indeed in the *Herbal* in 1597 describes, at p. 640, eight sorts of mountain Cowslips, or Bear's-ears, as they were then called, but three at least of the number are not Auriculas, and of the remaining five one is doubtful. In Johnson's edition of Gerard, published in 1633, the story and the picture differ but little from the original work, but a note is added at p. 785 to the following effect:—"There are divers varieties of these flowers, and the chief differences arise, either from the leaves or flowers, which are either smooth or greene, or else grey and hoary, againe they are smooth about the edges, or snipt more or lesse. The flowers some are fairer then othersome, and their colours are so various that it is hard to finde words to express them, but they may be refer'd to whites, reds, yellowes, and purples; for of all the varieties and mixtures of these they chiefly consist. The gardens of Mr. Tralescant and Mr. Tuggie are at this present furnished with great varieties of these flowers." The great John Parkinson, of blessed memory, publishing in the year 1629, which for our present purpose may be regarded as strictly synchronous with Johnson, describes twenty-one sorts of Auricula ursi, or "Beares-Ears," and we seem to be getting warm when in a receptive state of mind we turn over pp. 235-246. But criticism founded on knowledge will quickly reduce the twenty-one to a smaller number, and at the very best there is not an edged flower, and perhaps not a proper self, amongst them. Of the eight varieties figured by Parkinson on p. 237 two are not Auriculas, and the remaining four differ but little in their characters, and we really cannot say that the history of the flower begins there.

In Mr. Horner's lecture mention is made of the Flemish weavers who settled in Norwich, Ipswich, Rochdale, and Middleton, about the year 1570, and who brought with them Tulips and Auriculas from their cherished gardens of the Netherlands. But the Auriculas of that time did in no way represent the Auriculas of this time; for in 1570, and for

many years thereafter, the edged Auricula was a thing unknown.

In the second edition of Philip Miller's renowned Dictionary, published in 1733, we are told that "to enumerate the diversities of this plant would be almost endless and impossible, for every year produces vast quantities of new flowers, differing in shape, size, or colour." And he proceeds to give a table of characters, five in number, from which we may infer that at that date the edged flower was unknown, and from which we may learn that if known, it was certainly not regarded as of any special value. The characters as given by Miller may be thus summed up: "The flowers must be borne on a strong stem; they must be in a regular and close umbel; the neck of each flower should be short, and the face flat and not inclined to cup; the colours bright and well mixed; eye large, round, of a good white or yellow." In the sixth edition, published in 1771, these characters are repeated. I turn from Miller's Dictionary to the *Eden* of Dr. John Hill, a handsome folio, published in 1757, and therein we hear of yellow and purple Auriculas, but not of edged flowers and not of named flowers of any kind whatever. The Rev. William Hanbury's *Body of Gardening*, in two fine folio volumes, 1770, tells of varieties "almost infinite in number" of this "luscious flower," but there is no hint even here of a proper Auricula; we are still rioting amongst alpinas and border flowers, double and single, but the tone of the writer does suggest that in 1770 it had long since passed into the hands of the florists for weal or woe. We learn from Hanbury that the florists rejected the double flowers and made a broad distinction between the self-coloured and the variegated, and at that point Mr. Hanbury leaves us to our own conjectures.

Thus we began with the third day of creation, and we have nearly reached the close of the eighteenth century, and we have not heard of any such Auriculas as have brought us together to-day. It will be seen, however, that Hanbury affords a clue to the time of their first appearance, which was doubtless about the middle of the eighteenth century; and we may reasonably conclude that for some time after the flower acquired the characters for which it is now valued writers on horticulture were in some instances unaware of its existence and in others were prejudiced against it. Indeed, Mr. Hanbury was evidently familiar with the characteristics of the Auricula "fancy," and seems to have set up his back at it because of his confessed partiality for double flowers.

We have, however, a somewhat remarkable proof of the comparative lateness of the formation and acceptance of edged flowers in a paper published in the *Florist* in the year 1849. This professes to be a copy of a manuscript dated 1732, and bears all the needful evidences of genuineness. In this document we have a table of properties, twelve in number, from which we gather that the tips should be round and flat, the body colour solid, flaked, or striped; the bottom circular and without powder, and the eye showing a full thrum. Whatever may be the exact meaning of the terms employed in this code—and we should probably have but little trouble to master it in every detail—it seems to demonstrate that whoever drew it up was a thorough florist, but had never seen, or at all events had never recognised as proper, an edged flower of the modern type.

However, Mr. John Slater, in the *Amateur Florist's Guide*, published at Manchester some ten years since, gives a list of edged flowers that were in cultivation in 1776, some of which no doubt were known in 1750, which, for present purposes, I will assume to be the year in which the Auricula first acquired its proper form as a florist's flower. Mr. Slater has searched the records of the cultivators of Middleton and Rochdale, and other of the ancient homes of floriculture, and he makes a distinct declaration at p. 18 of his book that the oldest known varieties were Rule Arbitr, with a green-edge, and Hortaine, with a white-edge, and these, he says, can be traced as far back as 1757. Potts' Eclipse, a green-edge, he traces to the year 1707. About the year 1785 several sorts that are now known were introduced, such as Grimes' Privater, grey-edge; Popplewell's Conqueror, white-edge; Gorton's Champion, green-edge; and Wrigley's Northern Hero, green-edge. Thus the negative evidence derived from our exploration of the old books agrees with the positive evidence derived from the modern books, and we may safely regard the Auricula as dating from 1750, and it is therefore as a florist's flower a quite modern achievement. The first

table of properties appears to have been published by James Thompson, a florist of Newcastle, in the year 1757. Maddock published his table of properties in the *Florists' Directory* in the year 1792, and Emmer-ton improved thereon in his *Treatise on the Auricula*, published in 1815. Hence in Martin's edition of Miller, published in 1807, the edged flowers are recog-

the present time possesses or desires so many; for the annual exhibitions tend to the weeding out of the inferior kinds, and the maintenance of a high standard of merit. And this standard of merit, usually described as arbitrary, is in the main in strict accordance with the laws of Nature. The stout smooth pip, the pure colours, the rich bold thrum-eye, the ample

special attention to this flower, the origin of which dates back only 130 years. It may be properly described as the creation of the florist, and it suggests a very interesting consideration as to the future of life on this planet. It cannot be doubted that Nature employs man as a species-maker, and he is ever busy in modelling new types,

FIG. 87.—MEDINILLA AMABILIS. (SEE P. 572.)

nised, and their properties stated on the authority of Maddock, and agree pretty nearly with the properties required in the present day.

Thus we arrive at a distinct epoch in the history of the flower, and the early history is completed. I shall scarcely err in saying that it is at this time in high favour, well understood, and its quality justifies the century and a half of labour that has been bestowed upon it. We may hear of collections numbering 400 to 500 varieties, but probably no one at

healthy leafage, are several signs of vigour and power of reproduction, and claim a forward place for the plant in the "struggle for life," which tends ever to the "survival of the fittest." It is interesting to see the evolutionist and the florist walking side by side, the one speculating on what Nature might accomplish under certain circumstances, the other demonstrating her capabilities by the exercise of his taste and the work of his hands.

The evolutionists may be invited to give some

for his own delight as he thinks, but really and inevitably for the determination of the forms of future life on this planet. He has already made the world in a great degree conformable to his own idea; in other words, he has modified the face of Nature for the gratification of his tastes and appetites, and he will continue with ever-augmenting power to extinguish races and create races, and in various other ways comply with the destiny declared for him in the 28th verse of the first book of Moses, called Genesis:

"And God blessed them, and God said unto them, Be fruitful and multiply, and replenish the earth, and subdue it: and have dominion over the fish of the sea, and over the fowl of the air, and over every living thing that moveth upon the earth."

Orchid Notes and Gleanings.

MR. BOCKETT'S ORCHIDS.—Results in the cultivation of Orchids are almost invariably somewhat different to that which occurs with other plants. Wherever a large collection of Orchids is brought together it usually happens that, even with skilful treatment and due attention to all, some divisions of the family will stand out markedly in the way they thrive. Here there are two sections that exhibit more than ordinary strength and vigour, the *Phalenopsis* and *Odontoglossa*, the latter holding deservedly the post of honour amongst cool species, whilst the former, taking all their properties into account, including form, colour, and habit of plant, stand equally at the head of the warm division. The long lean-to house at Mr. Bockett's with a north aspect contains some 1400 plants of *Odontoglossums*, which for size and strength individually and collectively, combined with the quantity and vigour of the flower-spikes they are pushing up, it would be difficult to match. By what we see here it would seem that the size and number of spikes with the quantity of flowers which the *O. crispum* group will produce when the plants have attained their maximum strength and size, is only beginning to be realised. Nothing in their way could well be finer than this extensive collection of this lovely Orchid, combined with all the best forms of other species of the genus. The large number of *Phalenopsis* still keep on forming bigger leaves of the right character, thick and broad, having an unmistakably hard robust appearance, indicative of their ability to endure long. All the species seem to do equally well.

ANACTOCHILUS.—Of these pearls amongst variegated plants, the cultivation of which used to be attempted by most people who formed collections of Orchids, but with whom success in the matter of these exquisitely beautiful of Nature's vegetable productions was by no means in all cases such as might have been desired, they having a disagreeable lack of thriving for a time, and then refusing to grow, in all probability through too much shade, heat, and insufficient rest, there is in the Clapton Nursery a large healthy stock, comprising most of the best of the old, and some new kinds. Amongst them are fine examples of *A. Lowii* and *A. Lowii virens*, the latter possessing an indescribably beautiful shade of green tawny the exquisite tracery of network with which the face of the leaves are covered; *A. setaceus*, *A. Boylei* not unlike *A. intermedia*, *A. Rollissoni*, *A. Dawsoni*, *A. petala*, *A. intermedia*, and others, forming together a very complete collection.

ZYGOPETALUM MANILLAE at CLAPTON.—Blue is the scarcest colour in Orchids, being confined to a very few species. This *Zygopetalum* has long been known to Orchid growers, but has never been plentiful nor held so much in estimation as it deserves. Yet now admirers of the plant seem to be awakening to its merits, which is not to be wondered at, taking into account the little room it occupies, and the quaint beauty of its flowers, which, though smaller, are equally beautiful with the best of the *Bollean*s, the blue kinds of which it resembles in colour. Amongst a number of unusually large and healthy masses, many flowering freely, there are some charming forms, remarkable for the size of the blooms and the depth of shade in the colour.

PONTHIEVA MACULATA, Lindl. ! (*Schoneibniana benigna*, Klotsch).—I quite agree with my lynx-eyed friend, Mr. N. E. Brown, that *Ponthieva maculata* is "exceedingly pretty and interesting" for people of refined love of Nature. Ah, it has no crimson flowers to beat those of *Papaver orientale* or *Tulipa Greigii* ! I also share Mr. N. E. Brown's pleasure as to those cylindrical blunt cellules, which are bent under at an acute angle over the surrounding green cellules, forming a kind of cone (or hill) around their bases. They have such a firm protoplasmic content as to break up the light, as if they were nearly diamonds, no

doubt for attracting the insects. The plant is one of the very numerous discoveries of Director Linden, who found it in 1842 on the Tilla of Caracas, in the colony of Tovar and province of Merida (see *O. Lindl.*, p. 26). Lucky times when such discoveries could be made. Director Linden compares the leaves with those of *Arnica montana*; but leaving far around other grander things, he did at last not express his opinion more strongly than by calling it "a singular plant." Whether it has not flowered before in the United Kingdom I cannot say. There is, however, a certain quotation of a no doubt English representation in *Fritzel, Leon. Index*, zweiter theil, p. 227; *Moore Mag.* 1850, p. 248, whose investigation might be recommended to Mr. N. E. Brown. On the Continent the plant has been in cultivation for a long time, having been introduced by Director Linden; it flowered with M. Pescatore! of St. Cloud, near Paris, under M. Luddemann's excellent management (see printed *Catalogue de la Collection d'Orchides*, de Pescatore, 1849, p. 321). Of course M. Linden had kept for himself *sa part*, and may have flowered it at Luxemburg. Later it was introduced by Director Linden! who had it in very fine bloom at Brussels; it also flowered with Herr L. Reichenheim! (see his printed *Verzeichniss*, 1859, p. 17); at Berlin, with Herr Kerferstein! Krollwitz bis Illale; grown by Herr Bötger, Consul Schiller (see his last printed catalogue, 1857, p. 61); grown by Herr Hange, with Herr Serron Jenisch!; grown by Herr Kramer (see his printed catalogue, p. 42). Specimens from all those places are at hand. My wild specimens came from Linden, 140! Moritz, 208! an unknown collector (viz., not named to me) of Mr. Low, 188! Schlim, 1020! Funck and Schlim, 486! 1888! Engel, 205! Patin! Otto! Arnold! It comes from Caracas and Merida, as well as from Ocaña and Medellin. A fresh importation was lately made by Mr. Sander, of St. Alban's, who would appear to believe we have not enough Orchid culture. *H. G. Rihb. f.*

Natural History.

"THE NIGHTINGALE for fifteen days and nights never giveth over, but chaunteth continually, at that time, as the trees begin to put out their leaves thicke. And surely, this bird is not to be set in the last place of those that deserve admiration; for is it not a wonder that so loud and cleere a voice should come from so little a bodie? is it not as strange that shee should hold her wind so long, and continue with it as shee dooth? Moreover, shee alone in her song keepeth time and measure truly; shee riseth and falleth in her note just with the rules of musicke and perfect harmonie; for one, while in one entire breath shee draweth out her time at length treatable; another, while shee quavereth and goeth away as fast in her running points; sometimes shee maketh stops and short cuts in her notes. Another time shee gathereth in her wind and singeth descent between the plaine song, she fetcheth her breath againe, and then you shall have her catches and divisions; anon, all of a sodaine, before a man could thinke it, shee draweth her voice, that one can scarce heare her; now and then she seemeth to record to herselfe, and then shee breaketh out to sing volutarie. In somme, shee varieth and altereth her voice to all keyes, one while full of her larynx, long, briefe, semi-briefe, and minims; another, while in her crotchets, quavers, semi-quavers, and double semi-quavers; for, at one time, you shall heare her voice full and lowd, another time as low; and, anon, shrill and on high, thicke and short when shee list, drawne out at leisure againe when shee is disposed, and then (if shee be so pleased) shee riseth and mounteth up aloft as with a wind-organ. Thus shee altereth from one to the other, and singeth all parts—the treble, the meane, and the base. To conclude, there is not a pipe or instrument againe in the world (devised with all the art and cunning of men so exquisitely as possibly might be) that can affoord more musicke than this prettie bird dooth out of that little throat of hers." *Holland's Translation of "Pliny's Natural History,"* 1601, book x., cap. 29.

MARÉCHAL NIEL ROSE.—In March, 1880, I planted a *Maréchal Niel* about 2 feet high against the wall in my conservatory; last summer it had covered the whole of the roof, and I gathered 169 perfect blooms. This year the first bloom was picked on February 12, and up to this date I have gathered 525 perfect blooms, and there are a few blooms yet. All the flowers were of a perfect shape and colour, and the colour and strength of the foliage was remarkable. The conservatory is a lean-to 11 feet high and 27 feet by 15 feet. *H. E.*

The Apiary.

THE death of the great naturalist, Darwin, naturally recalls to all who have been even in the most superficial manner familiar with his writings how deeply he had studied the ways and operations of insects, and how much he has told us of the vast services they perform in Nature. There are no insects—not even the familiar worm, if I may put them into the insect category—that have so much of interest for us as the bees have, not only because they are to us of insects the most familiar, but also because they are almost domesticated and so useful. Many who have rarely given a thought to insect life have found their minds inspired to thought and enquiry through watching the habits of their bees as they have gone too and fro in their ordinary avocations or have developed their annual migratory instincts. To those who are burdened with unempowered hours bees present occasions for work or pleasant contemplation that are eminently profitable, and when days, weeks, nay, months have been spent in watching their movements the thoughtful man still remains in doubt whether to class them as intelligent or as leading existences that are purely mechanical. I have sometimes thought that the so-called instinct shown by bees often bordered upon intelligence, and at other times that they were but little blockheads. Not long since I stood a frame light on the eastern side of a hive, because the wind came from that direction strong and cold. A day or two after, owing to a change of wind, I shifted the shelter to the west side, and then noticed that the insects returning home all came to the west side of the light instead of going to the east, although the hive remained as before. Again, in the night I removed a hive 3 feet directly forward, and as a result next day the bees for a long time hovered about just where the hive had stood. In another case, some bees, where the hive had become too densely populated, had hung out all the night, and heavy rain coming next morning and during the day left them in a nearly dormant condition. I got them into a box, put a pane of glass over it, and set them by the fire to get warm and dry. This was late in the evening, and after the insects had been outside the hive quite thirty-six hours, and yet when taken out into the garden and liberated each bee flew straight to its particular hive, although three others were close by. But what is much more remarkable is the peculiar way in which the insects make a direct line for home when, although perhaps half a mile or more distant, they have obtained the needful load of honey.

This extraordinary power is certainly not more remarkable in the bee than it is in the carrier pigeon, especially when the latter is taken 100 miles by rail in a box to a totally strange district, and then liberated. No one would hold that when the liberated bird had made its lofty gyrations that it could see its far-distant home, and how so assuredly it should thus strike the desired spot and make at once for it is so marvellous that neither such commonplace terms as instinct or intelligence serve to satisfy thoughtful inquiry. The bee in its journeyings is placed in no such difficulty. It can at least take note of the various landmarks on its outward journey, and thus trace its course accurately home, but whether it does so, or whether, like the pigeon, it is guided by what is commonly termed "uncerring instinct," we do not know. A simple experiment, however, would be to catch half a dozen of bees from a particular hive, mark their bodies with some distinctive colour, feed them that they may not be induced to loiter, and then to liberate them at various distances from home. A careful watcher at the hive could soon detect whether they arrived, and at exactly what moment. The conformation of an ordinary straw hive is not favourable to good sanitary conditions, and therefore when the hive is densely populated a change of air to promote health and lower the temperature becomes needful. This is performed by some three or four of the bees standing at the mouth of the hive, whose tiny wings vibrating with astonishing rapidity, serve, curiously enough, not to force air into the hive, but to draw the internal air out. At least, after careful experiment, such is the result I have found, the current always being going outwards. *A. D.*

The Kitchen Garden.

TOMATO PLANTING.—Preparations should be made next week for getting the earliest batch of plants, which were raised for this purpose at the end of February, planted out. The first step to be taken in this direction is to get the necessary number of holes opened between the fruit trees under a south or west wall, and to put into each hole half a barrowload of compost, consisting of three parts good loam and one of well-decomposed stable-dung. The plants, which should be thoroughly moist at the roots before being turned out of the pots, and previously hardened off in cold pits, should then be planted (one plant in each hole), and in doing so the soil should be pressed firmly about the plants, which should then be made secure to the wall by shreds and nails, leaving room in doing so for the development of the shoots. This done, a Spruce bough should be stuck firmly in the ground in front of each plant for protection from late frosts (should we unfortunately get any) and cutting winds.

CELERY PLANTING.—Amongst the various modes in practice of carrying out this operation the most preferable, and the one which we shall here recommend, and which is as simple as it is effective, is the following:—The trenches, which should run north and south, should be a spit deep, 16 inches wide, and 4 feet from centre to centre, should be got ready at once for an early planting; and the ridges, which are between, and formed by the soil taken from the trenches, should have a good slope, in order to catch and lay the trench well open to the rain. Six or eight inches thick of the best dung that is to be had on the place should be dug into each trench, and the soil broken fine as the digging proceeds; then assuming that the plants have been properly hardened off, take them up carefully with a ball of earth and manure adhering to the roots, and in the event of there being any suckers attached to the plants remove them, and plant one row in each trench at 9 inches from plant to plant in the row, taking care in doing so that the plants are not buried deeper in the soil than they were before, and that the soil is made moderately firm about their roots, which should then be watered through a long-spouted watering-pot and a rose, to settle the soil around the roots. In the meantime, and before the Celery plants are planted, each ridge can be planted with two rows of Lettuce 9 inches apart (measuring $4\frac{1}{2}$ inches on either side from the centre of the ridge), and 12 inches from plant to plant in the row, the plants in the second row being planted anglewise to those in the first, which will afford them more room to grow than if planted opposite. The planting should be done from the trench, and before the dung has been put or dug into the latter.

EDGE CUCUMBERS.—For these make a trench 4 or 5 feet wide, 16 or 18 inches deep, and in length according to the number of plants to be grown, and fill it with long stable-dung and leaves, chiefly the latter, and raise it about 2 feet higher than the surface. The whole should then be well trodden, and subsequently covered with the ordinary garden soil, after which mounds should be formed of prepared soil (three parts of light loam and one of well-trodden dung and leaf-mould) at 5 feet from centre to centre along the middle of ridge, on which handlights, which should have been previously washed, should be placed, and the Cucumber plants planted in them, watered, and shaded for a few days from bright sunshine until they have established themselves: cover up at night with mats.

SEED SOWING.—A good sowing of Peas of such varieties as the following should now be made, viz., Ne Plus Ultra, Champion of England, Telephone, &c., from which sowings Peas will be fit for gathering early in August. Broad and French Beans (Seville Longpod and Canadian Wonder) should also be sown at intervals of a couple of weeks to supplement the supplies which previous sowings will yield. And with the same object in view, sowings of Turnips, Lettuce, Radishes, Mustard and Cress, and Spinach, should be made and duly protected from the ravages of birds; and also a small sowing of Basil (bush and sweet) and summer Savory, and plant out those raised in heat and only hardened off for that purpose with

the soil adhering to the roots in rows from 12 to 15 inches apart and the same distance from plant to plant in the rows.

GENERAL WORK.—This will include the thinning and weeding of Turnips, Carrots, Parsnips, Spinach, &c. The plants should be left at from 6 to 9 inches apart in the rows. The earthing-up and sticking of advancing crops of Peas, Cauliflowers, &c., together with the weeding and rolling of all gravel walks in connection with this department, will, in the ordinary course of routine work, receive due attention. Asparagus-beds will also require attention in regularly cutting the shoots as they become fit, taking care in doing so not to injure the crowns of the plants, nor the shoots below the surface, with the knife. Prick out young Celery plants in 2 inches of finely sifted soil, which has been placed over 2 inches of strong dung on a hard surface out-of-doors in rows 4 or 5 inches apart, and the same distance from plant to plant in the rows, and water and shade the plants for a few days until they have established themselves, and see that the plants have plenty of water afterwards.

FORCING DEPARTMENT.—French Beans, which should now be grown in pits, will require attention in the way of watering and syringing, and Capsicums which are intended to be fruited in pots should now be shifted into larger ones, as they require more room at the roots, and those which are intended for planting out-of-doors later on should be gradually hardened off for that purpose. Tomatos swelling their fruit should, if not already done, be top-dressed with a mixture of loam and horse-droppings, about three parts of the former to one of the latter, and in addition to this, let them have frequent supplies of diluted liquid manure to the roots, and the shoots and leaves of the plants must be kept well pinched, and the fruit fully exposed to the sun. *H. W. Ward, Longford Castle Gardens, Wilt.*

Plants and their Culture.

STOVES.—Alcascas that have pushed up any flowering spathes should be looked to and have the same removed carefully, so as not to injure the bulbs: A. metallica and Lowii are rather persistent in this respect at this season of the year, oftentimes retarding the proper development of the young leaves. Ours have now started into fresh growth, and the young rootlets are actively laying hold of the fresh top-dressings of sphagnum moss and rough peat. A. Thibautiana is a vigorous grower; see, therefore, that young plants are shifted on before becoming pot-bound. With liberal treatment it will perfect splendid foliage of an enduring character. These remarks should also apply to the fine-leaved variety of Anthurium, than which scarcely any more handsome stove foliage plants can be grown, where there is plenty of room for their culture. Plants of Caladium aryanites that are now in free growth may with advantage receive a shift of most of ours that were started in 00's are now being transferred into 4's and small 32's, using a light open soil with a preponderance of leaf-mould.

Where it is desirable to induce an early growth in any Cycads which may have been in a temperate-house during the winter, it is a good plan to remove them into a warm stove. The increased heat and moisture in most cases induces them to push up a fresh crop of leaves, that will become perfected and matured sufficiently early to be used in cool houses or conservatories during the summer months. From a large specimen of Cycas revoluta, that is now throwing up a strong young growth, we have removed several offsets that have been potted up. At the time our object was to strengthen the central crown; the small offsets were at first cast aside, but finding them to retain their vitality they have been potted, and are now commencing to grow. Where any cycadaceous plants require potting the present is a good time to do it, using a soil with plenty of texture—good turfy loam and the best of peat, two-thirds of the former to one of the latter, with a slight sprinkling of half-inch bones and some charcoal, also silver sand. Remove any of the old ball that is not occupied with roots, and in repotting see that the new soil is pressed around the old, and that quite firmly.

Water sparingly till fresh root-action commences with a corresponding top growth.

FERNS.—These will want close attention where they are now in active growth. Some sorts require more shading than others. The most susceptible in this respect are the larger forms of Maidenhair, such as A. cardiochloena, A. trapeziforme, and A. Sancte-Catherine, which are soon disfigured if exposed to bright sunshine. A. Farleyense will do with rather less shade, so also will those kinds of which A. cuneatum may be taken as an example; while others, such as A. tinctum, A. Veitchii and A. concinnum latum, are only to be seen in their beauty when the least possible amount of shading is applied. These latter kinds will then throw up young growths of a beautiful rose-red colour, rendering them very attractive against the deep green hue of the older fronds. Such Ferns as the Cheilanthes and Gymnogrammas should have a drier position afforded them, where they are not liable to receive the contents of the syringe. Where any sign of damp is seen remove the decaying portions, also all of the oldest fronds a few at a time. In the cultivation of these Ferns it should be borne in mind that, though thriving in a dry atmosphere, they require an abundance of water at the root, of which they are at all times very impatient. These latter remarks also especially refer to Pteris scaberula, and most of the Gleichenias. All Ferns intended for the summer decoration of the conservatory should receive attention now; encourage fresh growth, so that the plants may the more readily withstand rough treatment. This they will be the more likely to do when an early growth is secured. The replenishing of Ferns in Ferneries where grown *au naturel* should be seen to if not already done. Some will often be found to be outgrowing other kinds; such should be reduced or removed to more roomy quarters. Good associates in Ferneries are to be had in ornamental foliage Begonias, Vinca elegantissima and Ligularia Kaempferi argentea. The dwarf growing Selaginellas are also useful as a carpet or undergrowth. Tradescantias and Panicum variegatum must not be overlooked, neither should Saxifraga sarmentosa. All these aids will produce excellent effect when judiciously used. While the operations of replanting and renovating are going on add as much fresh soil as can be used.

COOL GREENHOUSE.—Pelargoniums of the show and fancy kinds will now be rapidly advancing into flower. Supply them liberally with water, and use stimulants frequently. Watch very closely for aphid, and give the whole collection a thorough fumigation before any blossoms are expanded. If the various Calceolarias must also be sharply looked after. Do not let them be too freely exposed to the sun when in full bloom. The present will be a good time to make a sowing of Primulas for next winter's bloom, if not already done. Cinerarias may be left a little later; retarded plants of these are now coming in most serviceably. The latest batch of Hoteia japonica may now be safely trusted in the open air. Chrysanthemums should have a favourable situation given them outside, reporting as may be necessary, the better to preserve the lower leaves. Another batch of cuttings from the pompons will give a handy lot of plants of a medium height. *James Hudson, Gimmersbury House, April 25.*

Peaches and Nectarines.

The stoning process in the early house will very soon be complete, and when such is the case, and the fruits have commenced their last swelling, they may, if required, be pushed on a little faster than they have hitherto been, which cannot be done more efficiently than by closing early on bright sunny days, allowing the temperature to run up to 80° or 85°, at the same time keeping a steady night temperature, as advised in last Calendar. Keep the roots well supplied with tepid manure-water, which may now be given a little stronger. Get the fruit well up above the foliage by placing short pieces of ceiling-lath from wire to wire. I have adopted this plan for some years, and have always found the fruit better flavoured when kept well above the foliage, and of course a much better colour, which well repays you for the little extra trouble. Second houses this season are nearly as far advanced as early ones, and require the same treatment. Succession houses will have commenced stoning, and may be allowed to grow away freely for a time, just stopping and tying in the strongest shoots. Late houses will now require disbudbing. Heel down young shoots; thin fruit, leaving plenty to allow for dropping; keep the roots well supplied with water, and ply the syringe freely. *J. Wallis, Kete Gardens, April 25.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY	May 1	Sale of Imported and Established Orchids, at Stevens' Rooms
WEDNESDAY	May 3	Sale of Imported Orchids, at Stevens' Rooms
THURSDAY	May 4	Meeting of Linnæan Society, at 8 P.M. Sale of Imported and Established Orchids, at Stevens' Rooms.

WITH every mark of honour and respect, and in the presence of a very large gathering of representative men of all classes—nobles, clergy, statesmen, judges, men of science—the remains of CHARLES DARWIN have been worthily laid in the only place fitting for the reception of such a man—Westminster Abbey. The sight was, indeed, a most imposing one. The memories attaching to the place, the last resting-place of so many of the great and good, were striking enough; but the gathering of living men was, if possible, even more noteworthy. The State, the Parliament, the great Universities, the Scientific Societies, the Church, Foreign Nations—all sent their representatives to mourn the loss of a simple country gentleman, plain CHARLES DARWIN. A plain country gentleman indeed, but one who has conferred honour on the nation, contributed directly so much to the stock of knowledge, moulded so powerfully the current of ideas, and set in action the springs of research in so many branches of thought and work. His genius and his labours have been cordially recognised on all sides, the Press of all shades of opinion has borne testimony to the greatness of the man. Foreign nations have vied with ourselves in paying honourable tribute to the memory of the great philosopher. There is, therefore, no need now to point out what it is he has done—its value is recognised, the future will but enhance his reputation.

What we would prefer now to advert to, is the character of the man and his method of working. Such a man is not likely to appear again in our times, but we may learn much from his inspiration and his method of work. Foremost amongst his characteristics we place his absolute love of truth. No one strove more jealously to be accurate in all that he did and said. To get at the truth was the object of all his work, of all his speculations. It was impossible for such a man to stifle his imagination, his constant daily work of necessity suggested free speculation, but that speculation was always curbed and restrained, so that it never outran the basis of the facts that he accumulated with such patient zeal. Whenever tempted to indulge in speculation, it was always so safe-guarded that the reader never was left in doubt as to what was fact and what was inference. In a letter before us relating to some point on the subject of the fertilisation of flowers occurs this passage, "But then I wish this, and how hard it is to prevent one's wish biasing one's judgment." Surely no one more honestly and candidly strove against this bias—surely no one more thoroughly succeeded in overcoming it. The candour and faithfulness with which he pointed out the weak places in his own arguments, the full consideration he gave to the opinions of his opponents, his perfect courtesy to others who thought differently from himself, were all dependent on his absolute love of truth.

Another most striking feature of his character was his modesty, amounting even to diffidence. If others thought him great, no such impression actuated him. In corresponding or conversing with him, one was never made to feel that he was a great master and his correspondent a tyro. In communicating facts or observations the answer one received was couched in such terms as these, "You cannot do me a greater service than by pointing out errors;" or, again, "If at any time anything should occur to you illustrating or opposing my notions and you have leisure to inform me, I should be truly

grateful," and this from a master to a mere tyro.

These are no solitary instances; no one who approached him but was treated in the same manner. The encouragement thus held out to vast numbers of people is one secret of the gratitude and respect now shown for his memory, and this considerateness was coupled with an entire freedom from aggressiveness. When he was attacked with rancorous ignorance or shallow ridicule, as was the case at first, he made no retort or reply. Fair argument he was open to consider and give due weight to. Retaliation and pugnacity such as have characterised some of his disciples had no place in the mind of CHARLES DARWIN, or if they had they were so thoroughly under control that they were never made apparent.

As to his method of work it is transparency itself—simply the accumulation and ordination of facts, the search after evidence, the weighing and computing that evidence, and then the well digested inference as the legitimate outcome of all. Other men perhaps have been as diligent in accumulating evidence, but where shall we find one who arranged that evidence in such logical sequence, where one who so carefully separated the weak from the strong?

In reading his books one is led on insensibly from point to point, the foot made sure at each step, till, warned by the author himself of the pitfalls and doubtful places on the way, the reader is irresistibly led to the same conclusions as those the author himself arrived at. He does not so much impose his opinions on the reader as make him evolve them for himself. It is not this detail or this inference—the one may be fallacious the other may be wrong, but the whole body of evidence compels assent. And it must be remembered that it was not as a mere accumulator and digester of facts observed by other people that DARWIN is so remarkable. In his quiet home and garden at Down he worked out for himself the solution of many of the problems that occurred to him. Patient experiment and laborious personal investigation were added to careful study of what had been done by others. This and thus only has DARWIN done his work.

In some sense circumstances were propitious to him—in Darwinian phrase, the "environment" was favourable. The possession of ample means, the opportunity for travel in his youth, of which he availed himself to such good purport; freedom from the trammels of official duties of any kind, or from the necessity of working for his living, with no inclination to enter into what is called society, DARWIN had leisure to follow the bent of his mind. Surrounded by his sympathetic friends, with adequate means of study at hand, in a remote and pictorial country village, but within reach of the resources of the metropolis, the conditions, for a man endowed with such a temperament, would seem to have been exceptionally favourable but for one flaw—that of ill health. How any man with such weak health (enfeebled if not set up by his five years' travel in the *Beagle*) can have got through such an amount of mental, ay, and physical labour, is one of the marvels that pertain to this great and good man.

He has gone to his rest, and the lesson of his life is one of encouragement. It may be long ere such a genius again arises; but his method of working, as we have seen, was not mysterious—in its degree, it may be followed by all of us. We may follow in our halting fashion his method—we may strive to imitate his candour, his modesty, his love of truth, and in proportion as we do so, we, too, may advance that knowledge, the progress of which it was DARWIN'S life-long aim to urge forward.

—EVOLUTION AND GARDENERS.—It was an undesigned but not the less striking coincidence that so much of the time of the committees of the Royal Horticultural Society at their last meeting was taken up with the history of the Auricula and the hybridisation of the Rhododendron. Mr. HIBBERD was able to show how the history of the Auricula is in itself a history of evolution. DARWIN (as he himself stated) in some degree borrowed the ideas of the florists, and personally followed to a considerable extent their method. The divergence between the florists and the physiologists—a divergence to which Mr. HIBBERD alluded—begins when the florist lays down for himself, for his own purposes, for the indulgence of his own fancy, a more or less artificial standard of beauty, while the physiologist on his side seeks to ascertain how Nature works her own ends untrammelled by the subjective fancies of the florist. The question is, whether, from a florist's point of view—that of beauty—it would not be better to work upon the lines laid down by Nature in each kind of flower respectively, and by following her indications to develop their beauty in a strictly natural manner, rather than by imposing an arbitrary standard based upon personal authority and taste. But it is useless to argue on questions of taste; the important fact is that, largely by the undesigned co-operation of "raisers" and physiologists, a great principle of science has been established; and if this has happened undesignedly what might we not expect were the labours of the gardener and improver conducted wholly, systematically, and regularly on the same lines as the physiologist works upon? It is an error to suppose that the scientist of the present looks down, as perhaps his Linnæan forefather did, on the results of what has been done by the florist. The law of evolution, the gradual development and progress by selection of some sort, and under favourable conditions, is the law laid down so prominently by DARWIN. The florists and raisers of new varieties, whether they know it or not, have in their way all along been working out, in their own fashion, and subject to their own self-imposed restrictions, according to the law of evolution. Like M. JOURDAIN, who talked prose before he was aware of it, the raisers of improved forms have been practical Darwinians before DARWIN existed! The case of the Rhododendron is, in its way, quite analogous—man does in one way what is done in Nature by the agency of insects or otherwise; but, while in Nature hybrid productions are rare, and often die out, because not so well adapted to the surrounding conditions as their competitors, in the garden the care and art of the gardener is exerted to protect and ensure the survival of the forms brought into being by their skill in availing themselves of Nature's pliability.

—THE PRESENTATION TO MR. THOMAS MOORE will be completed at a complimentary dinner at the Cannon Street Hotel, on Tuesday, May 23. As the number of seats will be limited, accommodation can be afforded only for those who give timely notice of their intention to be present. The charge for each seat will be 21s. Mr. SHIRLEY HIBBERD, 15, Brownswood Park, London, N., will give prompt attention to all communications on the subject.

—SMILAX CHINA.—In the winter garden at Kew this pretty climber, with its glossy leaves and long climbing tendrilled shoots, is now in flower. It is interesting, as being of some economic importance, as it furnishes the China root of commerce, which is said to possess alterative and sudorific properties. Two or three centuries ago this was regarded as an infallible remedy for gout, but it has shared the fate of many so-called infallible remedies, and has nearly fallen into disuse. The root-stocks (eaten by the Chinese) yield a yellow dye with alum, and a brown one with sulphate of iron. S. China makes a pretty wall plant in sheltered situations.

—AGRICULTURAL EDUCATION.—The Lord President of the Committee of Council on Education has appointed Professor WRIGHTSON, President of the College of Agriculture, Downton, near Salisbury, as the first Professor of Agriculture in the Normal School of Science, and Royal School of Mines, South Kensington. Professor WRIGHTSON has for many years been well known as a scientific agriculturist, and is also the occupier of a large mixed farm. We congratulate the pupils of the school in the selection of so competent a Professor.

— *GOODIA LATIFOLIA*, in the Winter Garden at Kew is one of the most ornamental of the pot plants now in flower. It is a neat-habited bush, with alternate trefoil-like leaves, and terminal racemes of bright golden-yellow Laburnum-like blossoms. *G. pubescens* has smaller leaves and flowers than *G. latifolia*, and, although worthy of a place in the cool conservatory, is not nearly so handsome a species as the first-named one. The genus is named in honour of PETER GOOD, an employe in the Royal Gardens at Kew, who was sent out as collector to

opened some weeks back, but genuine young growth. Lilacs were open last week, as also Hawthorn, with Laburnums showing colour. The forwardest Horse Chestnuts had flowers open on the 10th of the month, and the earliest Oak leaves were unfolded on the 6th; the Ash is further behind other trees in leaving this year than usual, showing its proverbial cautious habit, but it is on the move. The earliest heads of Rye were last week shot right out, and seed Turnips were shedding their flowers. One general feature in trees and shrubs like

China (*I. anisatum*), was introduced to Europe by the celebrated traveller and botanist, SIEBOLD, and shortly afterwards was figured in the *Botanical Magazine*. There seems no doubt that in many places in the South and South-west of England this handsome shrub would succeed well in the open. From the letterpress accompanying the figure just mentioned the following particulars are derived. In Japan *I. religiosum* is looked upon as sacred; branches and wreaths of it are placed over the tombs of their friends by the Japanese, and their priests burn its

ROBERT MARNOCK.

Australia, where he died. An account of his life and work, from the pen of the veteran ex-Curator, appeared some time ago in these columns.

— EARLINESS OF THE SPRING.—The present is likely to be remembered as a most exceptional season, the spring, like the winter, being unusually mild, which, as a matter of course, has so far had a marked effect on vegetation. In North Middlesex, at the end of the third week in April, may be seen on south walls Honeysuckles, Gloire de Dijon, Maréchal Niel, and the old blush China Rose, with flowers fully open—not buds that were formed in autumn, such as have been reported as having

this spring is the profusion of flowers they present. If the May frosts that of late years have been so prevalent should keep off, most crops that suffer through them are likely to be abundant and unprecedentedly early. Previous to the rain which within the last few days has fallen, the wells were almost as low as they usually are seen in summer.

— THE SACRED ANISE TREE OF JAPAN.—In the open border at Kew a nice bush of this interesting and pretty shrub is now in full bloom. It has numerous rather large white flowers, nestling amongst the dark green leathery leaves. This species, which was formerly confounded with the true Star Anise of

bark as an incense on the altars of their deities. A singular use is made of the pulverised bark by the public watchmen. Hollow tubes, graduated on the inside, are filled with this substance, which is lighted at one extremity, and burns gradually and uniformly, so that when the fire has reached a certain mark the watchmen strike the hour upon a bell, and thus announces it to the public.

— MACKAYA BELLA.—A full-page illustration of this beautiful Acanthad, which was prepared from a specimen from the celebrated garden of Sir GEORGE MACLEAY, at Pendell Court, appeared in our columns for 1879, vol. xi., p. 629. It was first

discovered by Mr. J. SANDERSON in the bed of the Tongat River, in Natal, and was described by him as a beautiful shrub, one mass of most delicate pale lilac campanulate flowers. Unfortunately it has with some justice earned the reputation of being a shy flowerer, for neither at Kew nor at Pendell Court does it flower every year, although it grows with great vigour. The Kew plant, which is now flowering in the Palm-house, was kept purposely restricted as to pot-room, &c., and after having made its growth as subjected to a gentle course of "drying off."

— **GENISTA PURGANS.**—In the Kew Arboretum one of the showiest of the smaller shrubs is the subject of this note. It forms a low, round, compact bush, the dark green almost leafless shoots of which are thickly studded with bright yellow flowers. A native of South Europe.

— **A ROSE SHOW AT THE MANSION HOUSE.**—The Lord MAYOR and the Lady MAYORESS will hold a Grand Rose show, on June 29, at the Mansion House, in aid of the proposed Scarlet Fever Convalescent Home, and of the Royal Hospital for Women and Children, Waterloo Bridge Road. The exhibition will consist of 10,000 Roses, from the gardens of the principal growers, arranged with Ferns and other accessories in an artistic manner. There will also be an exhibition by amateur growers, among them some of the leading citizens, who have taken up the idea with great spirit, and who, at a recent meeting at the Mansion House, promised the Lord MAYOR their hearty support in the preparations. Among the bodies represented will be the Stock Exchange and the Commercial Sale Rooms, the Corn and Coal Exchange, &c. The Lord MAYOR has entrusted the arrangements to Mr. J. FORSYTH JOHNSON, Horticultural Director of the Alexandra Palace.

— **CYPRIPEDIUM PUBESCENS.**—What a handsome object this hardy North American Lady's Slipper makes when treated as a pot plant, and how well it will bear forcing, is exemplified by a fine specimen at Kew. Each growth is terminated by a large flower, with its twisted brownish sepals and petals, and large pleasing yellow lip spotted internally with reddish-brown.

— **TREE OR PERPETUAL FLOWERING CARNATIONS.**—The main interest of the meeting at South Kensington on Tuesday last centred in the Auricular, and other objects of value scarcely got that attention they so well deserved. It was not till late in the day that the committee of the National Carnation and Picotee Society inspected a batch of very fine scarlet and rose-flowered tree Carnations staged by Mr. C. TURNER, Royal Nursery, Slough, and first-class Certificates of Merit were awarded to the following varieties:—*Conqueror*, salmon-rose, slightly striped with purple, distinct, large, and full; *Enchantress*, pale rose paling to pink on the edges of the petals, and flecked with dark purple, extra fine and distinct; *Flambeau*, pale creamy-lemon ground, the petals deeply suffused and edged with black and dull red, very fine petal, and full substance; *Hector*, pale red, finely-shaped petal, and full flowers; *Nimrod*, pale bright red, very fine petal, flowers large and full; *Premier*, bright crimson, very fine, a little rough, but flowers full and of good size; *Rufus*, rich scarlet shaded with dark, large, full substance, fine petal; and *Whisper-in*, scarlet, flaked with black, distinct, fine and free. It was a grand batch of seedlings, all of good habit and remarkably free of bloom, and invaluable for cutting from at this season of the year.

— **STANDARD ROSES IN POTS.**—A group of some thirty plants of these, staged by Messrs. VEITCH & SONS from their Coombe Wood Nurseries, were a special and marked feature in the conservatory of the Royal Horticultural Society on Tuesday last. That such Roses, equal to those grown in the best soil that a Rose can delight in when cultivated in the open ground, should have been produced in pots of comparatively small size, was a real surprise. What massive heads they had—what healthy and fine-coloured foliage—and what splendid flowers they bore—these were characteristics noted by all. With the exception of three or four of the Tea-scented varieties, these standard Roses had been in the pots for four years without being shifted, and those shifted last autumn had occupied the same pots three years without a shift. In the autumn some 3 or 4 inches of the surface soil is

removed, leaving bare the upper roots. A good layer of Clay's Fertiliser is laid in first, and then a dressing of rich and suitable soil is added. The plants are kept in a cold-house, and a little fire-heat is applied in spring—only, however, when there is danger of frost affecting the young growths. A good surface-dressing of Clay's Fertiliser is given once or twice during the spring. Pruning is done early in the year, the shoots being cut back to a strong eye or two, and when these come away they make a vigorous growth. Many of the flowers were quite good enough for an exhibition stand. Those of La France were particularly fine; those of Jean Ducher especially so; they were truly ravellous in development. The leading varieties were Marie Baumann, Madame Victor Verrier, Prince Camille de Rohan, Beauty of Waltham, La Rosière, Jean Liabaud, Marchioness of Exeter, Paul Verrier, Marquis de Castellane, Magna Charta, Hippolyte Jamin, Madame Rougier, Edward Moren, Alba mutabilis, Monsieur Noman, Marçal Niel, Marguerite de St. Amand, Madame Willermos, Duchesse de Vallombrosa, Catherine Mermet, and Madame Lacharme. When the plants have gone out of bloom they are plunged rim-deep in the open ground, and well looked after; and when the fogs and damp of November precede winter they are removed to the cold-house. Such a group of Roses, so varied in variety, and so uniformly good throughout, reflects great credit on Mr. HILL, Messrs. VEITCH & SONS' Rose grower at Coombe Wood. A more thoroughly interesting and instructive exhibit will scarcely be witnessed this season.

— **IONOPSIS PANICULATA.**—It is a great pity that this delicate and graceful Orchid does not submit more easily to altered conditions and the cultivator's skill, for there are few more charming species. It has an arching panicle bearing a large number of white, purplish-tinted flowers, the delicate outlines of which, according to an enthusiastic writer in a foreign book, seem to have been traced by a fairy's hand. It is a native of Brazil, and the treatment under which Burlingtonias and some of the more delicate *Oncidiums* flourish seems best adapted to it. Now in bloom in the Orchid collection at Kew.

— **LINNEAN SOCIETY.**—The following papers will be read at the meeting on Thursday, May 4, at 8 P.M.:—"Notice of Remains of the Great Auk found in Oronsay, Argyllshire," by S. GRIEVE; 2. "Cape Orchids," by HARRY BOLUS; 3. "Dimorphic Florets of *Catananche lutea*," by B. D. JACKSON; 4. "Butterfly Genitalia," by P. H. GOSSE; 5. "New Varieties of Sugar-cane," by Baron DE VILLA-FRANCA.

— **ANDROSACE SARMENTOSA** is a vigorous and handsome species from the loftier regions of the Western Himalayas. It is yet far from common in collections, but as it is readily propagated by means of its long runners and by no means requires the care and attention demanded by several other members of so interesting a genus, it will doubtless become a general favourite ere long. The red-purple blossoms are borne in long-stalked umbels. Now in flower at Kew.

— **PRUNUS SEKKULATA.**—This extremely desirable ornamental shrub was sent from China by Mr. REEVES to the Horticultural Society sixty years ago. In describing it in the *Transactions* Dr. LINDLEY says it is "One of the most ornamental hardy plants with which I am acquainted, and far more beautiful than any of the double Cherries commonly in cultivation." Several trees in the Kew Arboretum amply justify Dr. LINDLEY's statement; they are now one mass of bloom. The flowers, too, are larger than those of the common double Cherry, are produced in greater profusion, and the buds and young flowers are delicately shaded with pink.

— **GROUPS OF ADIANTUMS.**—The common practice of growing all, or nearly all, our Ferns in pots is little short of a mistake, if it is not in reality an everyday error. Cultivating so many Ferns in pots for cutting purposes is undoubtedly the wrong way of making the most of the plants, as it is also the wrong way of creating an appearance. Ferns must be grown in pots for a great many purposes which need not be mentioned, but as a general rule the effect is a tame one. Not so, however, when they are planted out with a little taste and skill. Is there

an amateur in the country who has not a corner in his plant stove or fernery where little groups of Ferns could be formed in miniature rockeries, which would be something to look at as well as to cut from? Two *Adiantums* that look remarkably pretty planted in this way are *A. affine* and *A. ethiopicum*; the latter grows a few inches higher than the former, and a group formed of both, if only to fill in a corner, will never lack admirers of what is chaste to the eye and beautiful to look upon.

— **GENTIANA ACAULIS.**—The Royal Nursery at Slough is one of the places in the South where the rich blue vase-like blossoms of this glorious plant are seen to rare advantage. On either side of a broad gravelled walk, with a shade-providing evergreen hedge behind, there are on a narrow border quite large breadths of this noble *Gentiana*, and in one corner of the nursery there is also a spacious plantation of it that is flowering superbly. The plants are so well established that they in all probability have been there for many months past. The colour is perhaps a more brilliant blue than is found in *G. verna*; the growth is in all respects larger, and no more pleasing hardy plant can be presented to notice than a good patch of *G. acaulis*, with a fine head of its flowers rising above a dense carpet of shining leathery leaves. There is perhaps something in the soil of the Royal Nursery that suits the plants, and it is certain to be well cared for, as all plants are in such a hospitable home. In some districts that are cool and moist, like the midlands of Nottingham, Yorkshire, &c., this plant does exceedingly well, and it is not unusual to see it used as edgings to garden walks and borders. It would be difficult to find a more pronounced hue of blue in any flower at all comparable with that found in this splendid *Gentiana*.

— **PRIMROSES IN KENT.**—The general testimony of the inhabitants of the Primrose districts of this county is to the effect that they scarcely remember seeing the flowers so fine and plentiful as they have been this season. Possibly the moist summer, followed by a dry time in the autumn and a mild winter, had something to do with this. A great many of the flowers have been gathered by women, and sent to London by the busket; some of the gatherers have made £2 and £3 each in this way. It is worthy of note that, in examining the flowers of the Primroses where they grow most luxuriant in the hedgerows, thrum-eyed flowers are numerous, and generally allied to fine form and substance. They have this season made a prodigious leaf-growth, more especially on the north sides of the roadways. A very handsome-coloured form was found on a bank in a country lane in East Kent a short time since.

— **MYOSOTIS DISSEIFFLORA.**—It is not a little surprising to find how much of *M. sylvatica* is distributed for this spring Forget-me-Not, and sometimes a bad form of it. Occasionally paragraphs are written in praise of the species that heads this note, and when flowers are furnished it is found an inferior type has been taken for it. The trade are unquestionably to blame in the matter, and it is due to their customers that they exercise more caution in obtaining seed of a true character. The seed of *M. disseiffora*, as figured in a recent number, is smaller in the grain, narrower also, and more pointed at the ends, with a short white stalk at one end, and not so shining as in the case of *M. sylvatica*. The seeds of the latter are broader, flatter, larger, and more shining in appearance. But as it is more of a matter for the expert in seeds to deal with such small differences as this, it may be remarked that *M. disseiffora* differs in the foliage, is earlier, has larger flowers, and is altogether much more attractive to the eye. The white forms of *M. disseiffora* of which we have heard and seen much lately, are but *M. sylvatica* alba magnified into a new variety.

— **CHOISYA FERNATA.**—This comparatively new introduction is flowering beautifully in the Clapton Nursery, and will evidently turn out one of the best greenhouse plants that has appeared for some time. It seems to be an excellent grower, and equally free in the production of its flowers. It has handsome glossy leaves, and a moderately close habit of growth; the individual flowers, which are pure white, with numerous yellow anthers, in size and general appearance are not unlike the mock Orange, *Philadelphus*, and are produced at the extremities of the shoots in large loose corymbs in the way of *Hydrangea*

hortensis, but smaller. Most likely it will turn out a good forcing plant for conservatory decoration; its handsome distinct appearance, combined with its free flowering habit, commend it to general cultivation. It comes from the temperate districts of Mexico.

— **HEATHS AT THE CLAPTON NURSERY.**—We often hear the remark that Cape Heaths are not cultivated in such numbers now as in times past. But if not it is difficult to understand what becomes of the immense quantity to be seen at Messrs. Low's, for it might well be supposed that the tens of thousands that here fill the series of long pits would be enough to stock the kingdom; they comprise most of the leading kinds, hard and soft-wooded, in beautiful condition. The old, but unequalled, greenish-yellow variety, Cavendishii, quite as beautiful and profuse in flower when small as it is in a large state, and the equally handsome ventricosa coccinea minor and v. grandiflora are most in demand for spring flowering. These are perhaps the most useful decorative kinds at this season, and there is no greenhouse or conservatory that is not improved by their presence.

— **HONESTY.**—A large patch of this fine old biennial, when in bloom, as it is just now, is always attractive, and if the pure white kind and the darker purple strains be grown the effect is so much the greater. One of the commonest of garden plants, but yet, amongst the general public, one comparatively little known, it is not strange that when inquirers asks its name, and are told "Honesty," a smile of incredulous inquiry is the result. "Why Honesty?" is at once asked, and echo answers, "Why?" perhaps, for the query is one difficult to reply to. Honesty, Thrift, Sage, &c., are designations applied to common garden plants in remote ages, doubtless to commemorate certain virtues, perhaps then not more common than now; and if the names as ordinary appellations were not as good as any others—and they certainly are—they at least serve to remind us that there are such virtues, though, perhaps, those who grow the plants must have least reason to be so reminded. The man who can grow Honesty continuously and yet be devoid of the virtue the plant typifies, must needs be devoid of all other good qualities. The plant itself, however, is not in a strict sense always honest, for it will sport, and is thus far unreliable. True the white form—away of the more compact habit of growth—seems to keep true, but then the purple will sport to white, and the spotted plants will be tall and of looser habit, like to the dark coloured Conqueror. The coarsest habit of growth is found in the pale purple, the kind that is perhaps most commonly seen in cottage gardens. This is not nearly so attractive as is the deeper coloured variety, whilst the white kind is not half known, though so easy of culture and so pleasingly effective. As a rule, enough care is not taken in sowing seed to ensure a good show of flowers in the spring. As a biennial, seed should be kept one year under another, and be sown with Canterbury Bells, Sweet Williams, Foxgloves, &c., early in May, and if where the plants are to remain and bloom so much the better. It is a common practice to let the seed sow itself, and hence an irregular bloom, and often the loss of an entire season.

— **THE JAMAICA INSTITUTE.**—A series of lectures on the natural resources of Jamaica and the best methods of developing them has just been published under the auspices of the Institute. We have already noticed the lectures of Mr. MORRIS on Coffee and Cinchona culture, and now we may mention that the other lectures are devoted to the culture of Vams, Cassava, &c., the treatment recommended emphasised with a profusion of italics, being summed up in these words—"Feed, feed, feed the soil; the timbers of Jamaica, with an appendix giving the vernacular and scientific names of the principal timber trees, with notes as to their uses. Other lectures are included on subjects of foremost importance to the colony, but which hardly come within our scope. We can but think such lectures and publications must be beneficial, and we are pleased to note in passing the testimony as to the successful results of the zeal and skill displayed by Mr. MORRIS, the Director of Public Gardens and Plantations.

— **MAGNOLIA PURPUREA.**—Next to Magnolia conspicua the above variety is perhaps the finest flowering tree of the present season. When people

are planting they do not always study future effects, nor is it indeed probable that half the planters in the kingdom have what may be termed a definite idea of the future in view when flowering trees and shrubs are huddled together anyhow in shrubby beds and borders. But there are exceptions to all rules, and a notable one may now be seen at Powderham Castle, the beautiful seat of the Earl of DEVON, where this Magnolia is associated with green Hollies and Phloxia serrulata, with its bronze coloured young leaves, against which the flowers of the Magnolia appear to be pure white, the purple streaks only appearing upon minute inspection. There is a grand bush of this variety, faultless in symmetry, fashioned upon the outside like a tea-cup, in the American garden, which is overhung by a noble Copper Beech just bursting into leaf, and which has a charming appearance. The flowers are so numerous, about two-thirds of them half unfolded, and the young leaves just showing themselves that one hardly knows whether the glowing clumps of choice Rhododendrons in full blow or the Magnolia are the prettier; and so, undecided and unable to award the palm to either, one is thankful there is plenty of room for both.

— **FLORAL DECORATIONS.**—We note with pleasure the advance Northwards of the taste and demand for floral decorations, which during the last few years has spread so rapidly in the South. Last week we had to note the success in this direction achieved by Messrs. J. & K. THYNE, at Glasgow; and have now to record a triumph in the same line obtained by Messrs. DOWNIE & LAIRD, at a ball given in Edinburgh on April 19 by the officers of the Black Watch (42d Highlanders).

— **COVENT GARDEN LIFEBOT FUND.**—Amongst recent successful musical entertainments we note the high-class concert given at St. James' Hall on the 20th inst., under the auspices of a committee of gentlemen connected with the neighbouring market, on behalf of the Covent Garden Lifeboat Fund. By the efforts of this committee the sum of £1,066 10s. has at various times been placed to the credit of the National Lifeboat Institution, and we have no doubt the result of their latest efforts will be to considerably augment this amount.

— **THE WEATHER.**—General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending April 24, issued by the Meteorological Office, London:—The weather has been cloudy and unsettled. Heavy showers of rain have occurred in all parts of the kingdom, while a sharp thunderstorm was experienced over central and south-eastern England on the 23d or 24th. The temperature has been several degrees higher than it was during last week, and was a little above the mean in all districts. The thermometer was generally highest on the 21st, when maxima of 67° or 68° were registered over eastern and central England, and 60° to 65° in most other districts. The minima which were recorded in most places during the earlier part of the period varied from 32° over Scotland and in "England, S." to 39° in "England, N.W." The rainfall has been about the average in "England, E.," but more in all other districts. At all our more westerly stations the excess was rather large. Bright sunshine shows an increase in all districts; the percentage was greatest (41) in "England, S.W.," and least (26) in "England, N.E." Depressions observed:—The barometer has been very unsteady, several important depressions and some secondary disturbances having passed over our islands in an easterly direction. The wind, which was at first north-westerly, subsequently varied between west and south, and, though moderate or light generally, increased to a fresh or strong breeze at times, and reached the force of a gale in the south on the 22d and 23d, and at some of our north-western ports on the 24th.

— **GARDENING APPOINTMENTS.**—Mr. E. BERRILL, for several years Foreman to Mr. BEECH at Castle Ashby, has been engaged through Mr. JONES, of Frogmore, as Gardener to H.R.H. the Duke of Albany at Claremont.—Mr. JAMES INGLIS, from Messrs. DOWNIE & LAIRD'S, Finkhill Nursery, Corstorphine, Edinburgh, has been engaged as Gardener to ex-Provost LINDSAY, Hermitage Hill House, Leith.—Mr. JOHN MELVILLE, late Gardener at Great Tew Park, Eastone, Oxon, has been engaged as Gardener to F. PEEL, Esq., Roly, Sydenham Hill, S.E.—Mr. EDWARD ROGERS has succeeded Mr. MASTERMAN as Gardener at Scilly Hall, Bawtry, Yorks.—Mr. W. J. CLARKE, late Foreman to Mr. THOMSON, Kilkerran, Ayrshire, has been engaged as Gardener to Mrs. CARSON, Spinfield, Great Marlow.

ROBERT MARNOCK.

AMONGST modern landscape gardeners the name of Robert Marnock, now an octogenarian, reposing on his laurels, occupies the highest position. His reputation in this department of gardening is indeed world-wide, though the laurels to which we have alluded have chiefly been won by his artistic and picturesque creations of English garden scenery, pre-eminently "natural" and "English" in their style. In early life Mr. Marnock occupied the prominent post of gardener at Bretton Hall, then one of the best and most noted gardens in Yorkshire, and while here he contributed a competitive design for laying out the Botanic Garden at Sheffield, which was accepted; and this led to his being entrusted with the execution of the work, and to his appointment as the first Curator of the garden, now nearly fifty years ago. While he had charge of the Sheffield garden Mr. Marnock was the successful designer of another competitive plan for laying out the garden of the Royal Botanic Society in the Regent's Park, and this led to his removal to London and his establishment as Curator of the gardens in the Inner Circle about 1840. So clever was this design and so successfully was it carried out that the fame of the designer was assured, and thenceforward Mr. Marnock took place as one of the leading landscape artists of our time. The conclusion then reached has been fully borne out by the many works, public and private, which Mr. Marnock has subsequently carried out.

For some time after his removal from Sheffield Mr. Marnock was in business as a nurseryman at Hackney—at first alone, and afterwards in partnership with Mr. Mawley; but this was eventually given up, and his time was divided between his duties as Curator of the Botanic Garden, including his very successful management of the Regent's Park exhibitions, and the landscape works which he successfully carried out. In 1862 he gave up the management of the Royal Botanic Society's shows, and the exhibits and others, to the number of 153, presented him, at a dinner at the "London Tavern," with a testimonial, consisting of a tea service and other articles of plate, as an acknowledgment of his urbanity and integrity in his intercourse with them.

Though giving up his connection with the Royal Botanic Society Mr. Marnock continued to practise in his profession as a landscape gardener until 1879, when he retired in favour of Mr. J. F. Meston, who had been associated with him in the carrying out of many of his designs. On this occasion his friends and admirers subscribed to present him with his portrait, which was in due course carried out, the portrait being painted by Mr. Wiegmann, and presented with the following address, which is attributed to Canon Hole, who was one of the committee:—"We, the undersigned, on behalf of a large number of persons (although only a portion of those who would have joined us had we thought it desirable to give more publicity to our project) are authorised to express, on presenting you with your portrait, our high appreciation of your talents as an artist, and of your amiable qualities as a friend. Believing you to be the most successful landscape gardener of your time we congratulate you upon the great and beautiful work which you have done, and we trust the remembrance of the happiness which you have conferred on others will make you happier in your declining years. We pray that when these shall end in peace the faithful likeness which we now offer with affectionate respect may be a solace to those who are near and dear to you; and we know that not only will your memory be fondly cherished by those who may survive you, but that for many a generation the name of Robert Marnock will be remembered in those pleasant homes where he developed all the grace which Nature suggested, and where 'he made the desert smile.'" The surplus of the sum subscribed was expended on an original painting of one of Mr. Marnock's works, which was also presented to him.

Mr. Marnock has been intimately associated with the literature of horticulture. From 1839 to 1842 he was editor of the *Floralist Magazine*, a monthly periodical, and for several years, commencing with 1845, he edited the weekly *United Gardeners' and Land Stewards' Journal*.

The urbanity and gentle kindness which were ever the most conspicuous features of Mr. Marnock's character endeared him to all who came in contact with him; and few men, we imagine, who have filled

positions so important and responsible, have made fewer enemies or drawn about them so many friends. Of these personal friends those who know him best will be most fully appreciative. Of his works it may suffice to say they will be lasting monuments of his skill and taste. Mr. Marnock—who, we are happy to see, is in excellent health—has lately removed to London from Tonbridge Wells, where he pitched his tent for a time, one inducement, as we have heard him say, being the existence of a garden at his proposed residence laid out, in the style that most found favour with him, by the late Mr. Masters, of Canterbury.

HOME CORRESPONDENCE.

Examples of the Mild Winter in the Far North.—Although the weather for the past fortnight has not been of so genial a character as it was for some months previously, and while vegetation may be said to have sustained a decided check, there are still to be seen numerous instances of flowers peeping out afresh much earlier than their usual period of flowering. Amongst them may be mentioned *Wistaria sinensis*, which had some racemes of flowers full open on the 10th inst. *Ceanothus azureus* is also flowering in great profusion, having its shoots intertwining with large clusters of the scarlet flowers of the *Clinanthus*, lately described in the *Gardeners' Chronicle*. These three different kinds of flowers rambling over the south front of my house make a blend of colours worthy of adoption in a more favoured climate. *Magnolia conspicua* has also been flowering freely on a wall with east aspect for nearly a month, and scarlet and various coloured *Rhododendrons* have been flowering since the end of January. Another instance of the softness of climate in this locality is, I consider, worthy of mentioning in the flowering of *Marchal Niel* and *Gloire de Dijon* Roses growing on the south front of a farmhouse in the neighbourhood, and that without any assistance by way of protection. Upon visiting my friend, who is a keen amateur in gardening, about the beginning of April, I was astonished to find he had both the above-named Roses in full flower, while a succession of well-developed buds seemed in a fair way to keep up a succession. *J. Webster, Garden Castle.*

The Jodrell Laboratory at Kew.—A very few years ago there was literally no place in the United Kingdom where the physiology of plants was or could be adequately studied. Botany at that time consisted (so far as this country was concerned, or so far as public means for its prosecution allowed) simply in the identification by means of living or dried specimens of the so-called species, and their comparison one with the other by means of "characters," discernible by the naked eye, or by means of a lens. We do not for a moment undervalue these researches, nor do we forget what such a man as Robert Brown did, either in the identification of species or in the elucidation of the mysteries of plant life; the fact remains, however, that until these last few years there was not in the country any means where the ordinary student could, if he would, investigate those details of plant life which are comprised under the head of physiology. The public lectures and demonstrations afforded in the establishments to which students resort were confined mainly to the most superficial and ready means for the examination and study of what we may term outward morphology. But the time came when it was felt, and felt strongly, that the physiological side of botany should be more carefully and thoroughly investigated. The divorce of form and structure from the actual working of the organism could no longer be tolerated. In morphology and systematic botany this country was equal—and more than equal—to the task; but in physiology we were grievously behind-hand, and this in a country where the traditions of Hales and Priestley still existed, and where we pride ourselves on our practical habits, was a reproach beyond endurance. Even now if a student desire to undertake practical work in this department, he is almost compelled to betake himself to Germany, or other countries, where the necessities of study and research in this department of botany are more amply provided for. The establishment of the Jodrell Laboratory at Kew, an illustration of which we give above (fig. 80), and, better still, the work that has already been done in it, as recorded from time to time in these columns, go some way towards removing the reproach under which, and too justly, botanical science in this country has laboured. The laboratory is fitted up with means of study in the way of chemical and physical apparatus, which are sufficient for their purpose, and which we are glad to hear are being made use of to good purpose. It is to the munificence of Mr. Jodrell that the country owes the foundation of this laboratory, and it is mainly to the guiding zeal of the Assistant

Director, Mr. Dyer, that we owe its equipment and management. On another occasion we may advert more at length to the work already done and in progress in this establishment. Suffice it now to say that while the results already obtained are such as are creditable to British science, they are also of a nature to be ultimately of great practical benefit so far as the cultivation of plants and the comprehension of their life history is concerned.

Nelumbium luteum.—Looking into Mr. Robinson's *Sub-tropical Garden* I observe that he says that a plant lived in Paris in the open air for several years and flowered. Why should it not do so in England? Surely it would be worth a serious trial. *Alex. Nesbitt, Oldlands, Uckfield.*

Kennedya rubicunda.—When one sees this plant one is always reminded of the Australian Glory Pea, *Clinanthus Dampieri*, which used to be more common in gardens than it is now. I have seen the latter flowering beautifully upon an open wall in the month of May a few years ago in the quiet little village of Delgany, county Wicklow, but do not remember having seen any of the sort in England. The blue *Clinanthus* (*punicus*) I have not seen for many years, the last I remembering seen was at Duddingston,

free from insect pests. Under similar treatment, I have grown this *Primula* in London districts with the same success; in fact, so long as a frame becomes an essential in its culture, this *Primula* might be grown in any garden under these conditions. *L. Jenkins.*

Alexandra Park, Manchester.—A chance visit a few days ago to this favourite place of resort gave me the pleasure of a sight of the magnificent display of Tulips, which for many years has been a feature of this park in spring: this year's show is in no way inferior to those in previous years. The arrangement and shape of the beds have been previously described in your columns, and need not, therefore, be again specified. I shall merely, in the briefest manner, touch upon some of the best varieties which are here in bloom, and present the finest effect. Grand Duke, a golden-yellow, striped with red, makes a brilliant bed. The rose and white Cottage Maid is one of the finest of the light-coloured sorts. The deep red of Crimson King is remarkably fine, and equally so is the red and yellow of La Cour de France; Potter, a variety with violet flowers of great substance, and the best of its class; Proserpine, a rich silky-rose; Rosa Mundi, with flowers of a delicate rose; Sanson, bright crimson; Rose Griselin, rose and white, and Van der Helst, red and white, make excellent and effective beds.

FIG. 80.—THE JODRELL LABORATORY AT KEW.

near Edinburgh, in 1864. It covered the back wall of a greenhouse, and was under the charge of a "man of all work," until a change took place which gave the writer the opportunity of seeing the plant. But to return to the Kennedy, which makes a good climber: its flowers are both interesting in form and pretty to look at, which is more than can be said for a good many more creepers that are more frequently met with and more commonly grown. *W. J.*

The Double Crimson Primrose.—I note at p. 524 your correspondent "Alpha" speaking of this desirable old plant growing at the Newton Nurseries, Chester. In his remarks as to soil most fitting for the successful culture of the plant, "Alpha" advises that no manure of any description be used; but this must not be taken as the rule. When the original batch of this *Primula* was planted by me some three years ago, not only was an abundant supply of well rotted manure used, but during the growing season the plants were watered overhead with liquid manure thrice weekly, and which I have no hesitation in saying had a most beneficial effect on the plants, judging by their rampant growth and the multiplicity of crowns. With "Alpha's" other remarks I fully agree—it should never see a ray of sun or feel the frost, and it must be kept incessantly moist; these are in my opinion the greatest essentials to success, and the latter the surest means of keeping the plants

The grand effect produced by 50,000 bulbs judiciously planted may easily be imagined, and Mr. Manderson's taste in this department is not surpassed. It is noticeable that a few of the beds have suffered in the following manner:—The shoots grow an inch or two in height, and then decay without appearing above the ground, the bulb remaining sound. Mr. Manderson ascribes it to the frosts. In other respects, also, the park looks well, the trees bursting into leaf and the lawns presenting a most healthy appearance. The houses are filled to overflowing with bedding-plants in grand condition, waiting for the genial warmth of May to take their place for the admiration of thousands during the summer months. *A.*

The Introduction of the Cedar of Lebanon.—A paragraph in an article on the "Travels of Plants" in the *Gardeners' Chronicle* for March 25, just received here, calls up a reminiscence. Here is the paragraph:—"The introduction of the Cedar of Lebanon into France was an effort of most interesting devotion on the part of Bernard de Jussieu, who brought it from the Holy Land in 1737, and kept it alive on the voyage by sharing with it the very small quantity of water which he received during a prolonged voyage. In the absence of a flower-pot, Jussieu is said to have planted the Cedar in his hat, and by giving it a moiety of his daily glass of water he succeeded in keeping it alive, and afterwards had the

satisfaction of planting it in the Jardin des Plantes at Paris. In 1837, at the age of 100 years, it was cut down, having attained a height of 80 feet." I dimly remembered having read this narrative before in a fuller version. This is to be found in an article on coniferous trees in the *Edinburgh Review* for October, 1864. That account enters into details—that Bernard de Jussieu, when travelling in the Holy Land, brought away with him from among the Cedars of Mount Lebanon a little seedling, made a flower-pot of his hat, in which he planted it, got it safely to Marseilles, and that Marseilles, that tempestuous weather and contrary winds so prolonged the voyage that the passengers were restricted to half a glassful of water a day all through a lengthened voyage; that, sharing this with his little plant, he reached Marseilles at length with his own health seriously damaged, but that of his seedling uninjured; that, after all this privation successfully endured, he came near to losing the fruit of his devotion through the incredulity and suspicion of the officers of the Customs, who, suspecting a scheme for smuggling jewels, wished to unearth this treasure from its singular receptacle: how, his eloquent appeals prevailing, he was allowed to carry it to the Jardin des Plantes, where it became a great and famous tree; and, finally, how, "in its hundredth year (1837) it was cut down to make room for a railway, and now the hissing steam-engine passes over the place where it stood. I had supposed it was well known that Bernard Jussieu never went to the Holy Land, and that most readers of the *Gardener's Chronicle* would know that no railway has as yet invaded the Jardin des Plantes, or that in such a case it would be likely to cross the steep knoll, upon which still stands (or last summer stood) the Cedar of Lebanon which, as a seedling, Jussieu is said to have brought over from England in the crown of his hat, said hat the while probably covering the honoured head of the founder of the great system, it is hardly to be wondered while to enquire where the penny-a-linger of the *Edinburgh Review* obtained his materials, but the story of the voyage from the Levant to Marseilles seems to be an adaptation of one about three Coffee plants which Antoine de Jussieu is said to have despatched from the Jardin des Plantes in 1720 to Martinique in a vessel commanded by Captain Declieux, one of which was kept alive by the devotion of the captain, under circumstances similar to those of that part of the preceding story, *Asa Gray*.

Tropæolum Hermosa Grasshoff.—This is the best dwarf-growing double flowering Nasturtium that I am acquainted with. The flowers, of which I send you a few, are crimson, and when fully expanded, measure nearly 2 inches in diameter, and are produced in profusion, and well above the foliage. As a conservatory basket plant with the shoots trained loosely round the sides and bottom of the baskets and depending therefrom, or grown in 45-pots for embellishing the entrance of the staging with the depending shoots hanging gracefully over the edge of the stage, the effect is very striking, and on this account, as well as by reason of its easy culture, every one possessing a greenhouse should grow the subject of this notice. *H. W. W.*

Tucking Them In.—When careful housewives find the frocks of the youngsters too long they usually get over the difficulty by running tucks in them. And there are many things in the world besides the garments of the juvenile members of the community that may happen to be above regulation length, and on which it is possible to practise tucking-operations. Amongst these the leaves of exhibition *Hyacinths* may now be numbered. Those who have any knowledge of this favourite flower know that in addition to large, well-developed spikes composed of full-sized flowers—the spikes sufficiently drawn out to prevent crowding, yet not beyond this—nicely balanced foliage is indispensable, the points of the leaves coming little if at all above the base of the spike; for if, as often happens, the leaves are long, reaching so high as to partially hide the flowers, there is a want of proportion that mars the appearance of the plant. Therefore, the condition of the foliage is always an important consideration with judges. Knowing this, an exhibitor at one of the leading provincial shows recently held, who had got his *Hyacinth* leaves too long, set to work to rectify the defect by tucking them in. The manipulation might have passed muster as a not badly-executed piece of deception, for there was nothing to show that the leaves had been in any way tampered with, the surface of the pots being nicely covered with moss, yet it did not escape the notice of the judges that the leaves looked a little too regular, and felt slightly soft to the touch; but, in the hurry caused by the too limited time usually allowed to get through the work, so that the public may be admitted at the stated time of opening, they made the award in accordance with the arrangement which the competing groups presented, the ingenious exhibitor taking 2d with twenty-four, and 1st with twelve. After the schedule had been gone

through the judges had a little breathing time, and they thought it would be as well to have a closer look. Turning a few of the doubtful plants out of the pots the way they had been managed was at once seen: the upper half of the soil the pots contained had been taken out, and each leaf bent right back close down to the bulb as low as admissible without detaching it from the bulb; the points were then turned up to what the operator no doubt looked upon as the right length for them to appear, tucking the spare portion below the surface, and then carefully replacing the soil, which was pressed in, rounding it over the bulbs so as to bring the leaves close up to the base of the flower-stems, and finishing off with the usual covering of moss which tidy exhibitors use to give a trim appearance. Without the tucking-in performance the leaves would have three-fourths hid the spikes. It is needless to say both collections so improved were disqualified, the exhibitor in place of prizes gaining a notoriety which is not unlikely to stick to him [And which will we trust, secure his exclusion from similar competitions in future. Ed.] *T. E.*

Berberis Darwinii.—I observe that one of your correspondents suggests that *Berberis Darwinii* should be placed in a sheltered position, my experience leads me to think that this is a mistake. I have here many planted in the front rank of shrubberies, and a few in the open ground. Those in the open are incomparably finer both as regards growth and flowering. One of the former, about 7 feet high and 8 to 9 feet in diameter, is simply a mass of bloom, the leaves being almost entirely hidden, and the amount of bloom is very nearly equal on every side of the shrub. This is entirely unexpected, and quite isolated. Those in the shrubberies, on the contrary, are stalky, one-sided shrubs, with not one-hundredth part of the amount of bloom which is to be seen on the isolated example. *Alx. Nesbitt, Oldlands, Uxbridge.*

New Potatoes.—In reply to "A. D." of last week, *Englishman*, *Fluke* and *Crowwell*, were sent out (season 1881) by Messrs. Benjamin Kerr & Co., of Aberdeen; *Adirondack* and *Queen of the Valley* were sent out (spring, 1881) by Messrs. Kerr & Fotheringham, of Dumfries. At the International Potato Exhibition last year prizes were offered, Class F, for three dishes of distinct new varieties in commerce, not offered to the public before season 1880, to include one dish of *Matchless*; and if "A. D." will turn to the report of that exhibition he will find *Adirondack* and *Queen of the Valley* a very prominent position in that class; and besides they were also shown in many of the other competing collections; thus proving that they were in commerce to no mean extent. I hope "A. D." will now be convinced that my corrections were needed, as it would be very injudicious to exhibit these varieties again in 1882 as *novæ fide* new varieties of this year, which they are not so. My correction of "A. D.'s" list of new varieties was only so far as I knew positively; I am not sure but that the list might be farther corrected, and will gladly assist "A. D." if he communicates with *W. Kerr, Dargavell, Dumfries, N.E.*

Calceolaria bicolor.—This old and seldom seen plant is now in fine condition in the Newton Nursery, Chester (James Dickson & Sons), where other true species are grown—now seldom to be seen. The plant is grown in a 12-inch pot, and has twelve fine corymbs of bloom, and I believe one was recently taken from the plant with 225 spikes or single flowers forming the corymb. It is one of the most useful plants I know, and one of the best for late autumn flowers. Old varieties of plants long since passed out of general cultivation appear to be a speciality of this nursery, as I frequently see old friends which I thought had departed years ago. *Ebor.*

An Early Peach.—*Mr. Rivers*, of Sawbridge-worth, sent me some early Peach trees at the beginning of this year, among which was one called *Alexander*, which produced perfectly ripe and nicely flavoured fruit on the 19th and 20th of this month, just fifteen weeks from the time I received the tree. As this tree is making good wood I hope next year to have ripe fruit on it by the middle of March. *S. M.*

The Fruit Prospect.—It seems fall early to say much of fruit prospects as yet, but from present appearances there will be an abundance of cherries and plums, as trees of both these have been laden with blossoms, and these, so far, have set well, and seem to be uninjured by the cold and rather sharp frost that occurred on the night of the 15th, when the glass ran down to 25°, and for several days after the wind was keen and cutting. These stinging winds have told on Peaches and Nectarines, the latter especially, whose growth, on east walls, where they have been more exposed to the weather. The fruit set well, but in the absence of sun, and so much

cold prevailing, they have been unable to swell, and unless an immediate favourable change takes place, numbers will fall. Apricots are very full, and have had to be thinned severely, and as the fruit is now getting forward and well covered with foliage, it may, I think, be regarded as safe. Peas and Apples must be thin in most places, and more particularly those where the trees had much of a load last year, as all these are only showing a very few blossoms. Gooseberries and Currants, unless we have frosts sharper than any yet this spring, will be laden, as they are set and swelling fast, and Strawberries are full of promise, the crowns looking fat and strong, with big trusses bursting out, and the plants furnished with leaves more as they generally are in May or June than at this early season. The wood of Figs is completely studded with fruit, as they appear at every joint, and unless we get a cold May to throw them off the crop will be such as we have not seen before. Taking one thing with the other, the outlook is altogether a cheering one for gardeners and market growers, who depend so largely on the harder fruits for returns, will have reason to rejoice, as the harvest for them is likely to be a full one, and it is earnestly to be hoped that it may be so, as they have had a most trying time of it lately. *T. S.*

Vinca variegata.—I can fully endorse the remarks made about this beautiful and useful plant. I wonder that it is not more extensively grown, as winter and summer alike it is always good. As a bed it forms a most elegant object, especially at this season, the silvery foliage and the delicate blue of the flowers contrasting so well especially in the shade, and in or near a dark background. I have a bed of it planted about four years ago which is now a perfect picture, the new foliage and mass of flowers being better and more plentiful than I have ever seen them before. Another thing in its favour, that it is so little trouble to keep in order, the only thing we do to it being to clip it in the autumn to keep it from encroaching on the grass; and now every shoot is erect and studded with flowers, as the mass forms a complete semi-circle about 21 feet in height in the centre. The bed is an oblong about 20 feet by 5 feet. I should think some circular masses in a large garden would be very telling objects. I find it does best if planted where it can remain a few years, as it throws up more and stronger shoots from the crown every year. *Chas. Clark, Trevano Gardens, Helston, Cornwall.*

The April Showers and the Fruit Crops.—The former have not only nourished but revealed the latter, stimulated by the forcing rains, the fruits have grown beyond their leafy coverings, and are now (April 24) visible. The progress they have made during the last fortnight, notwithstanding the keen winds and frosty nights, has been very great. The results, too, so far, seem to be satisfactory, when Peaches, Apricots, and Nectarines promise a fine crop. No doubt some have been frosted off in low-lying localities, but, as a rule, most of them have escaped. So far, Apples and Peas are only just coming into flower, in a few individual trees. Both being out. Cherries are also in full bloom, and promise an abundant crop. Gooseberries and Currants have set well and are swelling fast, and seem a full crop. We have had several smart hail-storms to-day, and these generally precede sharp frosts at nights, and altogether colder and harsher weather; besides this, hail itself does great damage to young and delicate fruit. Its weight bruises, its intense coldness seems to remain long enough in contact with the fruit to chill it; still, as the wind is south-westerly, it is hoped we may soon see the last of the hail, and that the leaves and fruit will soon have advanced so far as to be safe against weather. The earth is seldom dry at this season, and yet at no time does rain foster growth more rapidly than in April. The rain generalises the air and moistens and softens the soil, and the lower and younger fruits, and these respond to its touch at once, in leaps and bounds forward. This has been an exceptionally good seed time, and notwithstanding the bad harvesting weather of the past autumn our seeds so far promise well. The main crops of Onions, Carrots, Parsnips, Peas, Brassica, &c., are well up and growing freely. Early Potatoes have not come so quickly as usual, and Asparagus is thin—only a few leaves have shown here up to this date. But of course everything depends on sets and soil in regard to such crops. Both are cold here, which makes all the difference. Broccoli have come in well, but are generally rather smaller than usual; however, after the wholesale clearances of the past few winters they have been welcome of any size. *T. T. F.*

MR. JOHN KELLY, Gardener to the Earl of Hope-town, who is about to leave his situation in May, has been presented by the under gardeners with a handsome vase containing, as a token of the high estimation in which he has been held during his stay there.

Reports of Societies.

Royal Horticultural. April 25.—Dr. Maxwell T. Masters in the chair. The lecturer on this occasion was Mr. Shirley Hibberd, the substance of whose discourse on the Auricula will be found at p. 560. The display of the National Auricula Society, reported below, was the all-absorbing feature of the day, but there were a few groups of other plants that must not be overlooked by us. First we give credit to Mr. Barron for as pretty a little group as we have ever seen from Chiswick, consisting of dwarf standard Azaleas, Marguerites, and erect-flowering Gloxinias, carpeted with Ferns and Lycopods. Messrs. James Veitch & Sons contributed a group of standard Roses in pots that have never been equalled in quality, every plant being excellent in foliage and flowers (see p. 566). A Silver-gilt Flora Medal was awarded. Mr. Wm. Paul & Son, Waltham Cross, contributed a beautiful group of half specimen Roses, including well-flowered examples of Countess of Rosebery, Magna Charta, John Hopper, Prie de Waltham, Etienne Levet, La France, Duke of Edinburgh, and others; and to it a Silver Flora Medal was awarded. To a pretty group of Clematises from Mr. C. Noble, Bagshot, a similar medal was voted, as also to a collection of pot Roses from Messrs. Lane & Son. To C. Brown, Esq., Grosvenor House, Gunnersbury, a Silver Banksian Medal was awarded for a group of nine beautiful forced Indian Rhododendrons and a good plant of *Lycaste Harrisoniae*. Mr. B. S. Williams sent a choice group of *Amaryllis*, &c.; Captain Patton, a collection of Tulips; Messrs. Barr & Sugden, another choice assortment of *Daffodils* and other spring flowering plants; Messrs. Cannell & Sons, a group of plants of *Primula Sieboldii*, and another of an exquisite variety of the white *Parietaria*; *Chrysanthemum frutescens*; and Mr. G. W. Piner, Uckfield, a very choice lot of cut blooms of Tea Roses. Bronze Banksian Medals were awarded to each.

SCIENTIFIC COMMITTEE.—Sir J. D. Hooker, in the chair.

Larch leaf-miner.—Mr. MacLachlan read a paper on a diseased condition of the Larch, brought about by the attacks of the larva of a small grey moth, *Coleophora laricella*. The female lays her eggs on the twigs or buds of the Larch, and the larvae when hatched in the autumn construct for themselves cases of the cuticle. The young autumn larvæ attach their cases to the young leaves in spring and mine the leaves, causing the shoots to assume a blanched appearance. Mr. MacLachlan believed that owing to the regulating influence of insectivorous birds, such as titmice, the damage done to the plantations was not very serious in the long run; and referred in illustration to the attacks of a similar larva (*Cemostoma laburnella*) on the leaves of Laburnum, which although they caused great disfigurement of the leaves, and to that extent weakened the trees, did not seriously injure the trees. It was difficult to suggest a practicable remedy, but the smoke from burning rubbish on the windward side had been recommended.

***Gentiana verna*.**—Mr. G. F. Wilson showed flowers of this exquisite plant, some of which had been grown in ordinary soil destitute of lime, and others under exactly the same conditions except as to the presence of lime. It was manifest that the flowers grown without lime were of a darker blue, while those with lime were paler azure-blue with a white eye. The plants on the lime produce not only paler, but earlier blue flowers, but are more vigorous and free-flowering than when the lime is absent. [See an article on the distribution of alpine plants according to the nature of the soil, at p. 238, August 20, 1881. Ed.]

Fertilisation of *Hoya glabulosa*.—Mr. W. G. Smith referred to this subject, and exhibited *Hoya* flowers with flies attached to the glutinous discs of the pollen masses. This *Hoya* is highly fragrant; this fragrance is very attractive to insects, and it is by insect agency alone that the flowers can be fertilised in a state of nature. The flowers of *Hoya* differ from Orchids in their perfectly regular form, but they agree somewhat in their pollen grains, which are grouped in masses of two and placed in five small pouches. The five little glutinous dark coloured discs, belonging to the bases of the pollen-masses, are the only parts visible in the open flower. In *Hoya* there are five pairs of pollen-masses arranged regularly round the centre of each flower. When insects alight on the disc (attracted by the powerful fragrance) it almost invariably happens that one foot slips and gets caught by one of the five little glutinous discs. In the effort of the insect to escape, two, three, or even four of its other feet are almost sure to get similarly caught. The insect then tries with all its power to free its limbs, and if these efforts are successful the pollen masses are drawn out of the pouches with the feet. The basal appendages of each pair of pollen masses are elastic, and

when in the pouch they are like an extended spring, but the instant the masses are drawn out by the insect's foot the spring closes, the two pollen masses quickly cross each other and hold tightly on to the insect's little claws. If the insect is weak it cannot withdraw its legs at all, and so perishes in the flower; but if strong it flies away with one to five pairs of

FIG. 90.—FERTILISATION OF HOYA.

Flower with fly attached by four of its feet (a) to the glutinous discs of the pollen masses; a shows one foot free, with one pair of pollen masses fixed by its glutinous disc (see further enlargement below); c, the combined pistils and stamens (gynostemium); d, stigma; e, furrow, or pouch, with pollen masses beneath, and viscid disc emerging (see figure below), enlarged 4 diam.

pollen-masses clasped round its feet. Sometimes an insect breaks part of a leg off in its efforts to escape. The five stigmas are not ready to receive the pollen at the time the pollen is ripe, so that it is only when the insect re-slights on to some neighbouring *Hoya* flower in a different stage of growth that cross-fertilisation takes place.

FIG. 91.—FERTILISATION OF HOYA.

Upper figure:—The pollinia within the furrow. a, Glutinous disc; b, Elastic appendage of pollen mass; c, Pollen mass. Lower figure:—Part of a fly's leg with pollen masses attached. The row of larger cells near bottom edge is petaloid.

Rhododendrons.—Numerous cut specimens were shown and commented on by Mr. Mangles. From the Royal Gardens, Kew, came a truss of *Rhododendron Aucklandi* (or *Griffithii* var. *Aucklandi*) for comparison with a hybrid variety to be mentioned hereafter; flowers of *R. Maddeni*, a very fragrant form, which has the merit of blooming when in a small state; and a magnificent truss of *R. Broughtonii*. Mr. Mangles showed a hybrid of his own raising named *Alice Mangles*, a very beautiful form, with bold oblan-

ceolate leaves, and a magnificent, but rather loose conical truss of large lilac nodding bells about 4 inches in diameter, 6-lobed, and each supported on a long spreading stalk. It was raised from the pollen of *R. Aucklandi* and the stigma of *R. ponticum*. The calyx, which in *Aucklandi* is broadly and irregularly cup-shaped, with shallow lobes of which two are much larger than the others, was here 6-lobed, and the twelve stamens of unequal lengths. *R. edinense* ×, raised by Mr. Anderson Henry from *R. Henryanum* ×, crossed with the pollen of *R. Nuttallii*, *R. Henryanum* itself being a hybrid between *R. Dalhousiae* and *R. formosum*.

An unnamed hybrid of great interest and no little beauty was also shown by Mr. Mangles, who raised it between *Azalea mollis* as the male parent and *R. ponticum*. It has something of the foliage of *A. mollis*, but evergreen; the flowers are borne in a terminal raceme with long ascending stalks; the corollas, which measure 2½ inches across and which otherwise are like those of *R. ponticum*, are slightly hairy, as in *Azalea mollis*. The stamens are ten, filaments declinate of unequal length.

R. Dalhousianum, with greenish-yellow flowers of the fashionable tint facetiously described as "Greenery-yallery Grosvenor Gallery," the species as growing wild in Sikkim, and as figured in Sir Joseph Hooker's *Rhododendrons of Sikkim Himalaya*, being wild.

A hybrid between *R. campylocarpum* male and *R. John Waterer*, with the form of flower of the former, with something of the colour and markings of the latter.

R. glaucum, with small rose-pink flowers in a dense truss, and with a strong aromatic perfume.

A hybrid between *R. Henryanum* × (above described) and the pollen of *R. Edgworthii*.

R. Thomsoni, with the blood-red tubular flowers supported by a large entire cup-shaped calyx. From Captain Rogers, of River Hill, came *R. Falconeri*, with purplish flowers, a 6-lobed corolla and twelve stamens. From Mr. Luscombe (gr. Mr. Dave), came trusses of *R. Fortunei*, supposed to be crossed with *R. Thomsoni*, but the parentage, so far as the latter species is concerned, was not obvious.

Mr. Mangles also showed flowers of a hybrid raised in Mr. Parker's nursery at Tooting, between Countess of Haddington and *R. Edgworthii*. The flowers are large, tubular, white, with a dash of lemon at the base, and sweet-scented.

R. chamecistus, a dwarf alpine lime-loving species, with charming pink flowers. (See p. 258.)

FLORAL COMMITTEE.—G. F. Wilson, Esq., in the chair.—But few new plants came under the notice of the members at this meeting, the most important being *Masdevallia imperialis* from R. Warner, Esq., apparently a variety of *M. Lindenii*, with very broad segments, and of the same colour; *Gymnogramma Lauchena grandiceps*, from Messrs. Dixon & Co., a Fern with bipinnate fronds, the ultimate segments rounded, and the terminal ones much crested, the frond being densely covered, especially on the under surface, with yellow bloom; *Abubertia violacea*, from Mr. K. Dean, a plant desirable for its dwarf habit, and very deep violet flowers; *Calceolaria bicolor*, from Messrs. James Dickson & Sons, Chester, a pretty and curious variety, with the upper half of the flower white, and the lower half clear canary-yellow; *Azophila Rebecke*, from Mr. W. Bull, a tropical Australian Tree Fern, with slender stem, oblong bipinnate fronds, the rachis clothed with black scales; a remarkably fine specimen of *Masdevallia Lindenii* var., from Mr. T. Horsman, Hbley; a new, very fine, large white bedding *Viola*, named Mrs. Laing, and a clear yellow bedding *Pansy* named Mrs. J. Llewellyn, both from Mr. H. Hooper, of Bath. The following awards were made:—

First-class Certificates.

- To Mr. R. Warner for *Masdevallia imperialis*.
- To Mr. W. Bull, for *Azophila Rebecke*.
- To Mr. H. Hooper, for Bedding *Viola* Mrs. Laing.
- To Mr. H. Hooper, for Bedding *Pansy* Mrs. Llewellyn.
- To J. H. Mangles, Esq., for *Rhododendron Alice Mangles*.
- To Mr. R. Dean, for *Abubertia violacea*.
- To Messrs. Dixon & Co., for *Gymnogramma Lauchena grandiceps*.

Cultural Commendation.

- To Mr. T. Horsman, for *Masdevallia Lindenii* var.

FRUIT COMMITTEE.—John Lee, Esq., in the chair. Mr. Lyon, gr. to Sir E. Scott, Southridge Court, showed at this meeting a beautiful dish of Keen's Seedling Strawberries, and received a Cultural Commendation. Mr. W. Gallop, Bradford Deverell Gardens, H. Doncaster, sent a scarlet-fleshed Melon, of fairly good flavour for the time of year. Mr. A. Harding, Orton Hall Gardens, Peterborough, sent four varieties of Apples; and examples of the John Apple, a very small variety, juicy, and good in flavour, came from Chiswick.

National Auricula (Southern Section).—The

annual exhibition of this rising Society, held at Kensington on Tuesday, was the largest and best as regards all-round quality, that has yet been held in the South, and we should much question if any very greatly superior in these respects have been seen in the North. The autumn growth of the plants taking place at a time when there was so much moisture about caused many a plant to throw up autumn trusses, a result that bodes ill for the spring bloom; but the winter in the South was kind to the Auricula—there being neither frost, and a genial spring brought them on well, but too fast for those intending to compete, and the best of the blooms were over at least ten days ago. Mr. Douglas, generally a successful competitor, could not get near the head of the prize list, so that the Northern men, on this occasion at least, had matters all their own way. Amongst the Lancashire and Yorkshire friends present were the Rev. F. D. Horner (still with the Auricula *facile princeps*); Mr. Gorton, Eccles; Mr. Barlow, of Stakehill, Castleton; Mr. Pohlman, of Halifax; Mr. Woodhead, of Halifax; Mr. Bolton, of Warrington, and right well they held their own. For the Southern growers Mr. Douglas, Mr. Turner, and Mr. Llewellyn did well; and we note a welcome addition to ranks of the fancy in the person of Mr. Cannell. The names of the prize-winners and the successful flowers are given below. The seedling flowers of the show were more numerous and very good, showing steady progress, as was exemplified by the number of First-class Certificates awarded. In the green-edged class the Rev. F. D. Horner gained the 1st prize with Agamemnon, a large, bold flower, with fine orange tube, dense and pure paste, broad, dark ground colour, and well defined green edge. Mr. J. Douglas was 2d with Jumbo, a good green with very smooth and rounded petals, good paste and fine yellow tube. Both of these received First-class Certificates. The green-edged class showed a good number of really fine flowers. Mr. Douglas gained the 1st prize with Mrs. Moore, a large, finely rounded flower, with a good round yellow eye, broad ground colour, with grey edge. Bluebell, from the Rev. F. D. Horner, gained the 2d prize; it is quite unique, having a pale eye, very fine paste, blue ground colour, and silvery-grey edge, and fine mealed foliage. George Rudd (Woodhead), shown in this class, has the mealed foliage and pure paste, contrasting well with the black ground colour, the edge is rather narrow, but the flowers are very round. Luna (Horner), a well proportioned flower, was well shown in this class; it has a black ground colour with fine smooth edge. All of the above took First-class Certificates. In the white-edge class Mrs. Dowell (Woodhead) is a very pure white of the Smiling Beauty type, with mealed foliage; it received the 1st prize and a First-class Certificate. The Rev. F. D. Horner was 2d with Grey Horn, a flower of the John Simonite type; it has a very pure white edge, with a nicely rounded petal. In the self-edged class the 1st prize was awarded to Mr. E. Pohlman, of Halifax, for a very fine dark flower with a large truss supported on a stout stem. Mr. Douglas came in 2d with Duke of Albany, a flower with smaller truss but very dark well-rounded petal and round pure paste. Mr. Pohlman's flower also received a First-class Certificate.

In alpins there was a good assortment of new flowers from Mr. Turner and Mr. Douglas principally. In the yellow-centred class Mr. C. Turner gained the 1st prize with Amazon, a large flower of the finest quality, with maroon edge, shading to red. Mr. J. Douglas was 2d, with Princess of Waldeck, maroon edge, shading to reddish-crimson, smooth petal. Mr. Douglas also exhibited in this class Amelia Hardwidge, a neat and fine flower, shaded to reddish-crimson; this, with the two others, received First-class Certificates. In the cream or white centres Mr. Turner was 1st, with Charles Darwin, a very round smooth variety, with yellowish-cream centre and plain purple shaded edge. Mr. Douglas was 2d, with Ada Hardwidge (Douglas), a neat and pretty flower, of small size, cream centre, and reddish-purple shading.

The prizes were awarded as follows:—

TWELVE AURICULAS, DISSIMILAR.—1st, the Rev. F. D. Horner, Kirkby Malzeard, with Excelser (Horner), green-edged; Agamemnon (Horner), green-edged; and Luna (Horner), white-edged. 2d, Mr. J. Douglas, with Moonlight (Horner), grey-edged; Frank Simonite (Simonite), white-edged; Mrs. Douglas (Simonite), violet self; John Simonite (Walker), white-edged; Heroine (Horner), plain coloured self; George Lightbody (Headley), grey-edged; Alex (Horner), and Lana (Horner), both grey-edged. 2d, Mr. E. Pohlman, Halifax, with Garibaldi (Pohlman), dark self; Beauty (Trail), grey-edged; Sophia Dumaresque (Lightbody), white-edged; Blackbird (Spalding), self; George Lightbody, Confidence (Campbell), green-edged; and Alexander Meiklejohn (Kay), grey-edged; Prince of Greens, Brunette (Pohlman), a fine black self; Colonel Taylor (Leigh), green-edged; and Acme (Read), white-edged. 3d, Mr. T. Woodhead, Shuben Head, Halifax, with Acme (Read), Heroine (Pohlman), self; Colonel Taylor (Leigh), Emperor (Liton), green-edged; Mrs. Dowell (Woodhead), a white-edged seedling; George

Rudd (Woodhead), a grey-edged seedling; Prince of Greens (Trail), Neat and Clear (Woodhead) a dark self seedling; Charles Turner (Woodhead), a seedling grey-edged; Shibusen Beauty (Woodhead), a seedling self; and John Simonite (Walker), 4th, Mr. J. Douglas, gr. to F. Smith, Esq., a seedling self with Freedom (Woth), green-edged; a seedling grey-edged (Douglas); Pizarro (Campbell), self; Blackbird (Spalding), Ne Plus Ultra (Smith), white-edged; Charles J. Perry (Turner), purple self; Lancashire Hero (Lancashire), green-edged; Smiling Beauty (Heap), white-edged; Prince of Greens (Lancashire), white-edged; Heroine (Pohlman), green-edged; and Acme (Read), J. T. D. Llewellyn, Esq., Penitence, Swansen, and Messrs. Cannell & Sons also competed.

SIX AURICULAS, DISSIMILAR.—1st, the Rev. F. D. Horner, with John Dultrey (Horner), a seedling grey-edged; Heroine (Horner), Prince of Greens (Trail), John Simonite (Walker), Miranda (Horner), white-edged; and Geo. Lightbody (Headley), 2d, Mr. T. Woodhead, with Prince of Greens (Trail), C. J. Perry (Turner), Lancashire Hero (Lancashire), Grey Lightbody (Headley), Acme (Read), and Col. Taylor (Leigh), 3d, Mr. J. Douglas, with Dr. Kidd (Douglas), white-edged; C. J. Perry (Turner), Smiling Beauty (Heap), Geo. Lightbody (Headley), Lancashire Hero (Lancashire), and a green-edged seedling, 4th, Mr. Pohlman, with Heroine (Horner), Grey Lightbody, Lancashire Hero (Lancashire), Col. Taylor (Leigh), Confidence (Campbell), Acme (Read), and a seedling self, 5th, Messrs. Cannell & Sons, with Beauty (Trail), Col. Channepys (Turner), grey-edged; John Waterston (Cunningham), grey-edged; Vulcan (Simonite), dark self; and True Briton (Hepworth), and True Briton (Hepworth), white-edged. 6th, J. T. D. Llewellyn, Esq., with Alderman Wisbey, green-edged; Imperator (Liton), Corona (Llewellyn), a seedling purple self; Unique (McLean), grey-edged; Talisman (Simonite), and Metropolitan, self.

FOUR AURICULAS, DISSIMILAR.—1st, R. K. Penon, Esq., Dinham, Ludlow, with Eliza (Sims), self; Frank Simonite (Simonite), Lancashire Hero (Lancashire), and Geo. Lightbody (Headley), 2d, Rev. E. F. Fellows, with Temple (Keay), Royton, and Mr. Horner (Read), grey-edged; Lord Clyde (Lightbody), self; Lancashire Hero (Lancashire), and True Briton (Hepworth), 3d, Mr. R. Gorton, Gildarook, Eccles, with Pizarro (Campbell), Lovely Ann (Oliver); Frank Simonite (Simonite), and True Briton (Hepworth), 4th, Mr. J. M. Robing, with White Rose (Leitch), and Maria (Chapman), grey-edged; Admiral Napier (Campbell), Duke of Argyll (Campbell), self; and Geo. Lightbody (Headley), 5th, Mr. T. File, Southern Hill, Reading, with Smiling Beauty (Heap), Mrs. File (File), a dark self; C. E. Brown (Headley), and Anna (Trail), green-edged. 6th, Mr. W. Brockbank, Brockhurst, Didsbury, with Alma (Lightbody), grey-edged; Metropolitan (Spalding), Lovely Ann (Oliver), and Reliance (Mellor), white-edged.

TWO AURICULAS, DISSIMILAR.—1st, R. K. Penon, Esq., with Lancashire Hero (Lancashire), and Geo. Lightbody (Headley), 2d, Mr. W. Bolton, Warrington, with Geo. Lightbody, and Kingdove (Horner), 3d, Mr. W. Brockbank, with Garibaldi (Pohlman), and Frank Simonite (Simonite), 4th, Rev. E. L. Fellows, with Lady Hero and the Ultra (Simonite), 5th, Rev. H. D. Ombrian, with Lancashire Hero and an unnamed grey-edged. 6th, Mr. Samuel Barlow, Stakehill, Castleton, with a seedling self and Queen Victoria, grey-edged.

SINGLE SPECIMEN AURICULAS.—Green-edged: 1st and 2d, Rev. F. D. Horner, with Prince of Greens (Trail), and Colonel Taylor (Leigh); 3d and 4th, Mr. Woodhead, with Colonel Taylor and Imperator (Liton); 5th, Mr. Brockbank, with Prince of Greens; 6th, Rev. F. D. Horner, with Talisman (Simonite); 7th, Mr. Bolton, with Colonel Taylor; 8th, Horner, with a pair of raiser and exhibitor not stated. Grey-edged: 1st, 2d, and 3d, R. K. Penon, Esq., with George Lightbody (Headley); 4th and 6th, Mr. Pohlman, with George Lightbody; 5th, R. K. Penon, Esq., with E. Brown; 7th and 8th, Rev. F. D. Horner, with George Lightbody. White-edged: 1st, Mr. Woodhead, with Acme (Read); 2d, Mr. Douglas, with Silvia (Douglas); 3d, Mr. Pohlman, with Acme; 4th and 5th, Trail's Beauty, exhibitors unknown; 6th, a seedling, exhibitor unknown; 7th, Rev. F. D. Horner, with Blue Bell; 8th, R. K. Penon, Esq., with Smiling Beauty. Self: 1st, Rev. F. D. Horner, with Kingdove; 2d, Blackbird, exhibitor unknown; 3d, Mr. Douglas, with Topsy (Kay); and 4th, with Campbell's Pizarro; 5th, Pohlman's Garibaldi; 6th, Amelia Hardwidge, a bright pink shaded flower; 7th, Amelia Hardwidge, a prettily shaded, and several fair seedlings of his own raising; and Sensation and Dolly Varden (Turner), Mrs. Meiklejohn (Meiklejohn), and Duadem (Gorton).

SIX ALPINE AURICULAS.—1st, Mr. James Douglas, with Mrs. Meiklejohn, Didsbury, Amelia Hardwidge, and a seedling, all red shaded; and George Lightbody (Turner), and Sensation (Turner). 2d, Mr. Turner, with King of the Belgians, Unique, William Fowle, Sensa-

tion, John Ball, and Gertrude, the last four all being self flowers, 3d, Rev. E. L. Fellows, with, amongst others, King of the Belgians, very fine; and a good rich chestnut self seedling, 4th, J. T. D. Llewellyn, Esq., Mr. R. Dean, Ealing.

SINGLE SPECIMEN ALPINES: GOLD CENTRE.—1st, Mr. Turner, with Amazon, reddish-magenta shaded; 2d, and all the other prizes, Mr. Douglas with a magenta shaded seedling, Amelia Hardwidge and King of the Belgians.

WHITE OR CREAM CENTRE.—1st, Mr. Turner with Charles Darwin, a charming plain shaded flower, and 2d with Mentor, dark purple shaded; 3d and 4th, Mr. Douglas with Queen Victoria (Turner), mauve-purple shaded; 5th, Mr. Turner with Gladiator, violet shaded; 6th, Mr. Douglas, with Geo. Lightbody (Turner).

PURELY DISSIMILAR ALPINES.—1st, Mr. Samuel Barlow, with nine pale hued or yellow show kinds, the double yellow and purple and a show green-edged kind that can hardly be termed fancy. 2d, Mr. Douglas with buff and greenish ground flowers which were decidedly fanciful; and 3d, Mr. R. Dean with a lot of charmingly leaved flowers unnamed.

PREMIER AURICULA.—The Rev. F. D. Horner's plant of George Lightbody with nine perfect tips.

POLYANTHUSES: SIX GOLD-LEAVED.—1st, Mr. S. Barlow, with Rose of Sharon, a fine flower of England (Mund), Cheshire Favourite (Saunders), Prince Regent (Cox), Sunrise (Barlow), and Exile (Crownshaw), 2d, Mr. W. Bolton with Earl of Lincoln (Hufton), Exile (Crownshaw), George IV. (Buck), Cheshire Favourite (Saunders), and President (Liton); 3d, Mr. James Douglas, with Rev. E. L. Fellows (Crownshaw), Earl (Bullock), Exile (Crownshaw), and George VI. (Buck), Cheshire Favourite (Saunders), and President (Liton).

THREE GOLD-LEAVED.—1st, Mr. S. Barlow, with Cheshire Favourite (Saunders), Firely (Barlow), and Exile (Crownshaw); 2d, Mr. Bolton, with two seedlings and Buck's George IV.; 3d, Mr. R. Dean.

SINGLE SPECIMENS.—1st, J. T. D. Llewellyn, Esq., with Cheshire Hero; 2d, Mr. Brockbank, unnamed; 3d, 4th, and 5th, Mr. Barlow, with Firely, Cheshire Hero, and Exile; and 6th, Mr. R. Dean, with George IV.

Royal Botanic: April 26.—A smaller show than the last, but still of good quality, and favoured with better weather than the visitors to Kensington experienced on previous days, although threatening at times rain with easterly gigue. Roy Cross featured, and included the remarkable group of standards shown at Kensington by Messrs. James Veitch & Sons; a group of nine bushy specimens from Messrs. Paul & Son, Westhart, which took a 1st prize, and consisting of well-bloomed plants of Countess de Sereny, Ed. Maron, Madame Willeroz, Juno, Madame Lacharme, and others; as also from the same firm some grand cut blooms of Maréchal Niel and a collection of robust young plants of various new Roses, including splendid flowers of R. N. G. Baker, Abbot Duport, Madame Welch, Dupuy Jamin, &c. For six new Roses Messrs. Paul & Son also took the 1st prize, the finest being Comtesse Camondo (H.P.), a very dark claret-crimson of great promise, the flowers being full and well built; the others were Madame de Sereny (H.P.), a fine, deep pink shaded rose; Jules Jinger (H.P.), bluish-white; Guillaume Guillemot (H.P.), rose; Madame Angèle Joarquer (Tea); Gloire de Bourg la Reine (H.P.), a dark-centred crimson. Messrs. William Paul & Son, Waltham Cross, W. H. Wood, and others, also had good sized, well grown plants and a splendid assortment of cut blooms, among the former specially good being Countess of Rosebery, J. Hopper, Victor Verdier, La France, Fisher Holmes, Duke of Edinburgh, Madame Fyrot, Crown Prince of Siam, and the new Mrs. Moss Ross, well named Little Gem. Another group of half specimens from Messrs. Lane & Son, Berkhamstead, half a dozen neat plants from Mr. Wiggins, gr. to H. Little, Esq.; and some beautiful cut Teas from Mr. Piper, of Uckfield, also contributed much to the general effect. Stove and greenhouse plants were small, but generally fresh and well flowered, and the leading exhibitors were Messrs. Peed & Son, Norbury Nursery, Lower Norwood; Mr. G. Wheeler, and Mr. H. Eason, gr., North Hill, Hightgate. Azaleas generally were poor, but Mr. G. Wheeler's *Arbutus* (H.P.), a fine dozen, most conspicuous amongst which were Roy Leopold, Duc de Nassau, Ferdinand Kegeljan, and Madame Lemoineir. Of twelve forced Rhododendrons Messrs. Lane & Son were the only exhibitors, showing large and admirably bloomed plants of *Arbutus* (H.P.), *Arbutus* Geert, Guido, Sir R. Feil, Boddartianum, Columbus, Illuminator, and others. Mr. Noble's group of small Clematises was here also much admired, especially the new varieties Darwin, a very beautiful full double flower of a soft shade of lilac, Princess Beatrice, a single very fine and petalled sucer-shaped flower of a clear pale lilac colour; and Daniel Deronda, a very large single flower of a rich purple, with a paler coloured bar, and shaded with reddish-bronze. Show Pelargoniums were admirably exhibited by Mr. Turner and Mr. Wiggins; but Cinerarias were very poorly shown as to quality. Mr. Turner also had some fine perpetual flowering Carnations, and Messrs. Cannell & Sons their group of Primula Siebold.

The same firms also contributed large and attractive collections of stove and alpine Auriculas, which made a nice display. In the competition with twelve show varieties, Mr. Douglas came in 1st with Lord of Lorne (Campbell), Mrs. Moore (Douglas), a new grey-edged, with large tips, remarkable for the breadth of the paste and the depth of the bar; and Jumbo (Douglas), a well leaved green edge, of great promise. Smiling Beauty (Heap), Blackbird (Spalding), Dr. Horner (Reid), C. J. Parry (Turner), Ne Plus Ultra (Smith), Lancashire Hero (Lancashire), John Waterston

(Cunningham), Alex. Meiklejohn (Kay), and Geo. Lightfoot (Headley). 2d, Mr. Turner; 3d, J. T. D. Llewellyn, Esq. Mr. Turner also started several new alpines, from amongst which the following were singled out for distinction:—Gladiator, violet shaded; Mentor, dark purple shaded; Charles Darwin, plum shaded; J. T. D. Llewellyn, violet shaded; and Amazon, heavily shaded red-purple. Groups of new red and rare plants came from Mr. B. S. Williams, and Mr. Bull, and the fine white *Amaryllis Mrs. B. S. Williams* here gained the badge of distinction; while most conspicuous of Mr. Bull's novelties was the beautiful erect flowering *Medimilla amabilis*, first figured and described in our vol. 1, 1874, p. 372, and of which we repeat the figure (fig. 87, p. 561), as, though so fine a plant, it is still little known. *Gymnogramma Lauchiana* grandiceps, a crested form of this well known Gold Fern, shown by Messrs. Dixon & Co., of Hackney; *Adiantum Pacotti*, a very dwarf species, from Mr. Bull; *Pelargonium Fridesmaid*, a bold free decorative variety with the lower petals pure white and the upper ones dark crimson, from Mr. Wiggins; and *Azalea pontica narcissiflora*, a very free blooming plant with clear straw yellow double blossoms, from Messrs. Veitch, were about the pick of the novelties.

The awards made to new plants were:—

Botanical Certificates.

To Mr. B. S. Williams, for *Crimm Makoyanum*.
 To Mr. B. S. Williams, for *Cologny Massaganea*.
 To Mr. W. Bull, for *Odontoglossum Hallii pictum*.
 To Mr. W. Bull, for *Adiantum*.
 To Mr. W. Bull, for *Adiantum Victorice*.
 To Mr. W. Bull, for *Medimilla amabilis*.
 To Mr. W. Bull, for *Davallia filix-plumosa*.
 To Messrs. Dixon & Co., for *Gymnogramma Lauchiana grandiceps*.

Floral Certificates.

To Mr. Turner, for *Alpine Auriculas*, *Gladiator*, *Mentor*, *Charles Darwin*, *J. T. D. Llewellyn*, *Amazon*.
 To Mr. Douglas, for show *Auricula Mrs. Moore*.
 To Mr. Douglas, for show *Auricula Junbo*.
 To Mr. B. S. Williams, for *Amaryllis Mrs. B. S. Williams*.
 To Mr. C. Noble, for *Clematis Daniel Deronda*.
 To Mr. C. Noble, for *Clematis Darwin*.
 To Mr. C. Noble, for *Clematis Princess Beatrice*.
 To Mr. H. Hooper, for bedding *Viola Mrs. Laing*.
 To Mr. H. Hooper, for bedding *Fansy, Mrs. Llewellyn*.
 To Mr. Wiggins, for *Pelargonium* (decorative) *Fridesmaid*.
 To Messrs. Veitch & Sons, for *Azalea pontica narcissiflora*.

British Beekeepers' Association.—The quarterly meeting of the committee and representatives of county affiliated Associations was held in the Board-room of the Royal Society for the Prevention of Cruelty to Animals, 105, Jernyn Street, on Wednesday, the 12th inst. Mr. Thos. W. Cowan in the chair. Further arrangements were made in connection with the exhibitions of bees, hives, honey, &c. to be held at Cardiff in connection with the Bath and West of England Agricultural Society's Show, and at the annual show of the Royal Agricultural Society, to be held at Reading. The Hon. Secretary was requested to communicate with the British Dairy Farmers' Association and to make arrangements for an exhibition of honey, hives, &c., at their annual show, to be held in the Agricultural Hall, Islington, on October 3 and following days. The Hon. Secretary reported the formation of several new county Associations since the meeting of the present year. The progress of these Associations was much retarded owing to the insufficient supply of persons who could act as experts and teach the art of bee-keeping in their respective counties. It was resolved that the Hon. Secretary be requested to communicate with the experts of the central society, and ascertain from them upon what terms they would receive young men, and instruct them sufficiently to enable them to act as experts.

Meteorological: April 19.—The usual monthly meeting of this Society was held at the Institution of Civil Engineers, 25, Great George Street, Mr. J. K. Laughton, F.R.A.S., President, in the chair. The papers read were:—1. "Barometric Gradients, Wind Velocity, and Direction, from the Kew Observatory," by Mr. G. M. Whipple, B.Sc., F.R.A.S., F.M.S., and Mr. J. W. Baker, F.M.S. For the purpose of investigating the subject of the relations of the force and direction of the wind to the distribution of barometric pressure, the authors have distributed Kew observations for the five years 1875-79. The results show that the rate at which the wind blows increases almost directly with the inclination of the gradient in an arithmetical proportion, the mean rate of increase being 1.85 mile per hour for each additional inch of difference in the barometer readings at each end of the slope. The authors find that the angle at which the wind crosses the line of gradient at Kew does not vary with either the steepness of the gradient or the velocity of the wind in any material extent, and also that the angle is found generally to be between 40° and 60°, the average of the whole series of observations giving a deviation of 52°. "On Difference of Temperature with Elevation," by Mr. George Dines, F.M.S. In this paper the author gives a summary of his observations made at Walton-on-Thames during the last six years. Two stations, almost identical in size and construction, were used, one being placed on the ground and the other on the top of the tower of the house; the bulbs of the thermometer in the former being 4 feet, and in the latter 50 feet above the ground. The results show that the average maximum

temperature for every month is always greater, and the average minimum lower, on the ground, than that on the tower.

Obituary.

It is with regret we have to announce the death of Mr. JAMES DALE, so long gardener at Brancepeth Castle. Gardeners, by the very nature and association of their calling, become, like the plants they cultivate, rooted in the soil, and usually cling to the scenes of their cares and labours with an affection that those not so occupied can scarcely understand. None of the many who have had the pleasure of being shown by Mr. Dale over Brancepeth can fail to have noticed and appreciated how strong this laudable feeling was present in him. In 1854 he succeeded his father, who had charge of the garden here so far back as 1796. Mr. Dale was universally respected by all who knew him. He died on April 1, and was interred at Brancepeth church. A notice of this famous old Border castle and its garden will be found in our vol. xiv., n.s., pp. 231, 232.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, APRIL 26, 1882.

April 20.—Showers during the early morning. A fine bright day, sun shining brightly. Fine night.
 21.—A very fine bright day, sun shining brightly. Fine warm, calm night.
 22.—A dull, rainy morning. A fine bright afternoon, sun shining brightly. Fine night.
 23.—Dull, cloudy day; rain in early morning, occasional showers throughout the day. The sky generally clear after 7 P.M.
 24.—A very fine bright day, with frequent showers of rain. Fine clear night.
 25.—A very wet day; steady rain all day.
 26.—A dull morning, fine and brighter after 3 P.M. Fine, overcast night.

LONDON: Atmospheric Pressure.—During the week ending April 22, the reading of the barometer at the level of the sea increased from 29.60 inches at the beginning of the week to 29.50 inches by 9 A.M. on the 16th, decreased to 29.35 inches by 3 P.M. on the 17th, increased to 30.06 inches by midnight on the 18th, decreased to 30.03 inches by 3 P.M. on the 19th, decreased to 30.01 inches by 9 A.M. on the 20th, increased to 30.32 inches by midnight of the same day, and was 29.52 at the end of the week.

The mean reading for the week at the level of the sea was 29.85 inches, being 0.12 inch higher than last week, and 0.09 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 65°, on the 21st. On the 16th the highest temperature was 53°. The mean of the seven high day temperatures was 58°.

The lowest temperature in the shade in the week was 34°, on the 16th; on the 22d the lowest temperature was 49° 5'. The mean of the seven lowest temperatures was 43° 1'.

The greatest range of temperature in one day was 23.5°, on the 21st; the smallest was 10°, on the 22d. The mean of the seven daily ranges was 14.9°. The mean temperatures were, on the 16th, 42° 0'; on the 17th, 48° 4'; on the 18th, 47° 3'; on the 19th, 49° 4'; on the 20th, 53° 0'; on the 21st, 53° 4'; on the 22d, 53°. Of these those of the 17th, 18th, 19th, 20th, 21st, and 22d, were all above their averages by 1° 6', 0° 3', 2° 2', 6° 5', 5° 8', and 5° 2' respec-

tively; and that of the 16th was 3.7 below the average.

The mean temperature of the air for the week was 49° 8', being 2° 0' higher than last week, and 2° 6' above the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo, placed in the full rays of the sun, was 122° 5 on the 21st; the highest on the 19th was 62°. The mean of the seven readings was 97° 9'.

The lowest reading of a minimum thermometer with its bulb placed on grass and fully exposed to the sky, was 30° 4 on the 16th. The mean of the seven readings was 37° 4.

Rain.—Rain fell on three days to the amount of 0.33 inch.

ENGLAND: Temperature.—During the week ending April 22 the highest temperatures were 70° 4, at Cambridge, 66° 6 at Nottingham, and 66° at Sunderland. The highest temperature at Brighton was 59° 8, at Liverpool 60° 4, at Plymouth 61°. The general mean was 63° 5.

The lowest temperatures in the week were 26° 2 at Nottingham, and 28° at Leicester and Hull. The lowest temperature at Liverpool was 41° 5, and at Truro and Plymouth was 41°. The general mean was 32° 6.

The greatest ranges of temperature in the week were 49° 4 at Nottingham, 37° at Hull, and 35° at Leicester. The least ranges were 18° 9 at Liverpool, 20° at Plymouth, and 21° at Truro. The general mean was 30° 9.

The mean of the seven high day temperatures was highest at Cambridge, 62° 1, at Sunderland 59° 5, and at Leicester and Nottingham was 58° 4; and was lowest at Wolverhampton, 53° 8, at Bolton and Bradford 54° 4. The general mean was 57° 1.

The mean of the seven lowest night temperatures was highest at Truro, 46° 4, at Plymouth 45° 5, and at Liverpool 44° 6; and was lowest at Wolverhampton, 39°, at Bolton 39° 6, and at Hull 40°. The general mean was 42° 2.

The mean daily range was greatest at Cambridge, 19° 8, at Nottingham and Sunderland 18° 1; and was least at Truro, 10° 9, at Plymouth 11° 1, and at Liverpool 11° 5. The general mean was 14° 9.

The mean temperature for the week was highest at Cambridge, 50° 7, at Truro 50° 4, and at Blackheath 49° 8; and was lowest at Wolverhampton, 44° 9, at Bolton 45° 5, and at Hull and Bradford 46° 9. The general mean was 48° 2.

Rain.—The largest falls were 1.68 inch at Truro and 1.57 inch at Plymouth. The least falls were 0.12 inch at Leeds and 0.32 inch at Sunderland. The general mean fall was 0.70 inch.

SCOTLAND: Temperature.—During the week ending April 22 the highest temperature was 62°, at Aberdeen and Paisley; at Greenock the highest temperature was 57°. The general mean was 60° 1.

The lowest temperature in the week was 24° 6, at Aberdeen; 26° 4 at Glasgow; the lowest temperature was 38° 2. The general mean was 31° 5.

The mean temperature for the week was highest at Edinburgh, 49° 1; and lowest at Aberdeen, 42° 7. The general mean was 46° 2.

Rain.—The largest fall was 1.76 inch at Greenock; the smallest was 0.51 inch at Leith. The general mean fall was 0.89 inch.

JAMES GLAISHER, F.R.S.

Queries.

He that snitcheth much shall learn much.—Bacon.

PARCHAL RATING.—The occupier of 11 acre of land has been assessed at £6 12s 6d on a rental of £7 15s. As tenant's fixtures, or plant, there are five small greenhouses and other frames, and an additional assessment has been charged on these at the rate of £13. Is he, as a nurseryman growing stock solely for a livelihood, exempt from the extra assessment? M. 7.

Answers to Correspondents.

* Prof. Reichenbach complains of some correspondents sending him specimens without any indication whence they come. Some of the parcels have been detained at the English post-office on account of their large size. The Professor's willingness to oblige is notorious, but his time, patience, and purse should not be needlessly trespassing upon.

ARLITON: A. M. Z. We have never seen one exactly like the flower you send, in which there is a double set of petals, and show imagine it is new. You must send better specimens of the other things before we can undertake to examine them.

AVELE AND HELLERBORN: A. Chapman. We do not think that the Hellebore is at all likely to be injurious to the way you suggest. The roots of the Maple have probably got into some soil not suitable for it.

ARACARIAS: H. T. C. The best way of treating the trees is to give them a top-dressing of good fresh loam—a cartload or two to each tree.

AQUATIC PLANTS: H. S. *Nymphaea alba*, N. odo-

ras, Nuphar luteum, Menyanthes trifoliata, Villarsia nymphoides, Butomus umbellatus, Hydrocharis nymphoides, Acorus Calamus, Hottotia palustris, Rumex Hydrolapathum, Myosotis palustris, Polygonum Persicaria, Sagittaria sagittifolia, Iris Pseudocorus Lythrum, Salicaria, Caltha palustris, Ranunculus Flammula, Aster triflorus, Carex Pseudo-Cyperus, C. pendula, Epilobium hirsutum, Equisetum sylvaticum, Osmunda regalis, Lactea Thelypteris, Typha latifolia, and T. angustifolia. These are all fine plants for your purpose. You may call them weeds, if you like, but they are handsome ones.

CAMELLIA: H. S. We are afraid there is no remedy. You had better destroy the plant at once; or, if you prefer, you might try the experiment of making several incisions lengthwise into the ball, not going deeper than the rind, and then mousing it up. It would be an interesting experiment, but we have not much faith in the result. It is possible it would throw out new roots from the edges of the wounds.

CHEMISTRY: Practical. The Chemistry of the Farm (Bradbury, Agnew, & Co.). Your other question next week.

CINERARIAS, DOUBLE: Waite, Nash & Co. Very good indeed. The lighter coloured sort appears to be identical with, or very closely resembling, a named variety, exhibited a few weeks ago by Mr. Verregens, of Birmingham. We think Mr. Cannell has also one very much like it.

ERRATUM.—At p. 256, col. A, sixty-sixth line, for "plentiful," read "portable."

GLOXINIAS: A. W. The deformity is extremely curious, but not uncommon. In the more perfect examples a hose-in-hose corolla is formed, with the singular circumstance that the intensity of colour is outside. Much has been written as to the mostrosity in question, references to which we can furnish if you desire it.

INSECTS: F. D. B. Your Mangel Wurzel roots were partially rotten, and in some portions of the diseased parts we found a number of the Centipede, Julus pulchellus, in different stages of growth. We do not think they are bred within the Peas, and have there diseased portions without any insects in them. The roots seemed to have been injured in digging up. I. O. W.—G. P. The Peas sent are badly infested with the common Pea weevil (Bruchus pisi), the larvae of which were bred within the Peas, and have there assumed the pupa and perfect state. Submitting the Peas to the heat of an oven would kill the insects, but care must be taken not to overheat the seed Peas. I. O. W.

MANURES TO GARDEN CROPS: F. W. S. We do not know of any such book.

NAMES OF PLANTS: H. M. H. Both forms of Scilla nutans, var. Belgica.—Morbifantia. Your plant is an Ichneumon, the Linnaean abreviaturum of Swartz.—Angrecom. Either Dendrobium Dayanum, or a poor form of D. macrophyllum.—Thos. Denny. There is a white variety of Gentiana acialis which is constant. The other plant is Forsytia viridissima.—Sage. Adiantum concinnum, strongly grown.—H. Worcester. Senecio macrogllossus. Figured in Gardeners' Chronicle of June 12, 1875.—Pat. 1, A. Liehen (next week); 2, Pulmonaria officinalis.—B. Ashton. The Bark Cherry (Fronus Padus).

NOTICE TO QUIT: Constant Reader. If a yearly tenant, and you have no agreement to the contrary, you are only legally entitled to six months' notice to quit, such notice to expire on the same quarter-day as that on which you took possession. The landlord is not compelled by law to take any permanent market garden crops at a valuation. You should not so have covered the ground except under a proper lease.

POTATO EXPERIMENTS: Practical. Apply to the Secretary of the Cork Agricultural Society.

VINES: R. P. Hopkins. The leaves have been scalded by the sun acting upon them while moist. Give air earlier in the day, and you will avoid such mischief in the future. Liquid manure, however strong, would not have the same effect.

Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editor.

CATALOGUES RECEIVED.

DIED, on the 20th inst., at her residence, Arnside, Muswell Hill, aged eighty-eight, HARRIET McMULLEN, relict of W. G. McMullen, of the late firm of Hurst & McMullen, 6, Leadenhall Street, E.C.

Markets.

COVENT GARDEN, April 26.

Business somewhat improving, our market being more readily cleared at previous prices. Large arrivals of Asparagus from the Continent. James Webber, Wholesale Apple Market.

Table with 2 columns: Fruit and Average Wholesale Prices. Items include Apples, Figs, Gooseberry, Grapes, Kent Cobs, Lemons, Pine-apples, Strawberries.

Table with 2 columns: Vegetables—Average Retail Prices. Items include Artichokes, Asparagus, Beans, Beet, Carrots, Cauliflowers, Celery, Cucumbers, Kidney Beans, Lettuce, Onions, Peas, Potatoes, Spinach, Tomatoes.

Table with 2 columns: Cut Flowers—Average Wholesale Prices. Items include Abutilon, Amaryllis, Arum Lilies, Azalea, Begonia, Bouvardia, Carnations, Cineraria, Cyclamen, Daisies, Gardenias, Heliotropes, Impatiens, Lilies, Lilium, Magnolia, Marigolds, Mimulus, Narcissus, Petunias, Pinks, Ranunculus, Roses, Tulips, Violets, Wallflowers.

Table with 2 columns: Plants in Pots—Average Wholesale Prices. Items include Aralia Sieboldii, Arborvitae, Begonia, Brunia, Cyclamen, Cyperus, Dieffenbachia, Dracaena terminalis, Ficus, Geranium, Hebe, Hesperis, Impatiens, Myrica, Nerve, Pelargonium, Spiraea, Wilmoriana.

SEEDS.

LONDON: April 26.—A quietness now begins to settle down upon the seed trade, which is a pretty fair sign that we are very near the end of the sowing demand for this season. Red Clover continues to meet a fair sale at slightly easier prices, the offerings being now almost exclusively confined to Canadian and a few parcels of inferior English seed. White Clover and Alsike are without change in value, and meet a steady sale, but Trefoil and Lucerne lower prices have to be accepted to effect sales. Italian Ryegrass: there is a brisk demand for this article, and full prices are readily obtained, the meagreness of stocks leaving holders for the moment masters of the situation. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

COALS.

The following are the prices current at market during the week:—East Wylam, 15s.; Ravensworth West Hartley, 14s. 3d.; Walls End—Haswell, 15s. 6d.; Hetton, 15s. 3d.; Hetton Lyons, 14s.; Hawthorns, 14s. 3d.; Lambton, 15s.; West, 14s.; South Hetton, 15s. 6d.; Tunstall, 14s.; Tees, 15s. 6d.

POTATOS.

The Borough and Spitalfields Markets reports state that supplies have been quite adequate to demand, which is attended chiefly to test quality. Quotations.—Scotch Champions, 50s. to 60s.; ditto Regents, 70s. to 80s.; ditto Magnum Bonums, 85s. to 90s.; Victorias, 110s.; Lincoln Champions, 60s. to 70s.; York ditto, 60s. to 70s.; ditto Victorias, 110s. to 120s.; flukes, 120s. per ton. German Reds, 35s. to 50s. per bag.—The exports into London last week were as follows:—1850 bags from Hamburg, 137 cases Malta, and 20 bags from Rotterdam.

THE LIVERPOOL HORTICULTURAL COMPANY

(JOHN COWAN) Limited, The Vineyard, Garston, near Liverpool

The Company having recently made large and successful importations of Orchids from India, beg to offer Twelve DENDROBIUMS, in pots and baskets, just starting into growth, including package, for 42s., as follows:—Dallohusianum, Parishii, heterocarpum, Falconeri, Wardianum, Chrysanthum, formosum, Devonianum, thysiflorum, Primitivum, calcolum, crassinode.

The Company offer the following specialities:—

TEA ROSES—Twelve finest varieties, package included, for 12s., 18s., or 24s.

PELARGONIUMS—Twelve finest varieties coming into flower, package included, for 12s., 18s., or 24s.

FLOWERING PLANTS—Twelve finest varieties, for GREENHOUSE Decoration, for 12s., 18s., or 24s., package included.

The Company have a fine general stock of STOVE, GREENHOUSE, and ORNAMENTAL FOLIAGE PLANTS.

The Company beg to announce that their young VINES, from eyes this season, are now in fine condition for planting Vineries, and also that they have still on hand a few good Canes of most varieties suitable for fruiting in pots and planting Vineries.

The Company beg to call special attention to

Thomson's Vine and Plant Manure,

which is manufactured by them, and is the Manure used for producing the splendid Grapes grown at Clovenfords. Though this Manure has only been offered to the public during the past four months, the Company are already receiving the strongest testimonials in its favour from those who have used it, and its grand effects are at once apparent to all who see the Vines and Plants in the Vineyard and Nurseries here.

HORTICULTURAL BUILDINGS of all kinds erected and heated in the best manner and at moderate cost.

HILL and SMITH'S BLACK VARNISH
for Preserving Ironwork, Wood, or Stone.
(Registered Trade Mark)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the inventors, and its genuine good quality, notwithstanding a host of unprincipled imitations, is fully proved by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, in the Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have received.

Sold in Casks of 20 or 30 gallons each, at 1s. 6d. per gallon at the Manufactory, or 1s. 2d. per gallon carriage paid to any Station in the Kingdom.

UNQUALIFIED TESTIMONIAL.
"Proceedings of the Times, 25th July 1874."—I have this day forwarded from Chipping to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierrefield Park, Chesham. — I am, sirs, yours respectfully, Wm. Cox."

CAUTION.—Hill & Smith would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade mark as above, without which none is genuine.

Large Illustrated Catalogue of Ferrets, Hurdles, Field and Entrance Gates, &c., sent free on application to—**HILL AND SMITH, Dinsley Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 129, Buchanan Street, Glasgow.**

IMPORTANT NOTICE.—Advertisers are cautioned against having Letters addressed to INITIALS, or to FICTITIOUS NAMES, at Post-offices, as Letters so addressed are not forwarded, but are sent at once to the Returned Letter Office.

PARTNERSHIP.—Advertiser, with Glass and Ground, seeks WORKING PARTNER, to Grow for Market, all small seasons. Near Manchester. Lease. Also a GARDENER WANTED, used to above work.—C. F. C., *Gardener's Chronicle* Office, W.C.

WANTED, a HEAD WORKING GARDENER, who thoroughly understands the Cultivation of Plants and Fruit under Glass, and whose Wife is a good Laundress. Family small.—A. D., 22, Whitehall Place, W.

WANTED, a practical GARDENER—must be thoroughly understood in Vine and Peach-tree, Currant Strawberries, Melons, &c. Wages 2s a week.—Apply with testimonials, to E. H. FORWOOD, Manor House, Chesham.

WANTED, as GARDENER, a steady, active experienced single man, used to Horticulture, Kitchen, and Flowers. He will be required to make himself generally useful. Wages 24s per week and board.—Mr. SHEPHERD, The Lodge, Aberdeen Park, Highbury, N.

WANTED, a married man, without family, as SECOND GARDENER (to live in a Lodge); E. J. Kennal Manor, Chislehurst, Kent.

WANTED, a married man, as UNDER GARDENER who understands Growing Straw and Greenhouse Plants. Wages 20s per week, with large Vegetables, and milk.—W. BRUNSDELL, Ashlays, Great Berkhamstead, Herts.

Propagator and Grower of Market Plants.

WANTED, an active energetic MAN, well qualified to Produce and Grow in large quantities, and sell first-class style, Hard and Soft-wooded Flowering Plants. A thoroughly capable man would find this a desirable situation in every way. It is essential that applicants be able to refer to well-known Market Growers, with whom they have gained their experience.—L. K., Hurst & Son, 175, Oldbush, E.C.

WANTED, a good PROPAGATOR—one who thoroughly understands the Cultivation of Roses, Rhododendrons, Camellias, Conifers, &c.—Apply by letter, stating full particulars, qualifications, wages required, &c., to W.M. KNUHT, Floral Nurseries, Hulsim, Saxony.

WANTED, an active industrious man as PROPAGATOR and GROWER of Soft-wooded Plants for Market—one who has Ground for Covent Garden preferred. Must be a thorough practical man. Wages, 60s, good cottage, and overtime.—SHAWS, Nurseries, Kenilworth, Leics, Yorkshire.

WANTED, as ROSE GROWER, a thoroughly efficient man. Must have had great experience, so as to take care of roses as they are grown well and extensively.—Apply, stating age, references, and terms, to JAMES DICKSON AND SONS, "Newton" Nurseries, Chester.

WANTED, a MAN, aged 35. Wages 24s. per week. Must have been in Market Nurseries, and be quick at Pottling, Watering, &c.—Apply by letter, with reference, to H. E., Chiswick Nursery, Turnham Green.

WANTED, TWO young MEN, used to Pottling, Watering, &c., for Market Nursery. Wages 18s per week.—J. COLE BROS., Goose Green, East Dulwich, S.E.

WANTED, an active young MAN, with good character and thorough knowledge of Forcing Fruit, &c.—Mr. LORMICK, The Nurseries, Ashford, Staines, Middlesex.

WANTED, a MAN, to assist in the Greenhouse, and make up off-sets.—Apply, personally, to R. CHILDS, Bloeham Nurseries, 67, Rye Lane, Peckham, S.E.

WANTED, a thoroughly efficient and energetic MAN, for the Forestry Department of a large Nursery—Apply, stating age, qualifications, references, and salary expected, to NURSERIES, Messrs. Nutting & Sons, 60, Islington, London, E.C.

WANTED, AT ONCE, an experienced BOOK-KEEPER and CASHIER. Must be thoroughly trustworthy and quick at the account. None but the best characters will bear the strictest investigation as to sobriety and trustworthiness need apply. Guarantee required.—Apply, stating experience, salary, and references, to S. WILLIAMS, Victoria and Paradise Nurseries, Upper Holloway, N.

TRAVELLER WANTED.—THE ADVERTISER wishes to meet with One or Two energetic Men, having a connection amongst Seedsmen, Florists, and Gardeners, or still in connection with the Horticultural world, who can command a large Sale. Manchester and neighbourhood would require special attention. Only those who can give exceptional references need apply. Address only, A. B., 3, Tyndale Place, Upper Street, Islington, London, N.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING and COLLECTING MACHINES for 1882.

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her Most Gracious Majesty the Queen on many occasions, His Royal Highness the Prince of Wales, the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "Journal of Horticulture" of June 9, 1881.—"MOWING MACHINES.—After a critical examination the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. Green & Son, of Leeds and London. As the machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 105,000 of these Machines have been Sold since they were first introduced in the year 1856,

And Thousands of unsolicited Testimonials have been received testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

The following are their advantages over all others:—

- 1st. Simplicity of Construction—every part being easily accessible. 2d. They are worked with much greater ease than any other. 3d. They are the least liable to get out of order.
- 4th. They make little or no noise in working. 5th. They will cut either short or long Grass, wet or dry.

Single-handed Lawn Mower.

To cut 6 inches	Price £1 15 0
Can be worked by a Lady.	
To cut 8 inches	2 10 0
Can be worked by a Lady.	
To cut 10 inches	3 10 0
Can be worked by a strong Youth.	
To cut 12 inches	4 10 0
Can be worked by a Man.	
To cut 14 inches	5 10 0
Can be worked by a Man.	

Double-handed Lawn Mower.

To cut 16 inches	Price £6 10 0
This can be worked by One Man on an even lawn.	
To cut 18 inches	7 10 0
By a Man and Boy.	
To cut 20 inches	8 0 0
By a Man and Boy.	
* To cut 22 inches. By Two Men ...	8 10 0
* To cut 24 inches. By Two Men ...	9 0 0
* If made stronger, suitable for Donkey, 30s. extra.	

Prices of Donkey, Pony, and Horse Machines, including Patent Self or Side Delivery Box, with Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness:—

DONKEY and PONY MACHINES.

To cut 26 inches	£14 0 0
To cut 28 inches	16 0 0
To cut 30 inches	18 0 0
Leather Boots for Donkey	1 0 0
Leather Boots for Pony	1 4 0

HORSE MACHINES.

To cut 30 inches	£22 0 0
To cut 36 inches	26 0 0
To cut 42 inches	30 0 0
To cut 48 inches	34 0 0
Leather Boots for Horse	1 9 0

The 26 and 28 inches can easily be worked by a Donkey, the 28 inches by a Pony, and the larger sizes by a Horse; and as the Machines make little noise in working, the most spirited animal can be employed without fear of it running away, or in any way damaging the Machine.

GREEN'S PATENT "MULTUM IN PARVO" LAWN MOWER.

PRICES.

Without Grassbox.

To cut 6 in. £1 1 0
To cut 7 in. 1 8 0
To cut 8 in. 1 15 0

PRICES.

With Grassbox.

To cut 6 in. £1 5 0
To cut 7 in. 1 13 0
To cut 8 in. 2 0 0

This Mower is specially designed to meet an almost universal want experienced by those who have small lawns or grass plots, to have a good and useful machine at a low price. The inventor having seen this want continually increasing, year by year, has brought out the Mower to meet the requirements of the public by supplying a good and useful machine at a cheap rate.

It is simple in construction, easily adjusted, is well adapted for mowing small plots, cutting borders, verges, round flower beds, the edges of walks, &c.; it is a most handy, servicable machine, and very easy to work.

GREEN'S PATENT GRASS EDGE CLIPPER. GREEN'S PATENT LAWN TENNIS COURT MARKER.

Specially designed to cut the overhanging grass on the edges of walks, borders, flower beds, &c., and to do away with the tedious operation of cutting with shears.

SIZE and PRICE.

Wide. 8 inch ..	Diam. 7 inch ..	£1 10
Packing Case, 2s.		

This Machine is of novel design and construction, and the simplest and most effective in its operations.

In the trough containing the liquid there is a loose drum which revolves when the machine is in motion, and conveys the marking material to the intermediate pulley, which in its turn transmits it to the front one, so that the ground is marked effectively as the machine is pushed along.

Price, 21s.

Small Bag of Patent Marking Composition, Mat, and Packing, 1s. 6d.

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland.

No Lawn Mower Manufacturer keeps so large a stock of Mowers as is to be found at our London Establishment, 54 and 55, Blackfriars Road, where purchasers can select out of several hundred Machines, of Hand, Pony, and Horse Power, and have their Orders executed the same day they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, free of cost to the Purchaser.

N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London Establishment, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

Garden Seats and Chairs, and Horticultural Implements of every description, Wire Netting, &c., &c.

Descriptive Illustrated Price Lists free on application to

THOMAS GREEN & SON (Limited), Smithfield Ironworks, Leeds; and 54 and 55, Blackfriars Road, London.

TWO SPECIALITIES WORTHY OF EXTRA NOTICE.

The best Zonal Pelargonium in Cultivation for Summer Bedding is undoubtedly

MILES' WEST BRIGHTON GEM.
After five years' trial it still holds the first position as the most floriferous, compact, and effective variety yet introduced.

Awarded Three First-class Certificates.
Price, in 60-seed pots 4s. 1s. 6d. per dozen.
" " " 1s. 12. to 1s. 6d. each.
Special quotations for large quantities.

MIGNONETTE.

No variety ever introduced has been found to equal

MILES' NEW HYBRID SPIRAL.
Its beautiful, robust, compact and vigorous habit is the admiration of all who see it.
It is far more fragrant than any other variety.
Price of seed (in sealed packets only), 1s. per packet.
Established plants, in single pot 5s. to 12s. per dozen; or 1s. 6d. each.
Liberal Discount to the Trade.

GRASS SEEDS

FOR LAWNS,

Of the finest close-growing Evergreen kinds, 1s. per lb. Special preparations for all purposes, soils, and situations. Advice gratis.

Unsolicited Testimonials:-

" Knowing how difficult it is to obtain pure stocks of grass seeds, even when price is a secondary consideration, I write to say the supply I obtained from you for our new terrace lawns has given the greatest satisfaction."
" Please send me three bushels of the very best Lawn Grass Seeds, suitable for an exceedingly hot upland soil. The seed I have had of you has been the only kind which has been able to resist the influence of the sun and drought upon my thin, gravelly soil."

FARM SEEDS

Of all kinds, which have given unequalled satisfaction. See Illustrated and Descriptive LIST, free on application.

ORCHIDS.

The Largest and Best Stock in Europe of good Established Plants.
Tens of Thousands of Plants to select from.

MR. WILLIAM BULL

Begs to intimate that his Orchid-houses are always quite a sight, from the large number of plants in flower, and will be pleased to show them to any one interested in this beautiful class.

MR. WILLIAM BULL

Recommends those desirous of having their Houses gay with Orchid flowers, to purchase good established well-cultivated plants, which bloom well, are far more satisfactory, and comparatively cheaper than newly imported or semi-established plants.

COLLECTIONS of the most useful **VEGETABLE SEEDS** made up liberally, carriage paid, for 10s. 6d., 21s., 42s., and 63s. See Catalogue.

WM. GLIBRAN & SON,
 OLDFIELD NURSERY, ALTRINCHAM.
DAHLIAS, SINGLE AND DOUBLE.
H. CANNELL AND SONS beg to invite all lovers of the above to see their splendid stock consisting of not less than 12,000 plants of all the best varieties in cultivation, the single varieties, &c., including their Glaze of the Garden, New White Avalanche, New Paragon, Cambridge Yellow, and the new set of splendid kinds raised by T. Hove, Esq., and many others whose beauty and splendour are almost beyond description; for full particulars of which see the best, most correct, descriptive and Illustrated Catalogue ever published, sent post-free.

Dahlia Jaegerzi.
 The secret of having this magnificent variety (King of the Autumn) in its full splendour is to plant last year's bulbs (not spring-struck plants) and consequent on our having introduced it we hold 500 fine pot roots—and now offer them at 2s. each, 20s. per dozen. These will flower nearly equal to the ordinary kinds, and give that satisfaction and unusual beauty which no other plant in open garden has afforded for many years.

DOUBLE PYRETHRUMS.
H. CANNELL AND SONS beg to announce that they have the best and most effective colour—
 Condition for immediate planting and flowering all the season, in 100 best varieties in cultivation. H. C. & S. selection, 5s. per dozen; 35s. per 100, mostly showing flower.

VIOLAS (Half an Acre).
 THE above are now a grand sight, and will continue so all the season. The most effective colours—Blue, White, and Yellow. Splendid plants, ready for planting, full of flower-buds, 2s. per dozen, 9s. per 100.

ALEXANDER PEACH.

Pyramid and dwarf-trained Trees, in pots, of this very early and valuable forcing Peach can be supplied at 10s. 6d. each.

THOMAS RIVERS & SON,
SAWBRIDGEWORTH, HERTS.

“THE COVENTRY.”
 (REGISTERED).

NETTLEFOLD & SONS desire to call especial attention to their “COVENTRY” LAWN MOWER, which they can confidently recommend as the best and cheapest in the Market. It has all the improvements which have of late been introduced into this class of Machine, either in England or America; and for the manner in which it does its work, its lightness, and the ease with which it can be used, cannot be surpassed. Its cheapness brings it within the reach of every one, and in this respect it defies competition with any American machine before the public. It is made, as it name implies, at Coventry, by skilled English workmen, and of best English Steel and Iron. These Machines can also be supplied with ROLLERS AT SAME PRICE, and GRASS BOXES at a small extra cost.

MANUFACTURED BY

NETTLEFOLD & SONS,
 54, HIGH HOLBORN, LONDON, W.C.

BOULTON & PAUL, Horticultural Engineers, NORWICH.

CONSERVATORIES, ORCHARD-HOUSES, PEACH-HOUSES, GREENHOUSES, &c. Illustrated Catalogue, Twelve Stamps; Illustrated Lists, Post-free.

Independent Slow Combustion Boiler for Small Greenhouses.

TO HEAT BY HOT WATER; REQUIRING NO BRICKWORK.

Specially adapted for small Greenhouses; for quick heating or slow combustion. Quite portable, and will heat properly for twelve hours. Made with strong wrought-iron cylinder set in a cast-iron base, with fire-bars and sliding door. Only one-tenth the cost of heating by gas, and much more effective. Fitted with two 2-in. cast sockets, door for feeding, and socket for smoke-flue.

Cash Prices—Carriage paid.

of Boiler complete, as shown in illustration, but exclusive of piping:—

Size.	Total Height.	Diameter.	To heat 4 in. Piping.	Price.
1	27 in.	16 in.	40 ft.	£3 10 0
2	30 in.	16 in.	60 ft.	4 0 0
3	33 in.	16 in.	80 ft.	4 10 0
4	36 in.	16 in.	100 ft.	5 0 0

Plain Saddle Boiler.

Plain Saddle Boilers are generally used for heating from 100 feet to 300 feet of 4-in. piping; above that quantity it is more economical to use our Check-end Boiler, as one of these, 3 feet long, will heat double the quantity of piping a 3-foot Plain Saddle will.

Size of Sockets.	Size of Boiler inside arch.			Heating Power for 4-in. Piping.	Prices on application.
	Length.	Width.	Height.		
Fitted with 2 Sockets.	18 in.	22 in.	10 in.	120 ft.	Prices on application.
	21 in.	22 in.	10 in.	125 ft.

8	60 in.	33 in.	24 in.	6	2000 ft.	30 0 0

The Phoenix Slow Combustion Boiler.

We claim for our Phoenix Upright Boiler the following good qualities, viz.—It is made of the best materials; has no parts that are liable to failure; is provided with a flue that cannot be choked with fuel; will heat effectually the quantity of pipes stated with the smallest amount of fuel; can be easily regulated; and will hold fuel sufficient for keeping up the proper heat twelve hours; requires no brickwork, and takes up the smallest space of any boiler of its power.

Sockets can be placed in any position.

Cash Prices—Carriage paid.

Size.	Total Height without Feed Hole.	Diameter of Boiler.	Heating Power for 4-in. Piping.	Price.
1	25 in.	16 in.	150 ft.	£6 0 0

Boilers made to suit any position for Baths, Harness Rooms, Lavatories, &c., &c. All sizes of Boilers given in this Advertisement are kept in stock, and are rated to effectually heat the quantity of Piping named with a minimum amount of fuel. All Orders amounting to 40s. Carriage Paid to any Railway Station in England and Wales; also to Edinburgh, Glasgow, Dublin, and Belfast.

DENDROBIUM FORMOSUM GIGANTEUM.

HEATH AND SON

Beg to announce the arrival of an immense importation of the above, from the same locality in Upper Burma as those last year, which gave such enormous flowers, many measuring 6 inches in diameter.

The “GARDENERS’ CHRONICLE” of October 1, 1881, says:—“From Heath & Son of the College Road Nurseries, Cheltenham, we have been favoured with a bloom of this noble Orchid, measuring 5½ inches across, from a new district in Northern Burma. The lip is 2 inches broad and the yellow blotch very bright.”

The plants from this locality flower twice a year—in the autumn from the new growths, and in the spring from the old, with two to four spikes and from two to five flowers on a spike. The bulbs are very large and many measure 3 feet long.

Small plants, one and two breaks .. 60s. per dozen.
 Small plants, three and four breaks.. 84s. „

Larger plants, six to eight breaks.. 100s. per dozen.
 Few specimens and large masses .. 21s. to 63s. each.

HEATH & SON, EXOTIC NURSERIES, CHELTENHAM.

GREEN'S PATENT

"Silens Messor" and "Multum in Parvo" LAWN MOWERS.

They have proved to be the best, and have carried off Every Prize in all cases of competition. Every Lawn Mower is guaranteed to give entire satisfaction, otherwise they may be returned AT ONCE, free of cost to the purchaser.

HAND MACHINES,

It is simple in construction, easily adjusted, is well adapted for Mowing Small Plots, Cutting Borders, Verges, round Flower Beds, the Edges of Walks, &c. It is a most handy, serviceable Machine, and very easy to work.

GREEN'S PATENT GRASS EDGE CLIPPER.

A MOST USEFUL MACHINE.

Price, £1 10s.

Packing Case, 2s.

Size:

8 inches wide by 7 inches diameter.

GREEN'S PATENT LAWN TENNIS COURT MARKER.

Price, 21s.

Small Bag of Patent Marking Composition, Mat, and Packing, 1s. 6d.

They can be had of all respectable Ironmongers and Seedsmen in the United Kingdom, or direct from the Manufacturers,
THOMAS GREEN & SON (LIMITED).

SMITHFIELD IRONWORKS, LEEDS;
And 54 and 56, BLACKFRIARS ROAD, LONDON, S.E.
Carriage paid to all the Principal Railway Stations in the United Kingdom.

FOR ROSES.

The attention of Rose Growers is respectfully called to the following Editorial Notices:—

See GARDENERS' CHRONICLE, April 29, 1882.

"A group of standard Roses in pots, staged by Messrs. Veitch & Sons, were a special and marked feature in the Conservatory at Kensington on Tuesday last. . . . What massive heads they had — what healthy and fine-coloured foliage—and what splendid flowers they bore. These were characteristics noted by all. When it is stated that they were in comparatively small pots, and had not been repotted for four years, the fact that *Clay's Fertiliser* was exclusively used as a manual agent is of the greatest importance. It appears that in the autumn some 3 or 4 inches of the soil was removed and a dressing of the Fertiliser applied, which was covered with a layer of suitable compost, and in the spring a top-dressing of the Fertiliser was given once or twice."

See the GARDEN, April 29, 1882.

"Probably there never has been such a marvellous exhibition of standard Roses in pots as those staged by Messrs. Veitch, at Kensington, on Tuesday last. Every plant in the collection was a marvel of cultured skill, so different from the usual stamp of standard Roses, for each carried a huge and spreading head of vigorous foliage and numerous flowers of really high quality as regards size, form, and colour. The most remarkable point about the collection is the extremely small size of the pots, and the fact that they had not been repotted for four years; but the plants, in order to develop so finely, have been sustained by judicious applications of *Clay's Fertiliser*, a fact which speaks well for that manure."

See GARDENERS' MAGAZINE, April 29, 1882.

"A silver medal was awarded to Messrs. Veitch & Sons for a magnificent collection of standard Roses in pots, in the culture of which the *only manual matter employed* was *Clay's Fertiliser*, which has proved to be of especial value for Roses."

THE

Gardeners' Chronicle.

SATURDAY, MAY 6, 1882.

THE DEEPEENE,

THE best known and most delightful of all the "stately homes" in Surrey, occupies, with its shrubberies and gardens, a site formed by the frolicsome fairies immediately above their favourite town of Dorking. The graceful spire of St. Martin's Church, though springing from a lower level, might seem to rival the Cedars on the lawn but for the excluding foliage, which secures the privacy that home life requires.

Having long been familiar with the Italian balustrades of Deepdene, seen amid the foliage from without, I felt unbounded pleasure at hearing my first nightingale of this year singing among its groves, hid from the sun of one of the finest days of the present spring.

Owing to the warmth of the soil and the shelter of the hills the tender Conifers at Deepdene are rarely cut or browned by winter and rough weather, and this spring the *Cryptomeria japonica* is exquisite in grace and health. The geology is favourable for Conifers and many other ornamental trees. Greensand, whose colour in this district is usually yellow, will produce at the worst Scotch Fir, an exceedingly ornamental Conifer, and Gorse, a shrub which needs no praise. Elsewhere, and almost always in the hollows, the Greensand is sometimes a hazel loam, sometimes a sandstone rubble much approved by that pretty little native shrub, the Whortleberry, and by *Rhododendrons* and American plants. These are the materials, common to rich and poor, as all outdoor vegetation must needs be, which decorate the grounds at Deepdene and which surpass in beauty the costly art treasures of its galleries. They are well arranged, undoubtedly, and the charm and novelty of great variety have been secured, but the great mass of the shrubs in the groves and thickets about the house consist of *Rhododendrons* and *Azaleas*; and the lively though lowly Whortleberry, with the *Hypericum*, carpet the ground and form an edging for the carriage drives.

It is unfair, perhaps, to compare such tinsel as a painter puts on canvas with the colours spread by Nature's abler hand, but for the sake of naming a purple blossom richer even than the flower of the Gentian, I may say that not even *Raffaello's* and *Coreggio's* painting seemed to me so beautiful as the *Lithospermum prostratum* in the shrubberies. It is an exquisite and hardy plant lying in masses on the ground, and possessing many merits besides its beauty. It has been in full blossom two months, and is still gorgeous. Rabbits do not eat it, and it continues spreading for years, painting the whole surface with purple during March, April, and May. It grows at Deepdene on the right-hand side of the drive, entering the grounds from Chart Lane, and among its companion shrubs are the Heather of the district, cream-blossomed Broom, double Furze, and *Rhododendrons*. This is, perhaps, the prettiest entrance—if pretty is a proper word. The road skirts a richly shrubbed and planted hill, which rises high on the right, the left being open to the vale

of Dorking and the heights of Denbies and Ramore beyond. Two or three beds of variegated Maple and purple Filbert in the margin are noticeable here, and presently the road enters a narrow strait of evergreens, and then, turning suddenly to the right, it winds round a recess, or dell, in the hill, open on the west side, and otherwise absolutely sheltered. Nothing can be more beautiful than the mass of Rhododendrons and specimen trees which fill this recess, including two Conifers of special size and beauty—a *Cryptomeria japonica* and a *Taxodium sempervirens*. A little further and the house is immediately before you, with its pleasant lawn studded with Cedars of Lebanon, evergreen Oaks, a Tulip tree, and many exotic Conifers, *Pinus insignis*, *P. Cembra*, *P. Lobbi*, *Abies Pinosapo*, and others. The plants covering part of the south wall of the house are Magnolias, the Wistaria, Clematis, and Ivy. Orange trees for the lawn are managed here with great success on the French plan, wintered in caves from November 1 to April 1, with very little light, then placed under a verandah and gradually accustomed to the light, and afterwards removed to their permanent positions, where they blossom three times during the summer, the bloom being encouraged by the removal of the fruit.

The germ of Deepdene existed 200 years ago when the Norfolk family owned the property. Evelyn, who himself lived hard by at Wotton, 2 miles off on the Guildford road, spoke of "the extraordinary garden" here, and wrote in his *Diary* in 1655, "I went to Dorking to see Mr. Cha. Howard's amphitheatre garden, a solitary recess, being 15 acres environed by a hill." Old Aubrey described the place in quaint and simple English as "the most pleasant and delightful solitude for house, gardens, orchards, boscaiges, &c., that I have ever seen in England. It is an epitome of Paradise, and the Garden of Eden seems well imitated here." At the beginning of the present century Deepdene was purchased by Mr. Thomas Hope, the author of *Anastattus*, who bequeathed to his son, the late Mr. Henry Thomas Hope, a love for the fine arts, "an epitome of Paradise," and large resources. The old house was replaced forty years ago, and the grounds and estate have been much enlarged. Three sites of former mansions are now included in the park and ornamental part of the domain. The house in Chart Park has vanished, but some fine Cedars of Lebanon, measuring 17 and 20 feet round the trunk, several feet from the ground, and having in one case an immense head of a dozen big limbs, with other trees of ornament, mark the site of the pleasure grounds.

A "temple" dedicated "to the best of brothers," marks the highest ground in the domain, midway between Chart Park and Deepdene, and from this spot the two entirely different landscapes are presented, north and south, one including the ornate house and grounds below, Dorking, Box Hill, and other points of the North Downs, with the gorge in the hill opened by the river Mole. The Holmwood and the Wealds of Surrey and Sussex as far as the tower of East Grinstead Church, lie on the south side of the ridge, together with that other conspicuous tower on Leith Hill, which is shut out from here, however, by intervening woods.

Beech trees surround the Temple and an avenue runs along the ridge. A Larch of weeping habit near this spot claims notice, as well as many specimen trees elsewhere, such as Araucarias, *Abies Douglasii*, *A. lasiocarpa*, a Larch exceeding 100 feet, and a tall Spruce. There is only one *Wellingtonia gigantea* in these grounds, where the much more graceful *Cryptomeria japonica* supplants it. One of the pleasantest views within the boundaries of the domain is down, or up the den, or dell, called by Aubrey "a long hope, i.e., according to Virgil, *Deductus Vallis*,"

reaching from the Temple to the lower ground, where a superb tree, of light green foliage and magnificent blossoms in May, yelet a Horse Chestnut, terminates the long vista.

It is impossible to imagine a more congenial scene than Deepdene for the meditations of a Disraeli, and the conception of *Coningsby*, which was written here. Owing to the art of their formation and the unlevel surface, the pleasure grounds appear twice as great as their actual area of 65 acres. The park, however, is extensive, including that which was formerly attached to Betchworth Castle, a structure now dismantled and formally ruined by the builder's hand and a dense growth of Ivy. For the sake of appearance this house of the last generation would be better restored and occupied, since it has its own park, with two noble avenues of Limes and of Sweet Chestnuts, the largest in Surrey, 25 feet girth. Two domains so different in style and ornament do not blend well, and it may be hoped that this sole blot in a scene so fair may be, at some future time, removed.

The grounds and gardens of Deepdene are under the able management of Mr. Burnett, who also has charge of the kitchen gardens, and the various houses for fruit or flowers. *H. E.*

New Garden Plants.

VANDA SANDERIANA, n. sp.*

The grandest novelty introduced for years! A golden letter day. How I regret not to be able to assist at the *bal parsé* at Mr. Stevens' Rooms!

The sepals are almost circular, the petals small, cuneate oblong, blunt. The lip has a blunt triangular blade and the hypochil appears to have been gibbous with upright square borders. To increase my happiness [disjunct rather], the whole flowers have been neatly pressed with hot irons and the column, anther, pollinarium, and hypochil are broken to pieces as on a field of battle. Its most surprising feature is its dimensions; the circumference is of 0.366 m.—say 15 inches. From the top of the odd sepal to the top of the lateral ones, the flower measures 5 inches! It has flowers which belong to the grandest of the family—after the *Cattleya labiata* group, *Angraecum sesquipedale*, and some giant forms of *Lycaste Skinneri*. The two latter, however, have neither rounded nor flat flowers, while *Vanda Sanderiana* is said to have flowers as flat as those of *Odontoglossum vexillarium*. The plant has broader leaves than those of *Saccolabium violaceum*. Long peduncles bear numerous flowers and buds. The odd sepals and petals are mauve, with some basilar purple stripes; the lateral sepals are yellow, washed with brown and with broad purple veins; the borders mauve, and the lip dark brown, with green sides. The column is golden-yellow. Some plants bore five peduncles at one time. One had three spikes with forty-seven flowers and buds, thirty-four being open at one and the same time, thus presenting the appearance of a giant bouquet. *Vanda Sanderiana* is as profuse in producing flowers as Mr. Sander is in offering Orchids. I presume the plant is of Asiatic origin, for Asia has treasures of that kind. I feel much pleasure in naming the glorious plant in honour of Mr. F. Sander, whose energy in introducing Orchids is great. *H. G. Rehb. f.* [The dried flower we saw bears out the Professor's description, and had a superficial resemblance to a very large flower of *Odontoglossum vexillarium*. Ed.]

CATASETUM CHRISTYANUM, n. sp.†

This has quite the habit of *Catasetum saccatum*, Lindl., originally represented in Lindley, *Sertum*, 41. It was impossible not to think at the first glance of

* *Vanda Sanderiana*, n. sp.—Habitus *Saccolabii violacei*, Lindl.; lobis latoribus, pedunculis elongatis, multilobis; sepalis ellipticis; petalis cuneato oblongis obtusis minoribus hypochilio gibboso marginibus subquadratis; hypochilio triangulo obtuso. *Esmeralda Sanderiana*, *H. G. Rehb. f.*

† *Catasetum Christyanum*, n. sp.—Aff. *Cataseto saccato*, Lindl.; sepalis angustioribus; petalis minoribus serratis; lobis trifidis laciniis refractis filiformibus; ostio callucis compresso conici oblongo transverso; articulo rectilino postice laciniis erectis emarginatis. *H. G. Rehb. f.*

this. I have never seen anything quite like it. Messrs. Veitch, however, flowered the variety I called "pliferum," and which has been described in these columns. Mr. T. Christy's plant has narrower sepals and petals, the first darkest, reddish-brown, the second much lighter, perhaps at first ochre-colored, with innumerable brown spots, now looking uniformly lighter brown. There is a tendency to produce obscure teeth on the outside of the petals. The lip is quite distinct. Its blade is much smaller, trifid, the anterior lacinia obovate apiculate, bent down both sides like the inverted two-horned hat of an Italian *carabinieri*. The side laciniae are nearly square and blunt-angled. The border is adorned by numerous long, simple, or biind and trifid fringes, now green with purple margins, now altogether purple. They stand in a most irregular manner. I am afraid Miss Drake ruined her representation by making these fringes as straight and regular as the teeth of a small-tooth comb. The mouth of the spathe is square oblong, the anterior margin straight, the posterior surpassed by two upright emarginate lamellae. The lip is not of too strong a texture, light greenish yellow, washed with red on disc. It has flowered recently with one of my most energetic correspondents, Mr. Thomas Christy, Malvern, Sydenham, London, S.E., and may bear for a long time the name, provided his gardener knows how to rest an Orchid. On the Continent it is the fashion to kill *Catasetum vexillarium*, I know; but my friend, Herr Oberhofgärtner Wendland, of Berggarten, Herrenhausen, near Hannover, can show *Catasetum* grown for more than twenty years. Is there any English place where such veterans are kept? *H. G. Rehb. f.*

ODONTOGLOSSUM ANGSTUATUM (Lindl.) STYLITES.

There is no end of variations of this curious species. Mr. B. Williams sends a fresh one that has a styliform process on each side of the callus. It is rather curious. *H. G. Rehb. f.*

ODONTOGLOSSUM PESCATOREI VEITCHIANUM.

I had believed Mr. J. S. Bockett, Stamford Hill, London, N.E., had the finest varieties of this lovely thing. There are exquisite specimens of the dark purple blotched variety, "purpuratum," and there is one of the rarest specimen plants of Europe, a strong fine *Murellianum*, whereas the first plant that appeared with Mr. Hume was a weak thing. So much is Mr. Bockett's name connected in my mind with the best *purpuratum*, that I immediately thought of this gentleman when, last year, a broken tin box with only a part of a label came in my hand, containing glorious flowers of it. I never had any news about them.

Now, a fresh champion appears in the great arena, to match everything we saw before, at least for a while, till our excitement is so much over that we are once more capable to do justice to the elder plants.

It is a wide-flowered *Pescatorei*, quite *Pescatorei*, but with broad mauve zonal bands, and blotches, two on each sepal and petal, just forming an interrupted double circle, like Saturn's rings. It is glorious. No indication of any cross. There appears to be a single plant. All those who may possess specimens of this importation from Messrs. Veitch may do well to wait till flowers appear. The name is given to keep in memory the origin of this fine excitement. *H. G. Rehb. f.*

PHAIUS TANKERVILLI (Rehb.) FOL VAR. MARIÆSI.

This is shorter and broader in its floral organs than our common garden plant, and the median lobe of the lip is more prolonged than in our actual garden plant. The colours are more vivid, especially the cinnamon inner surface of the sepals and petals. The fresh leaf at hand is more plaited than the leaves sent by Messrs. Veitch, and than those at hand in Hamburg Botanic Garden of the same Veitch actual 3p. The representation in *Soc-moo Dructs*, plate 40, appears to belong to the same. I have at hand not only fine fresh materials sent twice by Messrs. Veitch, but also good specimens dried by Mr. Mariès in Japan some years ago. There can be no doubt that we have to do with a Japanese garden plant. Lucky Dr. v. Maximowicz, to be able to decipher the hieroglyphs of *Soc-moo Dructs*.

If we look to plate 1924 of *Botanic Magazine* we must believe that a very distinct variety was then grown in England with finer colours, especially a fine yellow throat of the lip with purple stripes. My wild Chinese herbarium specimens are much narrower as to the sepals and petals, narrower than those of the actual common garden plant.

As to the name, Blume is decidedly right in leaving the obscure *Phaius grandifolius* of Loureiro an unsolved riddle, provided there does not appear a typical specimen, which scarcely can be hoped. Yet it is quite an arbitrary *car tel est mon plaisir* of his that he changes the name, writing "Tankerville" (*Mus. Lugd. Bat. ii. 177*), or "Tankerville" (*Fl. Jav., n.s., 3*). *H. G. Rehb. f.*

POWDERHAM CASTLE,

THE picturesque seat of the Earl of Devon, is situated on the banks of the Exe, between 4 and 5 miles from Exeter, and about the same distance from the most fashionable sea-side resort on the South Devon coast, Dawlish. Starcross, which is rapidly growing into a place of some importance, is but 1½ mile distant, and the village of Powderham, from which the noble Earl's ancestors are said to have taken their name, is less than fifteen minutes' walk from the Castle. Powderham is said to have derived its name from the knight who possessed it in the reign of Edward I., one William de Ow, or Ou, who, after having served William I., proved unfaithful to William II., was accused of treason, and defeated in public combat at Salisbury by his accuser. From the Powderhams it passed to Humphrey de Bohun, Earl of Essex, and as the dowry of his daughter, Margaret, devolved upon her husband, Hugh de Courtenay, Earl of Devon. He, in 1350, settled it upon his fifth son, Sir Philip Courtenay, the direct ancestor of the present owner. The Castle was

remodelled and strengthened in the fourteenth century, and still retains part of its mediæval character, but has been greatly modernised and renovated. There are four entrances, the chief of which is from Powderham, which is the route to the ancient city of Exeter. The drive from Powderham is known as the Cedar avenue, from the fact of its being margined by two beautiful rows of *Cedrus Deodora*, which are in excellent health, and, as may be imagined, have a very fine effect. There are two flower gardens, one in a box, remarkably neatly laid out, and one in grass, laid out in scroll-like beds, both of which are distinct in character, and as geometrical gardens perhaps there is less formality about them than is generally the case with gardens designed upon the same principle. These gardens are upon the north-eastern side of the Castle facing the Exe. Upon the opposite side the "shrubbery garden"—a name which rarely does justice to the plants and trees which it contains—affords considerable variety not only for undulating surfaces, but also of fine trees and flowering shrubs. Foremost amongst these must be mentioned an avenue of evergreen Oaks, and a specimen of the common Oak surrounded by a rustic seat at the southern extremity of the avenue. There are so

many well grown specimens of choice Conifers in this garden, that the title of "shrubbery garden" hardly seems appropriate. The majority of the plants are certainly not shrubs. It is, however, more than probable that it was originally a shrub garden, and that the coniferous trees having taken the lead and monopolised the place of the shrubs, are encouraged to develop themselves into fine specimens, while the familiar title of the garden is still retained. Be that as it may, the appearance of the Wellingtonias, 58 feet in height, and large specimens of *Libocedrus chilensis*, *Cryptomeria japonica*, *Taxodium distichum*, *Abies lasiocarpa*, *Thuopsis dolabrata*, *T. occidentalis pendula*, the outline of which is both graceful and pretty, does not convey much idea of a shrub garden—and yet there are shrubs, and not a few of them either. Magnolias and *Rhododendrons* intermixed with Hollies are very pretty, the purple and white of the Magnolias and the scarlet *Rhododendrons* being strikingly effective among the Hollies. Fancy a group of this kind upon a green mound, then a valley again, ascending gradually, and having a single plant of the lovely *Picea Morinda* upon the

takes in a vast area of country of matchless variety and magnificence. If this is not a paradise upon earth it would be difficult to know where to go to find one. There is Topsham-on-the-Exe scattered along the river bank for more than a mile. There is Exeter, called by the Celts *Caer Isc*, the town or fort on the waters, with the stately towers of its cathedral glistening in the sunshine, and the beautiful seat of Lord Haldon lying upon the west, literally embowered in trees; and Oston Hall (E. Fairfax Studd, Esq.) in a valley surrounded by hills and plantations of trees, and which viewed from a distance gives one an idea of one vast garden laid out by Nature in her free and picturesque style. Mamhead Park (Sir Lydstone Newman) is also within view. Yonder, too, is Nutwell Court (Sir T. Drake), sheltered by the heights of Woodberry; there is Lympstone, where the Exe widens into a broad flowing channel; and, looking to the north-west, there is Exmouth and the Haldon hills. Through young plantations of Larch and Chestnuts and natural ferneries, which crop up here and there to the admiration of the visitor, the American garden is reached—that garden of all others

FIG. 92.—POWDERHAM CASTLE, THE SEAT OF THE EARL OF DEVON.

remodelled and strengthened in the fourteenth century, and still retains part of its mediæval character, but has been greatly modernised and renovated.

There are four entrances, the chief of which is from Powderham, which is the route to the ancient city of Exeter. The drive from Powderham is known as the Cedar avenue, from the fact of its being margined by two beautiful rows of *Cedrus Deodora*, which are in excellent health, and, as may be imagined, have a very fine effect. There are two flower gardens, one in a box, remarkably neatly laid out, and one in grass, laid out in scroll-like beds, both of which are distinct in character, and as geometrical gardens perhaps there is less formality about them than is generally the case with gardens designed upon the same principle. These gardens are upon the north-eastern side of the Castle facing the Exe. Upon the opposite side the "shrubbery garden"—a name which rarely does justice to the plants and trees which it contains—affords considerable variety not only for undulating surfaces, but also of fine trees and flowering shrubs. Foremost amongst these must be mentioned an avenue of evergreen Oaks, and a specimen of the common Oak surrounded by a rustic seat at the southern extremity of the avenue. There are so

slope, or a handsome bush of *Cephalotaxus Fortunei*, and something like an idea of the effect may be imagined, even if the image can afford but a faint indication of the reality. The planting upon this side of the Castle is in imitation of the earth's surface, irregular but not abrupt, wavy rather than formal. A peep is obtained from here of Exmouth, which was one of the principal ports in Devonshire during the reign of King John, and boasted of a fort or "castelet," designed to command the estuary of the Exe. It was also the first town on the Devonshire coast to put out of sight its fishing gear, in order to render the place acceptable to summer visitors.

From the shrubbery garden to the Belvedere Tower the walk through the deer park is delightful. The tower stands on the loftiest situation in the park, which is close upon 10 miles in extent, and was erected in 1773 by Lord Courtenay, and strengthened with a hexagonal tower at three of its angles. The deer, of which there is a fine herd, are moving about in groups upon the slope of a hill, or nesting at its base in quiet retirement, maybe shaded from the sun by a clump of Oaks just budding into leaf and giving tints in the landscape peculiarly springlike and beautiful. From the summit of the Belvedere the eye

where one is absolutely spell-bound by the great beauty and variety of the trees and shrubs.

The entrance to the American garden out of the "Grotto Garden," is bounded by two fine hedges of *Rhododendrons*, most of them of great age and of grotesque form when examined beneath the surface. At the back of these hedges fine evergreen Oaks are planted at intervals, and a tributary of the river Ken glides gently through the grounds at a few yards' distance from the walk. Presently the scene changes to something of a different character. It is true the water of the river is still of the same clearness, the herbage is of the same luxuriance, and the clear blue sky is not even bedimmed with a single cloud. Still there is a change, at which the visitor—even one who is no stranger to the beauties of a private garden—stops for a moment to admire. The hedges are left behind, and the eye has freedom to travel over acres planted with groups and specimens of rare trees and shrubs, some of which would not long exist out of the genial climate of South Devon. There are large Cedars of Lebanon, fine Tulip trees, and Douglas Firs from 80 to 90 feet high. Clumps of *Kalmias* are planted by the side of the running stream, and groups of *Rhododendrons* and hardy *Azaleas* are opening

their blossoms of many colours. The collection of hardy Azaleas at Powderham is among the finest in the country, and when in full bloom the different colours are said to give a fascinating effect—the luxuriance of foliage, and the variety of other trees and shrubs, tending in a great measure to produce an unrivalled combination of variety and colour. Magnolias grow and flower as freely as the commonest Rhododendron, some of them indeed are clothed to the ground with branches of unusually natural-like symmetry forming objects of great beauty when in flower or even leaf. I am, of course, referring to the deciduous Magnolias. Copper Beech make very handsome single specimens, and a remarkable specimen of *Abies cephalonica* is said to be the finest in England. The variety in this garden is endless, so to speak, owing to so many effects being created by arrangement. A grand clump of scarlet Rhododendron catches the eye on a slope, or a clump of *Deutzia crenata* *fore-pleno*, or it may be an established clump of *Gynerium argenteum*, or a group of *Phoridium tenax* by the brink of the river. But the startling sight to a stranger is the splendid specimen of *Eucalyptus coccifera* figured in the *Gardener's Chronicle* some years ago (vol. xii., p. 113). The colour of the bark is milky white, and the peculiar shade of the foliage upon willow-like branches is a pleasing sight indeed! The history of the plant, too, is a remarkable one. It was grown in a greenhouse as a young plant, and afterwards consigned to the rubbish-heap, from which it was taken by one of the garden labourers, and planted in its present position. The grounds have been altered since then, so that the plant occupies a worthy position, and as it has been planted over forty years and sustained little or no injury from 31° of frost registered at Powderham the year before last, its future safety may almost be accepted as a matter of fact—barring some untoward accident. There is also a nice sample of *Eucalyptus pulverulenta* (the White Gum-tree), but a very much smaller one, apparently a tender variety, and one requiring a good deal of nursing even in the climate of South Devon. Other notable attractions in this garden are the display of wild Cherries planted behind groups of green Hollies, a hardy ferny formed among roots of trees, and some of the largest bushes of Camellias in England—out-of-doors. The largest specimens are planted round the "Pavilion," from one of which (*alba plena*) Mr. Powell cut no less than 600 blooms in Easter week three years ago before the late severe winter, which it is to be regretted has seriously crippled them. A single red variety—a companion plant to the white one—measures 2 feet 9 inches in circumference at its base, but it will be some years before the plants recover themselves from the injury they have sustained.

The "Grotto Garden," located but a short distance from the walled-in garden, and leading to the grand new conservatory, is the last of the series of gardens within the private grounds. This garden is in process of being changed from a garden of geometrical nick-nacks into one more in keeping with the natural surroundings. It is overhung with splendid Beech, Limes, and Chestnuts, and margined with Hydrangeas and Camellias, some of the former of which are remarkable for size, and the colour and the profusion of their flowers. The garden is, of course, also broken up with other choice specimens, chiefly Conifers. The conservatory is upon the north side of the walled-in garden, and occupies a commanding situation. It is approached by three flights of steps, from the highest of which there are charming views of the Haldon hills, previously alluded to, Woodborough hills, and the little Haldon Hill jutting up like a black cloud. The village of Kenton nestles at the bottom of a fertile valley, and many other local objects attract the eye, but the conservatory and its occupants interest the horticulturist more than landscape scenery, however pretty. The structure is both ornamental and capacious. The central portion (the conservatory proper) is higher than the two wings which are devoted to the cultivation of stove and greenhouse plants. The structure was built by Messrs. Messenger, of Loughborough, and is designed and carried out in their well-known style, being light and ornamental as well as substantial. Circles formed out of bricks and cement are filled with choice named Camellias of all the leading kinds, which have made rapid progress and are trained into pyramid shape, but not stiffly. The two rows of circles are equidistant upon either side

the centre walk, and the remaining space is filled in with pot plants all in flower or approaching that condition. The roof is gay with *Clematis indivisa*, which has been flowering since the end of February, and upon the back wall are trained healthy and prosperous looking plants of *Luculia gratissima*, *Stigmaphyllon ciliatum*, *Bougainvillea glabra*, *Plumbago capensis*, and *Jessamines*.

To the greenhouse the show of spring flowers is of the usual kind—by usual, I do not mean of a mediocre type, for in good truth the display is a grand one. The same may be said of the plant stove, and more, therefore, need not be added, beyond naming a splendid plant of *Nephrolepis davalloides* furcans, in perfect health, and over 4 feet in diameter, and several other ornamental foliage plants and Ferns. There are 4 acres within the walls of the kitchen garden, and the south wall is covered with glass. The ranges of vineries contain fine crops of Grapes, thousands of bedding and other plants, and a magnificent stock of young Vines not much over twelve months old. Strawberries are forced in considerable numbers, and are bearing good crops, and Peaches are fine crops also, and the trees, or rather their leaves, having that ruddy bloom upon them which gardeners understand as the imprint of high cultivation. The numerous forcing structures need not be mentioned *seriatim* to convey to the reader the skill and responsibility entailed upon the cultivator who produces Pines, Grapes, Peaches, Melons, Cucumbers, and Strawberries in season and out of season, and who has to stock two flower gardens, besides growing and forcing large supplies of cut flowers. But of all the departments so ably managed by Mr. Powell none struck me more than the hardy fruit garden—such trees and such training as reminds one of the days when walls and wall trees were better attended to than they have been during the last decade. *Devonian*.

THE ROYAL ACADEMY.

THE exhibition of the present year appears to us to be decidedly below the average; there are but few pictures of great excellence or importance, and garden subjects and paintings of horticultural and floral interest are almost unrepresented. There are many good and truthful landscape pictures, and a considerable number of portraits, some of them excellent, others of no general interest. Many of the pictures call for no special notice, as they are neither uncommonly good or uncommonly bad; they are fairly correct, but show no unusual genius or inspiration. The absence of works by L. Alma-Tadema, with the exception of one superb portrait—181, "J. Whichcord, Esq., architect"—is greatly to be regretted; this portrait, however, is a most remarkable one, and well shows the great power of the artist both in drawing and colour. It is melancholy to see the number of would-be imitators of this artist's works both in the works exhibited at the Royal Academy and elsewhere; but it is pleasant at the same time to notice how easily and completely L. Alma-Tadema out-distances and eclipses his followers. Some of the latter think that by copying little bits of marble with brown joints, little objects of bronze, and a column or two with figures in what should be classic dress, that they put themselves on the same platform with Mr. L. Alma-Tadema. This is a great mistake, for the latter has an admirable knowledge of archaeology, of architecture, and of perspective, subjects in which his imitators generally fail in the most miserable manner. One represents the genuine gold coin, the other the Hanoverian counter of brass. One of the first and best portraits is 23, "Lieut.-General Sir Frederick Sleigh Roberts, Bart.," by W. W. Ouless. Near this is one of the best efforts of Mr. J. E. Millais, in 29, "Portrait of Mrs. James Stern." A very attractive picture, showing all the well known power of this artist in painting animals, is 24, "The Magician's Doorway," Britton Riviere, R.A., the tiger-guarded entrance to the house of some Eastern magician; the drawing and painting of both the animals and the architecture is very good. 71, "Wedded," by Sir F. Leighton, P.R.A., is a beautiful picture, and, like all this artist's works, shows his perfect knowledge of figure drawing. 219, "Ossian's Grave," John MacWhirter, A., is an admirable painting of a storm passing over Scottish rocks and mountains. In the foreground is a *menhir*, or "standing stone," supposed to mark a grave;

the weird solitude of the place seems to us to be broken by the presence of the sheep. 224, "In the Tepidarium," by E. J. Poynter, R.A., is a classic picture of a girl at a bath, displaying this artist's well-known knowledge of figure drawing and architectural details.

Passing 229, "Oranges and Dates," Edith Elmore, a picture which shows an advance on former pictures by the same hand, we stop to admire the superb landscape at 289, "Abingdon," by Vicat Cole, R.A., and to smile at the humours of 314, "Justice is Not Always Slow," by J. R. Herbert, R.A. 333, with some lines of poetry about a "Thick Red Flame," by Rose Marshall, is apparently a picture of Poinsettias and Epiphyllum truncatum, but the plants are so badly drawn and coloured, at any rate from a horticultural point of view, as to be hardly recognisable. 351, with further poetry, and by the same artist, is an equally unsatisfactory picture of the *Richardia*, with *Azaleas*, *Begonias*, &c. The picture close by, 339, "Winter Roses and Almonds," Harry J. Thunnell, is a much better picture of *Heliolebes* and Almond blossoms. 352, "Paeonies," H. Fantin, is a much better painting of flowers, according to our estimation, than we have seen before by this artist. 355, "From the Riviera," Annie Mutrie, shows the flower and fruit of the Lemon, whilst 367, Annie E. Hartling, shows the Shaddock. It would be far better if these pictures (and many others) were properly named. 468, "The King Drinks," Britton Riviere, R.A., is an excellent but somewhat rough painting of a drinking lion. Two of the best landscapes in the Royal Academy are to be seen in 725, "Three Counties from Whetham Hill, Petersfield, Keeley, Halswell," and 737, "In the evening there shall be light," E. W. Leader. 768, "The Garden of Bingham Rectory, Nottinghamshire," Frank Miles, is a very pretty picture of flower-beds crowded with Poppies, Lilies, Aconitum, Iris, Clematis, &c. 807, "Buttercups and Daisies," Letitia M. Parsons, shows a group of Dog Daisies with a few field Poppies, &c.

Coming now to the water-colour drawings, we have a large number of little sketches, few of which demand any remark; they are precisely the same as the other little sketches which have been so familiar to all visitors to the Academy for the last twenty years. 912, "Roses," Gloire de Dijon," Constance Lawson, every rosarian will term a pictorial libel on the grand Rose mentioned in the catalogue. 931, "Poppies," Caroline H. Norman, is fairly well done, but the leaves are ill-drawn; 999, "Christmas Roses," shows considerable artistic power; whilst 1009, "Japanese Primroses," Georgina de l'Aubiniere, is remarkable for its badness. 1093, "Sunflowers," Maud Nagel, is a beautiful little picture of Sunflowers in a garden bed, with red and yellow *Nasturtiums*. 1432, "Una," Britton Riviere, R.A., is another excellent picture of Una with the lion. 1464, "Christmas Roses," Charles Stoney, is a good picture of *Heliolebes*,—there is a flood of *Heliolebes* this year in the picture exhibitions.

One of the last pictures to be noticed is 1465, a truly admirable portrait of Charles Darwin, painted for the Linnean Society by John Collier. The Linnean Society may consider itself fortunate in possessing this really excellent and life-like picture of the man who has so profoundly modified and directed the scientific thought of the whole world. This picture will no doubt attract great attention from all visitors to the Royal Academy this season, for the great master is painted in so life-like a manner that one might almost fancy he could speak or walk from the canvas; it is most fortunate that a picture of this class was secured during the lifetime of Mr. Darwin. 1497, "Autumn in New England," representing the collection of Apples into heaps in the autumn, is an excellent landscape. 1514, "His Eminence Cardinal Newman," J. E. Millais, R.A., is one of this artist's very best works. Our space precludes notice of many excellent landscape pictures and some sea-pieces; but if our readers simply notice the pictures we have mentioned above, they will be well repaid for a visit to the Royal Academy.

CALCFOLARIA DEFLEXA is a Peruvian species, introduced to this country by Messrs. Rogers, McClelland & Co., and distributed by them under the name of *C. fuchsifolia*. It makes a good pot plant for cool-house decoration, has *Fuchsia*-like leaves, dark green above and silvery below, and large, bright yellow flowers.

COMELY BANK NURSERIES.

AMONGST various Australian plants grown in the long established nursery of Messrs. Cunningham, Fraser & Co., at Comely Bank, Edinburgh, the following kinds of Grevilleas are now in blossom:—*G. punicea*, with bright crimson flowers; *G. rosea*, shaded pink, a very dwarf kind; *G. rosmarinifolia*, shaded crimson; *G. sulphurea*, pale yellow. The leaves of these kinds are small and entire, the foliage and habit of *G. sulphurea* somewhat resembling that of a small Larch, and that of another species being still more like *Andromeda polifolia*. Prettiest of all is *G. Preissii* with shaded crimson and pink flowers, and small finely cut foliage. Even without its flowers this plant would be worth growing, but the blossoms of Grevilleas are so strange, that no collection of Australian plants, however small, should be without specimens of them.

Grevillea acanthifolia has leaves like a small *Acanthus*; its pinkish flowers grow in a long spike, instead of the round heads of flowers of most species. It is described and figured in vol. 55 of the *Botanical Magazine*, from a plant which flowered at Comely Bank in April, 1828. This plant was discovered by Mr. Allan Cunningham in peaty bogs, on the Blue Mountains, and banks of Cox's River, during Mr. Oxley's first expedition into the interior in 1817.

Acacias are well grown in this nursery, some of them, especially *A. grandis* and *A. pulchella*, with finely cut foliage, being trained into miniature weeping trees, from 1 foot to 1½ foot high, and bright with golden balls of blossom. *Acacia verticillata*, the foliage of which is verticillate and the leaves very small, has long brush-like flowers of pale yellow. Small standards or bushes of the following kinds are also grown, *Acacia armata*, *A. hybrida*, *A. hispida*, *A. Riccaana* (of which *juniperina* is probably a synonym), *Pitceca subumbellata* with a yellowish-pea flower, now out of blossom; *Leschenaultia intermedia*, an orange flower with Heath-like foliage; and *Bossia microphylla*, are good plants. Mr. Fraser grows these and various other Australian plants in a winter temperature of from 35° to 55° Fahr. *Cytisus Everestianus*, grown in the same house, is brilliant gold colour and very effective.

Rhododendrons of many kinds are grown at Comely Bank, a border of *R. procerum superbum* (now out of flower) must have been worth seeing. Some white and pale lemon varieties of *R. caucasicum* are replacing the earlier kinds. Amongst other flowering shrubs the semi-double Japanese Cherry (*Cerasus japonica*), with pale pink flowers, the double flowering Almond, and *Prunus sinensis alba plena*, are beautiful; *Magnolia conspicua* is also in full blossom, and *Daphne finlayana*, and the pale yellow *Genista procerum*. Amongst very dwarf alpine shrubs *Ledum luxifolium*, *L. thymecifolium*, and the still smaller *L. canadense* (*droseracifolium*) are but a few inches high; *L. palustre*, somewhat taller and with larger flowers, is also in blossom, and *Pernettya speciosa* promises soon to be a mass of flowers, blossoming much more freely than either *P. angustifolia* or *P. mucronata*. In the large collection of hardy Heaths there must be a succession of kinds in flower during a good part of the year, as last August there was a beautiful display of flowers—including many varieties; and now, in April, various kinds are in full blossom, and two or three kinds almost over, including the light pink *Erica carnea*, grown here as *E. herbacea*; the dark red form being grown as *E. carnea*, though Mr. Fraser considers both to be varieties of the same species, the latter being a rather later kind than the former. Every two years the Heaths are replanted and earthed up like Box, the result being that no bare stems are to be seen, and the plants flower freely when but a few inches high.

Rubus arcticus grows and flowers well, and the *May Flower* (*Epigaea repens*) grows luxuriantly, as does also the golden-rooted *Copis trifoliata*.

There is one plant of the rare *Helonias lutea*, and growing near it is *Gaultheria procumbens*, still bright with berries.

Iris obliensis vera resembles *I. pumila* in habit, but is a very deep purple in colour. *Thalictrum aquilegifolium rubrum* is a pretty and distinct variety, its flowers being dark pink. *Botryanthus Szovitsianus* (under which name it has long been grown here) resembles *Muscari racemosa pallens*, but has flowers of a rather larger and deeper blue, and outlasts the latter in bloom. Mr. Fraser grows both, but thinks the former decidedly the better variety.

The collection of alpine and other hardy plants at Comely Bank must be full of interest to any one who cares for their cultivation, as it contains many rare plants. *C. M. Owen*.

THE AURICULA.

WILL you allow me to make an addition to the very interesting lecture by Mr. Shirley Hibberd on the Auricula, which has been published in your issue of last week? I think the following will help to clear up some matters as to the flower's antiquity, more especially as regards the Dutch having brought the best over with them. It will be noted, on perusing the subjoined, that all the Dutch plants are expressly stated to be without dust, and those that are powdered all come under the heading of "Painted Ladies," perhaps on account of the fair sex of the period using paint and powder to adorn their natural loveliness. However this may be, so they are called, and here we get the first mention, as far as I know, of pure white-edged varieties. Honour and Glory is so described, and so, according to the steel plates, is also the Royal Widow and Danaë. It will also be observed that it was most unusual for an Auricula with a white eye to come from Holland, so I take it the Dutch varieties were those we now designate alpine. Mr. Shirley Hibberd, in his careful and elaborate lecture, has placed the year 1750 as the furthest date of any mention of the names and properties of this now very fashionable plant, so it is with much pleasure that I am able to carry the date as far back as 1734, and this is also the second edition of the book from which I take these notes. Many of the engravings are well done, and the descriptions are apparently truthful; also it is very interesting to know, even at that time, that one plant would fetch ten guineas.

"The Flower Garden Displayed, &c., &c. By Sir Thomas Moore, Part. Second edition. London: 1734."

"March.—The Royal Widow Auricula is one of the best of those called Painted Ladies. It brings a good truss of flowers, well powdered, and is marked with crimson streaks now and then mixed with purple and some yellow here and there in the mixed, and the centre of the cup is yellow likewise. This Auricula was raised from seed by Mr. Adam Holy, a noted gardener, and was so much esteemed, that a plant was sold for ten guineas. It is not very subject to bring increase, which is the occasion that it blows very strong, as it is the case with all other Auriculas that are small in increase. And on the contrary, those which increase much, or put forth many off-sets, bring weaker flower stems in proportion."

"This flower, as well as all others of the kind, must have fresh earth put on the tops of the pots in January, and the plants should be exposed to the sun in a place where they may be covered with mats or such-like in extreme frosty weather, or when the winds are sharp and blighting; for in January some of the flower trusses begin to appear, and are subject to receive injury by cold if they are not protected, and then you may expect a good bloom about the beginning of April—but this sort will come somewhat sooner than the rest."

"As soon as this or any other begins to open its blossoms, set them in your stand under a shelter that may remain to cover them while they are in flower, for the rain coming on them will clear or wash off their dust, and then they will lose their beauty."

"Let your stand or station or shelves be so placed as to receive only the morning sun, or else you must be obliged to have a cloth to hang before them to shelter them from the sun's heat, in order to keep them longer in flower."

"Towards the end of their flowering, you may take off their off-sets, and plant them out in small pots filled with light earth, or you may let this work alone until midsummer; remembering to set them in the shade after planting; and keep them from too much wet in the winter."

"As I am upon the article of the Auricula I must likewise direct how to raise that plant from seed. In February fill a box with the lightest earth you can get, and sow the seed on the top of it; then press it down with a board and cover it with a net to preserve it from the birds. Let this be well exposed to the sun, and water it every day till it comes up, then set the box in the shade till Midsummer, and plant out your seedlings 4 inches distance; water them well at first, and shade them in the daytime for three weeks, and the next spring you need not doubt but some of those plants will bring you fine varieties of flowers."

"The *Danaë Auricula* was raised in Holland. The flowers are of a bluish-purple striped with white. It has a very light eye, and in the middle the pipe appears of a bright yellow, which render the whole very beautiful.

Its manner of culture is the same in every respect as the Royal Widow.

"*Glory of the East Auricula* is a flower that brings large trusses; it has a good eye, and is as well powdered as any other of the Painted Ladies. It is striped with a carmine colour, and free in making off-sets for increase."

"*Love's Master Auricula*.—This is a very double flower, and brings a good truss. The flowers are yellow, striped or rather shaded with a dark buff colour, such as a Dutch Pink. It will bear the weather, for it has no dust upon it to be washed off by the rain."

"*Double Painted Lady Auricula*.—This Auricula is, like the other Painted Ladies, covered with dust, which makes the ground of the flower to appear white; this is striped with yellow and with a little carmine colour."

"*Merveille du Monde Auricula*.—This plant was received from Holland, where it was raised. It is a plain flower, but it is of so fine a colour that it looks like blue velvet. The eye is white, which is contrary to most Auriculas received from Holland, which are generally yellow eyed, without any dust upon them."

"*Duke of Beaufort Auricula*.—This is one of the strangest flowers of the list, because it is striped with blue upon white, which none others are. The Auricula which was raised by Mr. Holt, called the Royal Widow, he told me came from the seed of this. This plant should be had in good numbers, for sometimes the flowers come all white, when some among them will blossom with trusses of good striped flowers; so 'tis best to have a collection of them in a bed, and as you see them blow well take them out of the ground with earth about them, and, planting them in pots, place them in your collection."

"*Duke of St. Albans Auricula*.—This is a good trussing flower, and opens its blossoms well. It has a good eye and is well powdered, and striped with a carmine colour upon a buff-coloured ground."

"*Grand Provence Auricula* is one of the Dutch flowers. It blows with a great truss of flowers, and the blossoms are very large, of a dark red colour, and a large yellow eye. 'Tis managed in the garden like the Auricula called the Royal Widow, but it has no dust upon it. A shower or two will not make it lose its beauty. It is very subject to increase by off-sets, and makes a fine appearance in a collection."

"*Royal Purple Auricula*.—This is of a pale purple colour, striped with a deeper. It has a white eye and trusses well."

"*Semper Augustus*.—This Auricula is a good flower. Its blossoms are of a Painted Lady kind; a white ground striped with reddish-purple."

"*Shelton's Heister*.—This is a fine one, of the Painted Lady sort. The flowers are striped with yellow and crimson, upon a ground of white."

"*Honour and Glory*.—This flower has a good white eye, and the flower is striped with a dark reddish-purple on a white ground, so as to leave the edges of the flowers white."

There are thirteen sorts in all enumerated, named, and described, several of which are figured in the steel plates accompanying the book. *Harrison Weir*.

THE GALE OF APRIL 29.

THE fearful wind-storm of Saturday last has left behind traces that are too evident of its course, and its blighting and destructive influences have been widely and disastrously felt. That it was less fierce than was the too-famous storm of October last there is good reason to doubt, but if its track has been marked by the downfall of fewer noble trees, it is doubtless chiefly due to the lesser quantity of leafage on them to arrest the wind in its course. But the new and tender leafage has greatly suffered, and specially on Pear trees of various kinds the mark of the storm track is left as forcibly impressed as though it had been that of a modern destroying angel. On the windward side the foliage, young, tender, and beautifully fresh before the storm, is now blasted and seared as though with fire, whilst unsubstantial fruit germs litter the soil thickly. Plums have perhaps suffered less, because the tiny fruits offer less resistance to the wind, and the leafage is firmer. Apples, though largely in bloom, seem not materially to have been injured, except in very exposed places, where, all round, very much mischief, it is feared, has been done. Many noble trees, Elms especially, have been laid low, and giant limbs torn and twisted from their main stems as though matchwood. What a deplorable sight did gardens and pleasure-grounds present on Sunday morning! How strewn with the fallen branches and leafy debris of shrubs and trees. One beautiful ground then resembled a wilderness. Gardeners have much to be thankful for in Nature, and very much to fear, and of the latter none come with more dread than fierce

winds and blasting hurricanes. Such a visitation as that of October last was enough to make a lifetime; but Nature seems disposed to crowd phenomena now into short epochs, and just as we have in human life become accustomed to dreadful accidents as almost of ordinary course, so does it now seem that natural phenomena are becoming by their frequency commonplace and unexceptional. We will none the less hope that a quiet and prosperous season is yet in store.

— A terrific storm of wind from the south-west, accompanied with rain, passed over this part of the country on Saturday afternoon. It began in a gale at 3 P.M., and soon got up to a perfect hurricane, and was at its worst about 5 o'clock. The wind could not be travelling at less than 90 or 100 miles per hour, sweeping nearly every movable thing before it. Noble trees which had stood centuries were blown down by scores and hundreds, the Birch and Spruce being especially uprooted; but even the Beech and Oak had to give way, and the Horse Chestnut had its leaves torn to shreds; and that hardy tree, the Horn-beam, had its leaves blackened. In the garden lights were uplifted and smashed, standard trees blown down and broken off. The Pears suffered terribly, especially that delicious kind, Louise Bonne of Jersey, which looked this morning as if it had been syringed with boiling water. But even the Strawberries in the open garden had their leaves blackened, while the protecting material on the fruit walls was torn into ribbons. Such a gale at this season of the year is not remembered by the oldest inhabitant. The fruit crop has unquestionably suffered immensely. The gale was foretold from America, and if it was a day later than advised, it came with interest attached. In a garden 2 miles off, down in a valley, and well sheltered, little or no damage was done. The moral is, Landed proprietors, think twice ere you cut down the shelter of your gardens; and to those who have not sufficient, lose no time in planting for that purpose. *F. Knut, Eridge Castle, Tunbridge Wells.*

— The hurricane has left such marks behind it in this district as will be seen for the rest of the season. Vegetation has suffered terribly; that which a few hours before looked bright and full of promise being mangled and blackened beyond belief. The early Pears and Peas have suffered most; the crops on the latter in many instances are entirely lost. Those on the walls have not escaped the terrific force of the wind, the upper half of the trees on the south-west walls being in the same plight as the standards and pyramids. The forest trees have not escaped; quantities are uprooted in all parts; the Chestnuts in many places are almost denuded of foliage; the early varieties of Beech have the same appearance as the Peas—quite black where fully exposed. The rocks, too, have come in for their share of the suffering, two colonies here having lost most of their young, which may be picked up at the base of the trees not only by dozens and scores but by hundreds. The force of the wind far exceeded that of the gales of last month and October, 1881, in this neighbourhood. The gale lasted from 2 o'clock P.M. till 9 P.M. *P. Conway, Manton Court, Woking.*

— Herewith I send you evidence of the dreadful hurricane we had here on Saturday night last. On Saturday morning everything looked as green and flourishing as could be desired, but on Sunday morning—well, the evidence I send you will describe it better than I can. Gooseberries, Currants, Raspberries, and Strawberries have nearly escaped, being sheltered from the south-west by a good thickness of shrubs. Peaches, Nectarines, and Apricots will be safe as far as the fruit is concerned, but Peas and Plum trees just set with fruit look as black as the proverbial tinker. Apples are neatly as bad, but all the flowers were not open, so that some may escape. The samples of Beech, Chestnut, and Sycamore are from young trees not more than 2 feet high; near them are growing Corsican and Austrian Pines, Larch, Douglas Spruce, and other Conifers quite unharmed. The air was charged with salt, for yesterday I could scrape the salt off some iron hurdles where it was deposited. I may add that we are situated at least 5 miles from the sea in the direction the wind came from. *John Gore, The Gardens, Glenhish, Hastings.*

— On the morning after the great gale of Saturday, I found the windows of my house, situated 20 miles north-east of Portsmouth, to be entirely crusted with salt. The effect upon the young foliage has been frightful, each leaf being shrivelled as if by a hard frost. The Lime trees and Horse Chestnuts

have suffered most, being quite black, while the Oaks and Elms are but little better. The only early shoots that have escaped are those of *Abies cephalonica*, which have this year been untouched by frost. *H. K.*

— The gale of Saturday last has done an immense amount of damage in this district, everything exposed to the wind having suffered terribly; fruit and forest trees look as if they had been scorched by fire. The Potato crop in many places is completely destroyed, the haulm cut off or blackened as badly as if we had had 10° of frost. Apple trees on the windward side are denuded of leaves and blossoms, and on the sheltered side of the trees the blossom is sadly bruised, and the prospect of fruit is very slight indeed. The farmers, too, have suffered very much, Wheat and grass looking as if rolled with a hot roller, and to-day (May 3) the effluvia from injured leaves, &c., is quite unpleasant. *Charles Clark, Treverno Gardens, Helston, Cornwall.*

FLOWERS IN SEASON.

CLEMATIS MONTANA GRANDIFLORA.—Of all the hardy varieties of the Clematis family none exceed in richness and beauty the pretty little *Montana grandiflora*. In Devonshire the plant is commonly grown as a creeper for covering the walls of cottages, bothouses, and it will even cover a slate roof, and grow and flower there. Its marvellous floriferousness at Luscombe Castle, near Dawlish, is fascinating in the extreme. Trained under the ledge of the Castle roof it extends the full length of a wing of the building, producing a perfect mass of its pure white flowers, which hang in graceful festoons a distance of over 3 feet. Nor is it less useful for forming arches over basket-beds, or over walks, or for ornamenting entrances to plant-houses. It can hardly be planted amiss if there is anything to fasten it to loosely, and in most other respects it may be left to take care of itself.

HELIANTHEMUM ROSMARINIFOLIUM.—This is a distinct looking plant now in bloom on the rockwork at Chiswick. It grows in the form of an erect little bush about 1 foot in height, and produces white erect cup-shaped flowers. It is a capital plant for the rockwork or border, but needs a well-drained and rather sandy loam.

TWO EVERGREEN CANDYTUTES.—One of these is the pretty dwarf-growing *Iteira fruitii*, which blooms with remarkable freedom, and produces large umbels of well-formed pure white flowers not unlike those of *L. catifolia*. It is a capital rock plant, forming neat little tufts of a distinct character. The other is *L. superba*, which may be best described as a superior form of sempervivens with larger and better formed flowers. Both are well deserving of culture.

FRENCH HAWTHORN.—With this title London refers to *Catalpa oxyacantha*, var. *obtusata*, which is now flowering splendidly in the Cambridge Botanic Garden. It is by far the earliest of several varieties, and yields to none in point of beauty. The flowers are pure white, and the tree is graceful in habit. It is one of those varieties which differ from the common Hawthorn in the form of the leaf, and is easily distinguished from others by very obtuse lobing. The particular value of the tree is in its early flowering.

HUSTONIA CURTISIA.—This gem among diminutive plants, known as the Bluets, is flowering well on the rockwork in the Cambridge Botanic Garden. Its position is not that which would usually be accorded to it. Instead of being in a moist corner, where generally it is understood to flourish best, and to be most under natural conditions, it is here, by accident, in the driest and most exposed spot that could be found. It is flourishing, however, and forms a tuft of great neatness and beauty.

TULIPA GESNERIANA.—It is doubtful if gardeners fully appreciate the rare beauty of this superb species as a border flower. It has the advantage of being late, coming into flower after the early Tulips, and keeping up the succession of flower. Now that the somewhat unattractive late Dutch Tulips are being banished from gardens, the rich vermilion of *T. Gesneriana* can take its place, and

when planted in good soil it speedily establishes and extends itself. What a telling plant for the rock garden it makes can now be seen at Chiswick; and one of the most successful of Mr. Barron's *cups* this spring has been his judicious use of early and late Tulips. They have been objects of great beauty, most conspicuous being the finest and showiest of all the early Tulips—Keiser's Kroon, in company with scarlet Van Thol, Proserpine, White Pottebakker, the rich crimson Couleur Cardinal, and others.

HIERACIOLIE BOREALIS.—In the bog ground of the Cambridge Botanic Garden this British grass has been flowering in the most lovely manner. It is really pretty, and with cut flowers is quite charming. Its perfume is delightful. Here it grows in luxuriance along the edge of the water, and takes care of itself. It is widely distributed, though known in Britain at Thuiso only. Formerly there existed the practice in Germany of strewing it before the doors of churches on festival days.

SALVIA INTERRUPTA.—This beautiful North American species is one of the handsomest for greenhouse decoration. In the Cambridge Botanic Garden it is finely in flower, and reaches a much better development under glass than it does out-of-doors. It has lived through the last three winters on the rockwork. The flowers are pale blue-purple, and grow in large racemes. It was figured some years ago in the *Botanical Magazine*.

CORYANTHES MACRANTHIA.

Is there, can there be, a more strange looking Orchid than this (fig. 94, p. 597)? A Stanhopea is singular enough in appearance, but this is even more grotesque, and yet by no means destitute of beauty—the beauty that astonishes and captivates, because strange and widely divergent though it seems even from such out-of-the-way flowers as Orchids in general, a very little examination suffices to show that this seemingly anomalous creation has in all essentials the structure of an ordinary Orchid flower. It is strange, but the symmetry is only disguised, and it is really as normal as that of any other Orchid. In most Orchid flowers there are three sepals, three petals, one of which is modified to form the lip, and a column consisting of stamens and styles united. In this *Coryanthes* all the parts we have mentioned are present. In the illustrations (fig. 93), S, S, L, S represent the lateral sepals; U the upper sepal; P, P the petals; L the lip; C the column; PA the pollinia; ST the stigma; O the ovary. The circumstances which render this flower so very remarkable depend upon its pendulous direction, the central axis of the flower being at first bent downwards so that the tip of the column C, where the anther is placed, PA, instead of standing erect or somewhat horizontal, as it does in most Orchids, is bent downwards. From the base of the column project on either side two horns, H, H, the purpose of which will be shown further on. At the same time the lip L presents a most extraordinary series of modifications. In the first place, as to its direction, it is bent backwards, then downwards, then upwards, so that seen in section it resembles the letter C, or with the column, the letter O; there is in fact a cylindrical stalk stretched horizontally backwards, and which expands into a thick fleshy purplish-brown plate projecting backwards, called in the sketches the "basal plate of the lip"; then comes another thick stalk-like process bent downwards, parallel in direction to the column. This again expands below into a large bucket-shaped body, 1, rounded at the back like the slipper-like lip of a *Cypripedium*, and which leads to the impression when it is turned towards the observer that it is the front of the flower, when in reality it is the back. The lip is open in front to receive the end of the column, which fits closely into the aperture, and is three-lobed at the apex, the central lobe prolonged at the apex into a tooth-like process directed upwards so as to come into contact with the end of the column. A reference to our figures will do more to make this structure intelligible than words can do.

Let us now see what is the meaning of this extraordinary arrangement. From the base of the column, or as it would appear, from the inverted position of the flower, from its top, project backwards, as has been said, one on each side, two horns, H, H, which overhang the cavity of the bucket, and descend into it drop by drop a limpid fluid, as might be seen when the plant was exhibited, and which our artist has indicated by dotted lines. Insects, such as bees, visiting the flower, alight on the

thick, flat plate, and are stated by Dr. Cruger, who frequently witnessed the fact in the West Indies, to gnaw its fleshy substance and the interior lining of the labellum for food. Such attraction has this for them that they may be seen disputing with each other for a place on the plate and its vicinity, and in the contest some of them are pretty sure to be pushed off and fall into the bucket in the direction shown by the arrow ↓. To extricate themselves from their bath, the insects must crawl up along the anterior side of the bucket ↑, so as to reach the orifice left le-

dettered by its prior immersion, visits the same or another flower, goes through the same performances as before, and in its struggles to escape now deposits the pollen upon the stigma, sr. Dr. Cruger tells us he has "often seen this, and that sometimes there are so many of these humble bees assembled that there is a continual procession of them through the passage specified." The liquid distilled into the bucket is, it appears, so slightly sweet, that it does not deserve to be called nectar, and does not itself serve to attract the insects. The attraction for insects is the fleshy plate

account and compare it with Mr. Worthington Smith's accurate illustrations, quite bears out the wonderful history just given.

The plant from which our figures were taken was exhibited before the committees of the Royal Horticultural Society at one of its recent meetings by Sir Trevor Lawrence, who kindly placed at our disposal the flower from which the accompanying illustrations were made. It is difficult to over-estimate the keen interest a flower like this excites in the mind of a naturalist. He is as much struck with the weird beauty and strange appearance of the flower as h's

FIG. 93.—CORYANTHES MACRANTHA.

The upper flower to the left is seen from the front, that to the right from the side; the Lower flower to the left has the back of its lip turned to the spectator, the figure to the right is a section through the flower. For explanation of the letters see the text.

tween the upturned tip of the lip and the downturned apex of the column, as shown by the direction of the arrows in the cuts, and especially in the section shown at fig. 93, at the lower right-hand side. At the apex of the column—which it will be seen is bent a little horizontally as well as downward—is the anther with its pollen-masses, PA., so that when the half-drowned bee struggles through the aperture formed by the tip of the lip, L, and the tip of the column, C, it inevitably removes the pollen, PA., from the anther, the pollen remaining affixed to its back. Then the insect, un-

der the fluid secreted in such large quantities in the bucket is to wet the wings of the insects and prevent them from flying away, as they might otherwise do, were the bucket dry and empty. The attraction for the bees in the first instance resides in the smell of the flower, the same insects visiting *Coryanthes maculata*, *Stanhope grandiflora*, and *Gloxinia maculata*, all three of which have the same perfume. Such is the story narrated by Dr. Cruger and Mr. Darwin, and although in our hot-houses it may never fall to our lot to see the whole process, yet the construction of the flower, as any one may see who will read the

fellows, and he has the intense pleasure of seeking and of finding the explanation of all these remarkable modifications, and of admiring the marvellous adaptations to purpose and design which they show, and yet, when the key is found, all this apparent strangeness of form and disposition is seen to resolve itself into the ordinary Orchid-type of construction.

AMARYLLIS AT HOLLOWAY.—Lovers of these fine plants will find Mr. B. S. Williams' collection worthy of inspection just now, many good forms being in flower.

Orchid Notes and Cleanings.

WORK IN THE HOUSES.—As external influences are now favourable for promoting healthy growth, a generous system of treatment may be adopted with safety, and the maximum temperatures should be maintained in the different houses. The East Indian-house should stand at 70° at night, and from 85° to 90° during the day. Where the *Aerides* and *Vandas* are grown in the same house, the latter should be placed in the coolest and airiest part of the structure. The Mexican-house should stand at 65° by night and 75° by day, and the cool-house from 55° to 60° at night, and ranging between 60° and 70° during the day, according to the state of the weather. If the cool-house is fully exposed to the mid-day sun it will be difficult during very bright weather to keep it down to the day temperatures given above; and when this cannot be done without admitting a greater volume of air than can be kept charged with moisture, it will be safer to run up the temperature a few degrees than to expose the plants for any length of time to an arid atmosphere. Those who are fortunate enough to be able during summer to accommodate the cool species in a house of low elevation facing the north, will find the difficulties attending their culture much lessened. On bright mornings the blinds should be run down before the sun gets fairly on the house, to prevent the temperature from rising unduly. All the *Odontoglossums* and *Masdevallias* must now be treated very liberally at the root, and all available surfaces in the house should be damped over several times daily. Under these conditions, if the material about their roots is sweet and porous, and the drainage of the plants perfect, they will now make satisfactory progress. Several of the *Odontoglossums* that have been wintered in the Cattleya-house should now be placed in the cool house. The two best of these are *O. thalassopis* and *O. naxium majus*; *O. vexillarium* and *O. Roezlii* will now be in flower or rapidly advancing towards that stage, and will take a liberal supply of water at the root. The latter is one of the most difficult to maintain in health for any length of time. Some succeed with it for a time in strong heat, but the healthiest pieces I have yet seen were at Ashton Court, Bristol, and these were growing in a cool-house facing north or north-east. When grown in heat it requires constant attention to keep it free from thrips. *Odontoglossum hastulatum* will now be throwing up its fine branched spikes, and a good form of it is a very desirable Orchid. It requires an intermediate temperature. The deciduous *Calanthes* will be commencing to root freely, and will be benefited by a gradual increase of water. Avoid overcrowding the plants, and keep them close to the glass in a high temperature, fairly charged with moisture. The *Phalaenopsis* should now be showing signs of activity at the root, for, if the old roots have been well preserved through the winter, young ones will now be coming out of them freely, and if the plants are in this satisfactory state it is the best precursor of healthy foliage. All mossing over or rebasketing of established plants of these should be brought to a close as speedily as possible, and a high degree of heat and moisture must be maintained around them; and any of the plants that are showing their young foliage must not be allowed to suffer for the want of water at the root. Some extra provision for supplying moisture to the house during summer ought now to be made. For this purpose no material is cleaner or holds moisture better than coco-dire, and a good body of this placed under the stages will be of great service during hot sunny weather. *J. Roberts, Gunnersbury.*

ORCHIDS AT HOLLOWAY.—There is a fine display of flowering Orchids just now in the Victoria Nurseries at Upper Holloway—many hundreds of spikes of *Odontoglossums*, *Masdevallias*, *Cattleyas*, *Vandas*, &c. Mr. Williams has sent us some flowers of varieties of *Odontoglossum Alexandri*, which are very large and of fine form. He informs us that they are from one of his recent importations, as an illustration that all the recent importations are not inferior to those received years ago (as we have seen so much written about lately); many of these, instead of being inferior to older plants, are greatly superior.

MASDEVALLIA ROSEA.—We are informed that this rare and beautiful species is now in flower in the collection of M. D. Massange, D'Uthoville, Belgium.

The Poultry Yard.

THE EGG TRADE.—During the first four months of the year the trade in eggs for hatching is something enormous. Thousands of sittings annually change hands, and prices range from 3s. 6d. to 42s. the sitting. Many who have fowls of high and well-known quality find it a paying concern; but, besides this, others, besides ourselves, regard it as a troublesome matter, and prefer rearing stock and selling them to selling the eggs. Some customers who understand all about fowls and the many slips between the laying and the hatching, never count their chickens until they see them; but others—and they are by no means few—count them from the day they buy the eggs, and when one and all do not “come out” on hatching day, the seller is sure to receive one or more abusive or insinuating missives. There is seldom allowance made for any mishap in transit or the caprice of the sitting hen, the whole being put down to the rogues of those they bought them from. From personal observation I can say that charges of this kind are unfounded in many cases, if not in the great majority. We have bought eggs at 21s. the sitting, and three chickens were the result; others, again, were all fertile, and in both cases we know that on the sellers' parts everything was as fair as it possibly could be; in fact, we never deal with those we cannot trust, and if we were afraid to buy eggs we should go in for the birds or nothing at all.

PRIZE BIRDS.—As soon as the breeding season is over, those who have a quantity of old birds on hand generally sell them off as soon as possible, and the present is a good time to purchase such, but those who wish to get prize fowls and are not well up in their “points,” should employ some one who knows them thoroughly to buy for them. This will be the means of preventing much disappointment in the way of getting very old birds for those supposed to be young, or others prominent in some good points and too deficient in others. Years ago we bought our experience in this way, as we had expensive pens recommended to us as having been invariably winners, when we afterwards found out that such could never have been the case.

PRIZE CARDS.—Some of these are of the most ordinary description, both in paper and print, but others are better, being most elegant in design and execution, and this kind always finds favour with exhibitors, especially young hands; and for this and other reasons we always think a little extra money expended in this way is not thrown away. Some go in for size of card, others for brightness of colour, but the most chaste we have ever seen or received were those from the Poultry Club show held in Cambridge in January last: we had one for a “cup” and another for first prize (£5 in all), and the delicate cream and gold colours are most pleasing. We would certainly advise all committees to get samples from Cambridge and present them to their patrons at their next shows.

PLYMOUTH ROCKS.—This is an American breed of fowl. They are rather Cochon in shape and cuckoo in colour. They have been highly praised lately for their many good qualities, but I fear they have been over-estimated in this way. They are not by any means so delicate on the table as many we could name, and they are very poor layers. Fortunately our stock of them is small, but some of our neighbours have been going in for them largely and they all speak of giving them up, as they are so long in laying as pullets, and they do not recompense for this as they become older.

CHICKENS IN THE GARDEN.—At the present time we have upwards of 100 chickens in our kitchen gardens. The mothers are cooped up here and there on the walks, and it is delightful in more ways than one to see how diligently they scour the vegetable quarters in search of snails and grubs. When they gain size they are liable to do harm by scratching, but then they can be moved on to the grass or into the woods, and a change of the kind benefits them more than anything.

MANDARIN AND CAROLINA DUCKS.—These are the prettiest of all our money ducks, and it is much to be regretted that they are so scarce. We are in want of several pens now, but cannot find them. Those who possess them would do well to advertise them in these pages. *Hemlock.*

The Flower Garden.

THE HERBACEOUS AND MIXED FLOWER GARDEN.—The late favourable weather, which has brought the soil of the mixed flower garden into such good condition for the sowing of annuals, &c., has also conduced to the appearance of innumerable weeds and other noxious intruders striving to attain a lodgment where they are not wanted, and as it is always best to take time by the forelock every effort should be exerted to exterminate them before they attain any size, and in this state nothing is more effective than a light, narrow, and sharp hoe, used when the sun is hot enough to kill the weeds as they are cut up; I say hot, because no greater mistake can be made than to set a man to do light work with a clumsy and heavy tool, for with the former he will be able to do double the amount of work in the same time, but if wet weather prevails it will be best to remove the largest of the weeds by hand, and then to loosen the whole surface amongst the permanent occupants, which will be greatly benefited thereby, and if during the operation a mixture of soot and lime can be worked in it will act as a fertiliser and keep the slugs in check. Neatness is now peculiarly looked for in this department, and therefore a good supply of flower-sticks of various lengths and strength should be kept at hand and applied in time to those sorts which we know will require support; for when done in time the plants themselves will help to hide the sticks, and thus avoid the bundled-up appearance which it is the object of good management to avoid, but is a sure result if the plants are left too long without support.

SPRING BEDDING PLANTS REMOVAL.—With such an early season many of the early spring occupants of the beds intended for summer and autumn display will now be ready for removal, commencing with the bulbous plants, such as Hyacinths, Tulips, Crocus, Scilla, and the like. These should be carefully lifted, with tops and roots preserved entire and laid in drills drawn across a warm south border, about 5 inches deep; the drills should be filled with sand, and the whole left undisturbed until both roots and tops have thoroughly decayed and the bulbs ripened. The Pansies and all other spring flowers necessary to be pre-erected should be carefully lifted and transferred to the reserve garden. The best plants of *Myosotis dissitiflora*, which being of such early culture should be largely distributed, not only in beds, but in small patches, should be selected in sufficient quantity, and denuded of all but about an inch of the tops, and laid carefully in drills drawn in the reserve garden, with the tops just above the surface; these in the autumn will divide into innumerable rooted slips, so that a square of about 8 or 9 yards will suffice to supply a very large garden.

PREPARATION OF THE BEDS FOR SUMMER PLANTING.—Those beds which do not lie fallow during the winter, but are kept at work most of the year by an extended system of spring gardening, become naturally much exhausted, and the work of preparation must include the addition of a certain amount of new compost or fertilising matter more or less according to the requirements of the plants made use of. Strong growers, such as *Ricinus*, *Wigandia*, and the like, whose chief beauty consists in size of foliage, as well as *Dahlia*, *Hollyhocks*, *Sunflowers*, &c., should have liberal additions of rich manure incorporated with the soil; but the generality of summer bedders, whose value is estimated by the amount of flowers they produce, should not be fed with very stimulating matter; on the contrary, a compost, partaking more of the nature of new soil will be found to suit them best, and contribute to a healthy development of both foliage and flowers.

ROSE GARDEN.—The plants should now be frequently and closely examined for the detection of the active little caterpillar, which is so destructive to the young buds; their presence is indicated by bunches of leaves rolled up together with a fine webwork, in the midst of which the young larva encloses itself, and eats out the heart of the flower-buds. A quick way of disposing of them is to pinch with finger and thumb every rolled-up bunch of leaves; but this practice, besides almost certainly leaving a portion

unpinched, very frequently bruises the young leaves, and renders them unsightly when expanded. A better plan, where time can be spared, is to unroll the bunches and catch the depreator. Should the weather become parching, the plants should have a liberal supply of water, with occasional liberal doses of liquid manure. If aphides appear, a gill of Fir-tree Oil Insecticide, mixed with 3 gallons of water, is an excellent application to keep them in check. *John Cox, Kellog.*

The Pine Stove.

ENCOURAGE fruiting plants to swell off their fruits by keeping the houses in a genial humid state. If adequate appliances are not available in the shape of steaming troughs to keep the atmosphere sufficiently moist, a few portable zinc troughs made to fit over the pipes are valuable auxiliaries, and are easily procured. The troughs should be filled two or three times a day, and not be allowed to become dry through the night. Nothing is more injurious than arid temperatures, especially when the solar heat is powerful, and when there is hard firing this should be guarded against under all circumstances. Syringe the walls and damp the paths three or four times during the twenty-four hours. Where plenty of troughs are at command much time is saved in damping. Close the fruiting houses early. A gentle dewing of the plants overhead at closing time accelerates the swelling of the fruit, and keeps the plants in a green, healthy, vigorous state. As the sun's rays are getting powerful under glass do not neglect shading. Do not syringe the plants until the houses are closed, and when water is standing in the axils of the leaves syringing should be discontinued until the water has dried up. The many small aerial roots at the base of the stems are kept healthy and active, as they greatly assist in feeding the plants. Succession plants may be syringed more freely overhead, as their leaf-axils are not so large, and the accumulation of water round their stems is not so great; but even then the water should not be allowed to remain too long. Those plants that showed fruit in October and November will be colouring in stages, and the early lot of Queens will soon come to the same stage; these may be removed when ripe to a cool house or fruit room, to make way for succession plants. This batch may be pushed on, if not so far advanced, by rising to 90° after closing, and may stand at 75° at 10 P.M., but in the present state of the weather this should fall 5° or even 10° during cold nights by morning. Give more room to succession plants, and when moving let the object be to place them in their permanent places the second shift after they are put into fruiting pots. It is a great mistake to keep moving large plants, and this more especially applies to plants that are fruiting; it twists their stems and checks the fruit from properly swelling. The succession batch should be put into their fruiting pots this month; this lot will succeed the autumn fruiting plants and fill up all available empty spaces. Nothing is gained at any time by overcrowding. It is also very desirable that the plants when put into their permanent places should be arranged in sections, when they can be attended to according to their requirements. For instance, as Queens are grown in smaller pots, they require extra watering, and as they are so prolific in producing suckers these have to be thinned out, or the suckers take the strength from the fruit. If large fruits are wanted all should be taken out, either by twisting them out, which is decidedly the best way, or in case the beds are broad and are not come-at-able for this operation a pair of long-handled iron pinners with a broad mouth is the best for screwing them out. When taking out the suckers no portion of the old sucker ought to be left, or the next progeny will increase in number. When gills appear at the base of the fruit these should be carefully pruned off by a knife, as sometimes the best varieties will freak in this way. *D. Wilson, Castle Hill, Devon.*

Grapes and Vineries.

THE earliest Grapes will now be ripe, and must have the fire-heat steadily reduced; let the laterals run, if there are any bare places on the trellis; admit air freely on back and front ventilators on bright days, giving only a little on the back when it is wet and sunless. Give the border inside sufficient water to

keep the berries plump, and if not already done, take off the shutters and old fermenting material from outside borders; leave only a few inches to prevent the summer drought penetrating, and if the border is dry, water with tepid water. Succession-houses of Hamburgs that are commencing to colour must be treated as recommended in previous Calendars; those that are swelling their fruit must have liberal supplies of tepid manure water and a brisk temperature. Admit air early in the morning, and close early in the afternoon, and let the heat gradually decline until the thermometer stands at 65° to 68° at 6 o'clock in the morning, then turn on a little extra heat if the days are dull, but if bright, the sun-heat is generally sufficient through the day until they commence to colour. Keep the latest house cool as long as possible, as there will be plenty of time to ripen them this year; but the house is better closed with a very little fire-heat on dull days, some time before they are in bloom. Early Muscats keep in a night temperature of 70°, with a rise of 10° by day, giving them liberal supplies of tepid manure-water at the roots. Of course the supply must be regulated to the nature of the soil and the way the borders are drained, for stagnant water at the roots is fatal to the well-being of Vines; our latest Muscats are now set, and it has been very sunless during that period, but it has been very sunless during that period, but it has been set well in a night temperature of 70° with a rise of 10° by day, the evaporating pans were kept dry, and a good number of the surplus bunches taken off as soon as the best were discernible; on a few of the coldest days, damping down was not done, and only very little air admitted; on bright days when air could be put on more freely the house was well damped once in the morning and at closing time, letting the thermometer rise to 90° after closing with sun-heat. Late varieties of Grapes, if they are to keep well, must be assisted with fire-heat. Keep them at a night temperature of 65° to 70°, with a rise of 10° by day. Pot Vines with ripe fruit still hanging must have plenty of clear water at the roots; those that are started for a late crop can be kept in a brisk temperature like established Vines, and after the fruit is thinned have liberal supplies of tepid manure-water. Vine eyes for next year's fruiting must be kept in a brisk moist heat, to make an early growth. *Joshua Atkins, Locking Gardens, Wantage.*

The Hardy Fruit Garden.

THE rather unsettled weather of the last fortnight will in many cases have prevented as fast a use of the garden engine or syringe on fruit walls as would be desirable for the dislodgment of insects, which seem to increase most during those chilly nights when it is scarcely prudent to run any risk of leaving the walls wet. As the weather becomes more settled, every effort must be used to make up for any headway the aphides may have obtained by repeated drenchings of tepid water, with or without the addition of an insecticide, as the state of the trees may indicate. Apricots will now require to have their rapidly advancing growth attended to. Young trees especially will require immediate disbanding; if the whole of the shoots that are not required to form the frame of the tree may be at once removed, taking care not to leave a crowd of unnecessary branches and spurs that are not required in the earlier stages of the tree's development. If any strong shoots were allowed to remain at nearly their full length, and new promise to again start strongly, and to monopolise an undue share of the energies of the tree, see that they are promptly checked by pinching, or by breaking out a less vigorous description. Established trees must now also be attended to, and a great proportion of the growths removed. Secure, in the first place, a sufficiency of shoots for extension, and for duly furnishing the interior of the tree with growths to take the place of those that are likely to be removed after bearing. Pinch back enough of the shoots to furnish the branches with spurs at regular distances without crowding, and break out entirely such as are not required. The outer portions of old and projecting growths that are carrying no fruits may have their wood to be formed for which there is neither use nor room, and which entails an amount of after-attention with the knife that is neither economical of the time of the cultivator nor of the resources of the tree, and is one of the surest preparations for an outbreak of

gum. Let all removed growths be carefully collected and destroyed to prevent the escape of the maggot that infest the growing points, and use every endeavour to destroy by pinching all those that remain amongst the leaves of the shoots which are retained. The thinnings of the fruits which have set very thickly this season must be proceeded with at once, and may be confined in the first instance to the removal of all but the finest and best placed one of each cluster, leaving the thinning-off of individuals until the second time of going over the trees some days later. As soon as the trees have been gone over apply water with sufficient force to dislodge any insects that may have escaped removal during disbanding, but which will probably be at least disturbed from their quarters, and will at this time be more easily assailed. Remove all suckers as they appear, and keep the alleys in front of the walls hoed over to prevent rapid drying and cracking during spells of bright weather. Peaches and Nectarines have set very thickly, but as yet make little progress, having been checked by the low night temperatures experienced during the middle of April. A commencement can now be made with the removal of some of the crowding shoots, especially upon the strongest and most forward branches, but it is not always advisable to push on too rapidly with the general disbanding until free growth, favoured by genial weather, gives promise of keeping the trees so active as not to feel any such check as occasionally results from a too free removal of the young foliage, practised at an early date, and followed by a relapse of cold and unfavourable weather. As Plums, Cherries, and other fruits are set, let them be thoroughly washed with the garden engine; or with the superior force of water from the hose where such a supply is available; as the colder water is not likely to injure those hardier subjects. Prepare ground as time is available for the reception of Strawberry plants that have been forced; working in some rich short manure near to the surface, and if on ground previously trenched it will be so much the better. *Ralph Crossling, Castle Garden, St. Fagan's.*

The Orangery.

ORANGE TREES IN POTS.—Sufficient cultural directions were given on p. 435 as to temperature, syringing, watering, &c. The fruit intended to be ripe in the autumn will now be considerably advanced in its growth; and in order that it may be of large size and good quality the trees should be liberally supplied with water, and if they have not been reported within twelve months it would be desirable to place a handful or two of rich compost on the surface of the soil. There is not much demand for Orange trees to grow for desert purposes, and in only a few nurseries are the trees to be obtained in good condition. It ought, therefore, to be well known that they are easily propagated by grafting. This operation may well be performed in March and April, and the best stock is the Lemon. The trees should be placed in a forcing house where the temperature is about 55° or 60° at night, and they should be kept in a rather close moist atmosphere until the scions start to grow. *F. Douglas.*

The Kitchen Garden.

SEAKALE.—The merits of this estimable vegetable, when dressed in a blanched state, are so well known and appreciated as to need no comment; but its usefulness and excellence in a green or natural condition of growth is not, in my opinion, so generally recognised or considered as it should be; for this reason I draw the attention of those interested in the matter at this period, when its condition is such as to fit it for a trial by which its merits can be fairly estimated. For several seasons past I have been accustomed to use it in this way, and find its quality all that can be desired, and invaluable during seasons when Broccoli has been killed entirely, and other winter greens materially damaged by frost. Under the modern method, by which individual roots and crowns are prepared for forcing requirements, many more roots of this subject are grown than formerly, and generally speaking a superabundant supply of these roots is provided, so that a surplus quantity usually remains in the ground undisturbed to make a natural growth and come in for the same purpose another season. These plants invariably throw up flower-stems, which is the part to which my notice refers, as affording a delicious dish, which unquestionably, in too many instances, after they are cut off, are not even thrown away, but only fit for the refuse-bowl. It is not, however, until I have seen 6 or 7 bushy plants in a garden, which should be removed, as they are not only a waste of space, but also a source of trouble. *W. Younge, Abbot.* [We endorse all that Mr. Mues has said as to the quality of the green Seakale when cooked. Ed.]

MELONS are now only second to Grapes in popularity and value as a dessert fruit. Since home-grown Pines have virtually disappeared from our tables, some would give to the Melon the first rank among dessert fruit; but well-grown Grapes still deserve, and it is to be hoped may always enjoy, the first place of honour on our tables. Foreign Melons are, as a rule, so inferior to English grown that they hardly compete with them. How long this state of things may continue, it is impossible to say. Nearly all foreign Melons at present seem of one type, and most of them are cut in far too green a state to permit of their developing into lusciousness afterwards. Possibly, were more of our choice strains cultivated in the South of France, Italy, and Spain, and they were cut in the more mature state, which rapid modes of transit now render practicable, foreign Melons might approach nearer to the high standard of excellence of those grown at home. Something might even be done to improve the Barcelona or green Spanish Melons by exposing them to high temperatures and dry atmospheres; though Melons cut so immature as most of these are cannot possibly ripen perfectly afterwards.

In nothing is the contrast between the Parisian markets and fruiterers and our own more essentially different than in the matter of Melons. Passing through the Centre Avenue of Covent Garden in the season, the one sight and smell is the Melon. It is the same in degree with all our provincial markets and large shops. The rich aroma of the Melon travels far and wide, and gives an aromatic dash of lusciousness to the very air. But you pass through the Halles Centrale or any of the great markets in Paris and smell never a Melon. The huge rock or water Melons, when any are present, are piled up like veritable Gourds or Marrows, and seem about as sweet and aromatic, neither more nor less. It is seldom one sees, not often one tastes, a luscious Melon on the Continent. First-class Melons seem a British institution, of which practical horticulturists have good reason to be proud. Even the multiplication of varieties, which may concern us here, affords additional evidence of the high excellence we have attained in Melon growing. For if of the naming of Melons there seems to be no end, yet the very names create an *esprit de corps* which favours careful selection and high cultivation. As so many names stand high in special branches of horticulture, such as Melon growing, for example, a variety named in their honour with their sanction is presumably a test of merit and proof of excellence. The multitude of names also reveals the fierceness of the contest in pursuit of excellence. Hardly is a first-class Melon sent out than some one improves upon it; then the improved is further improved, rechristened, redistributed.

And after all this multiplication of varieties—none of which shall we advertise by naming here—affords but scant proof of the enormous extension of Melon culture within the last few years. Until quite recently a few frames or dung pits were all that were allotted to Melons in many first-class gardens. No doubt good Melons were and are grown in such structures. They were, however, ripened under difficulties. During the early stages of the growth of Melons the moist heat for the roots provided by such

structures and the damp air were highly favourable to the rapid growth of the plants and swelling of the fruit. But the tug of war comes with the attempt to finish the fruit of the highest flavour. Who shall say how Melons were wrecked within sight of table, as it were, by the plants fogging off at the collars, the fruit splitting, or the flesh being converted into purid water during the attempt to finish them under such conditions.

But Melon culture took a new departure, and higher and safer ground, with the advent of glasshouses devoted to their culture. These as light as the lightest style of horticultural buildings can make them, with ample provision for rapidly reducing any excess of heat, and bottom and surface heat under as perfect and easy control as the winding up of a watch, brought perfect Melons within the reach of ordinary care and skill.

Some profess to make a great point of the source of their bottom-heat. There is this difference in favour of that derived from fermenting material—it is feeding as well as warming. But then the food supplies are beyond our reach of measurement and regulation. Carbonic acid gas, or ammonia, may be in excess or they may not reach the roots at all. The plants may be gorged or starved, and the cultivator be supremely ignorant of either. It seems therefore preferable to apply our heat pure—unmixed, that is, with food. It is easy to give the latter when heated and to deal it out as the plants and the crop may seem to need it. On the simple grounds of placing food supplies as well as heat under the sole control of the cultivator, we hold that heating by hot water is the most perfect for Melons as for most other plants. Further it is more indispensable for Melons than any other plant. For not only is the power of giving or withholding food more needful for this than most crops through all their critical stages, such as setting a crop, &c., but it is essential to the highest finish. Only allow the roots of Melons to feed at their own sweet will among fermenting material and a perfect set becomes doubtful, and the highest flavour at the finish impossible.

A command of a temperature of 50° top and bottom under all conditions of the external atmosphere, and this heat produced by hot water, may be looked upon as the first step to perfect Melon growing. Although the above temperature may not be always necessary, it is well to have it ever within reach. A high temperature also suits Melons from first to last, and especially at the finish. In Melon as well as Cucumber growing it is the pace that develops strength and elaborates quality, though the former requires more change of treatment than the latter.

Next to heat, Melons require food. During all their early stages they find all they want in sand, loam, and water. Melons will grow in almost any soil; they grow enormously in leaf-mould, dung, and mixtures of either with loam. But there is growth and growth, especially in regard to Melons. What is desiderated is sturdy growth from the first, and this is best obtained by sowing the seeds and growing the plants in pure loam; if it can be had of a holding character, and full of fibre, all the better. If a choice lies between very sandy loam and one approaching to clay, choose the latter, and add a little sand or crushed charcoal.

Melons are mostly sown in pots or pans, rather thickly, and potted off singly as soon as they show a "thread" or "rough," that is, their first proper leaf. The practice involves a loss of time as well as forces. It is better to sow each seed singly in a small pot. By this simple plan every root is preserved from the first, and the plant starts with vigour and consequently with a sounder collar. The importance of

the latter will be appreciated by Melon growers. The practice of potting off mature plants from seed pots or pans and burying the stems up to the seed leaves or cotyledons, is largely responsible for the breaking down of the Melons at the collar at or before the finish of the crop. The plants should never be allowed to become matted, but shifted on into 2, 3, or 4-inch pots as they require it. It is not desirable, as a rule, to exceed this size till the Melons are planted out.

For growth in houses the plants should not be stopped. The old practice, so universal, of stopping them at the first or second rough leaf, was all very well for pit or frame culture; it makes the plants break near the collar, gives the four or six shoots wanted to furnish the space an equal start. But in raising Melons for house culture the single shoot should be allowed to run till it reaches well up the trellis before it is stopped; the plants will then break with double or triple power, and produce sufficient shoots to furnish the trellis. The extension system is of doubtful utility in Melon culture, and it is far more profitable as a rule to plant rather thickly, so as to ensure from four to six fine Melons on a plant, than to aspire at cutting a dozen from one larger one.

After stopping, the next most important step in Melon culture is the setting of a crop of fruit. These are produced in the laterals. The object after stopping is, therefore, to obtain from four to six of them of as nearly equal age and strength as possible. If such can be obtained they will all open their female flowers simultaneously as near as may be: this is a vital matter in Melon growing.

The flowers should be artificially impregnated on the same day, and at the same hour if possible. Care should be taken in this matter, for perfect impregnation seems not only essential to the true and rapid swelling of the fruit, but likewise to its perfect finish. The testimony of experience is well high uniform on this point—that, as a general rule, the more perfect the seed of Melons the higher their flavour.

A few more flowers should be set than are wanted, as very often one or more of them refuse to swell. In such cases those should be cut off, and a fresh selection of flowers made. If the advanced fruit can, however, be removed in time, those that lagged behind may at times start, and in this way a crop be secured; but one or two fruits starting ahead of others will draw the supplies from the other fruits, which will quickly wither up in consequence. Some have thought, and DARWIN favoured that opinion, that the weight of the fruit swelling was in part or wholly the cause of the staving of those that were stationary; but no shading of such fruits, so as to withdraw all weight from their stems, has sufficed to send a supply of sap into the smaller fruit; besides, the same provoking symptoms were as common in growing Melons on dung beds as in houses. The great thing is to start the number of Melons desired on each plant abreast. This once done, there is but little fear of any of them dropping out of the running afterwards. Beyond this point Melon culture is simple. Each lateral should be stopped one or two leaves ahead of the fruit, and as many fine leaves left on the plants as can be sufficiently exposed to light and air.

From 6 inches to a foot in depth of good loam will grow the Melons through all their preliminary stages. As the fruit acquires size and weight, a top-dressing of a few inches of loam may prove useful. A little dung is sometimes given at this stage, but pure loam is safer. It can hardly be made too firm, and the collars of the plants should have been raised on hills sufficiently high at the first to prevent any such dressings reaching them.

The Melons will require liberal supplies of water when in full growth, and during the

FIG. 94.—CORYANTHUS MACRANTHA.

The central flower has its back turned to the spectator. For references see p. 537.

middle periods of swelling manure-water once a week is useful. Overhead sprinkling or damping down and early closing also hastens the swelling of the fruit. The moment the Melons begin to change colour or show a tendency of cracking round the part of the stalks that abuts against the fruit a drier regimen should be

adopted. The Melons, however, must not be allowed to lose their leaves till the fruit is ripe, or the flavour will be lowered. So soon as the Melons give out a suitable aroma the fruit should be cut, and finished in a dry room or hothouse. If the latter, however, the fruit must not be exposed to the sun, or it may be

scorched, or even short of that have its flavour much impaired.

Some take a second crop from the same plants. If clean and healthy this is good practice, and it is a singular fact that old plants swell and ripen their crops more rapidly than young ones; but the semi-arid atmosphere that

helps to put the highest flavour into Melons mostly brings swarms of red-spider with it, which undermine the health and cripple the strength of the plants. But by growing Melons rapidly, and having succession plants ready to succeed the others, it is practicable to grow three or even four crops of Melons in the same house within the year, and it is doubtful if any other fruit crop would yield the same amount of pleasure or profit.

— THE PELARGONIUM SOCIETY will stand all alone in the exhibition of June 27, there being no Rose show on that date to help it out; the more need, therefore, that the cultivators of the Pelargonium should in good time consider to what extent they may be enabled to sustain the Society in its isolation. As the exhibitions have grown from year to year, we may hope to see farther growth, to the credit of all concerned and the advantage of the organisation. There are in the schedule two classes that at the present time have some scientific and very much local interest—we allude to the prizes offered for hybrids of Geranium pratense, G. sanguineum, and Pelargonium oblongatum. Should the invitation of the schedule in respect of these be responded to, how attractive will be the exhibition of this year!

— FERTILISATION OF HOYA.—We are informed by Mr. R. MCLACHLAN that the name of the fly exhibited with pollinia attached to its feet by Mr. W. G. SMITH, at the last meeting of the Scientific Committee, is *Homalomyia caucularis*, L. (one of the Anthomyiidae), the same that dances over one's head when lying in bed of a morning. The larva lives in excrement, especially human.

— HEMANTHUS SANGUINEUS.—This noble Lily-like plant is now in flower in the Exeter nursery, at the base of a wall, where it appears to be in the most vigorous health, and altogether of a distinct type from any other hardy plant coming into flower in the spring months. In the distance the large flower-truss resembles the well-known *Kochea falcata*; but there is this difference, that the flower-truss is surrounded by a ring of bronze-coloured leaves altogether distinct in colour from the rest of the foliage, which gives the plant a peculiar appearance. The leaves of the plant are not unlike those of the *Hemerocallis*, but are more rigid and larger.

— BENTHAM AND HOOKER'S "GENERA PLANTARUM."—We understand that a portion of the manuscript of the third and last volume of this valuable work is already in the hands of the printer; and it is expected that the whole volume will be carried through the press in the course of the current year.

— THE BOTANIC GARDEN OF SANTIAGO, CHILE.—Under the title of "The Early History of the Botanic Garden of Santiago," Dr. PHILIPPI describes in REGEL'S *Gartenflora* a state of things that would be amusing, were it not deplorable and of ill augury for the future of the country. Nearly thirty years ago Dr. PHILIPPI was appointed Professor of Botany at the University of Santiago, and one of the duties assigned to him was the direction of a botanic garden to be founded in the *quinta normal* or model farm of the Agricultural Society. In spite of decrees, grants of money, and all the pressure an active man like Dr. PHILIPPI could bring to bear, the garden is still an unrealised project; for, although a real start was made in 1879, the director had only got possession of a portion of the ground that had been allotted and decreed for the purpose. Dr. PHILIPPI's only hope—writing towards the end of last year—was, that the new President of the Republic would compel the Society to give up the ground. Acting under instructions, Dr. PHILIPPI more than once purchased large collections of seeds in Europe, and on each occasion the seeds were not sown owing to some absurd difficulties put in the way by members of the Board of Administration. On one occasion the boxes were not even opened for two years after their arrival.

— ANOTHER NEW INCARVILLEA.—The exploration of Central Asia has led to the discovery of many interesting hardy plants, not the least interesting of which are the new species of the herbaceous Bignoniacous genus, *Incarvillea*. One of these, *I. Koopmannii*, was recently figured in the *Botanical*

Magazine, plate 6593; another, *I. Olge*, was figured in REGEL'S *Gartenflora*, plate 1001, or possibly these two plates represent the same species, in which case the latter name has priority. The *Gartenflora*, plate 1068, now gives a coloured figure of *I. compacta*, MANIMONICZ, a most lovely plant, far surpassing anything of this affinity hitherto published. The celebrated traveller, PRZEWALSKI, discovered it in the province of Kansu, North-west China, on the northern declivity of the Tibetan Alps, at an elevation of 8000 feet above the sea, whence he sent seeds to the Petersburg Botanic Garden. Fortunately, the seeds grew, and this remarkable novelty seems to have got a firm footing in the gardens of Europe. Yet, from a peculiarity in its life-history, it might have been lost ere it had flowered under cultivation. Dr. REGEL states that when the seeds germinate only the cotyledons, or at most one pair of leaves besides, unfold, and these soon die off, leaving a small tuberous rootstock behind, which grows again and perhaps flowers the next year. In foliage and habit *Incarvillea compacta* reminds one of some species of *Onolobche* before it throws up its flowering-stem. The flowering plant has a tuft or rosette of pinnate leaves, in the centre of which is a cluster of trumpet-shaped flowers of a warm rose-red, slightly suffused with purple, passing into yellow in the lower part of the outside of the tube. Dr. REGEL designates this plant as one of the most striking and remarkable novelties of recent times. Messrs. HAAGE & SCHMIDT have the stock, except a small portion retained for distribution to some of the botanical gardens.

— CASSIOPE FASTIGIATA.—At the time when LOUDON'S *Encyclopedia of Trees and Shrubs* was published this lovely little shrub had not been introduced to British gardens, and it is still far from common. There are, however, few more interesting or graceful plants than the members of this genus when in flower. *C. fastigiata* is an erect growing species with twiggy branches (not unlike some *Lycopods* in general appearance) bearing pendulous snowy-white Lily of the Valley-like bells on slender stalks. In that charmingly written book of travel and adventure, the *Himalayan Journals*, Sir JOSEPH HOOKER, in describing a "Night on Mon Lepcha," (a mountain in Nepal) says, "The Himalayan Heather grew abundantly here, affording us good fuel; and thick masses of it, with moss (which latter hung in great tufts from the bushes) laid on the snow, famed my bed: my blankets had not arrived, but there was no prospect of a snowstorm." *C. tetragona*, a somewhat similar plant to *C. fastigiata* and *C. hypnoides*, both natives of arctic Europe, are in cultivation—though somewhat rare; the latter is a pigmy moss-like shrub with red tinted blossoms. *C. fastigiata* is now in flower at Kew.

— EARLY FLOWERING CLEMATIS IN POTS.—While it is difficult to name a group of plants so well adapted for culture in pots for greenhouse decoration as the charming varieties of the early flowering Clematis, Mr. C. NOBLE, of Bagshot, had at the Royal Horticultural Society and Royal Botanic Society's meetings last week, it is at the same time a matter for surprise that so few gardeners grow them in this way. One seldom sees a good Clematis in a pot except at a flower show, and then only infrequently. The fine summer flowering varieties have found their way into most gardens, large and small; and are used in various ways with great success: the spring flowering varieties win their way much more slowly and partially, though of so valuable a character. The plants shown by Mr. C. NOBLE made very pretty specimens, and they were well bloomed: the fine flowers well coloured and in all cases decidedly striking. It is not difficult to cultivate these Clematises in pots; they root strongly and grow freely: all they require is guidance and encouragement from the gardener; such as good food in the way of soil and water, and the necessary training. Perhaps it is the great wealth of spring flowering greenhouse plants that keeps the early flowering Clematis in the background; and people will sometimes expend a good deal of labour over subjects not nearly so successful in their results or satisfying in character as the Clematis. The leading varieties shown by Mr. NOBLE included some fine new forms, such as Daniel Deronda, violet-purple; Darwin, an exquisite double pale mauve variety; Princess Beatrice, a beautiful pale form; and such others as Lord Henry Lennox, fine mauve;

Albert Victor, Lady Londesborough, Elaine, pale mauve, double; Duchess of Albany, white, new; Duke of Albany, clear mauve; Amazon, purplish-mauve; Midge, Torriani, light purplish-mauve, very fine; Endymion, pale grey; King Arthur, and Lord Gifford, mauve-purple. The combination of puce and mauve, deepening almost to reddish-purple, which is in course of development in some of the newer forms raised by Mr. C. NOBLE, makes them specially attractive.

— HABERLEA RHODODENSIS.—The natural order to which this belongs (*Cytanodraceae*), though supplying our houses with a considerable number of beautiful and interesting plants, boasts of but few species hardy, or likely to prove hardy, in the climate of Britain. The subject of the present note is one of these. It is a neat little plant, much resembling in general habit the *Ranuncula pyrenaica*, but the flowers, instead of being saucer-shaped, are tubular; in colour they are pale purple, with darker spots, the throat being suffused with yellow. A figure, drawn from a plant flowering at Kew, will appear shortly in the *Botanical Magazine*.

— BUSH APPLE TREES.—We plant beds and plantations of Rhododendrons, Roses, &c., but why not of bush Apple trees? Mr. BARKON has a plantation of these at Chiswick that are exceedingly beautiful objects now they are in full bloom—quite toy trees in respect of size, but singularly attractive just now. There are eight rows of several varieties, twenty trees or so in a line; three lines of these are on the Down, and five on the Paradise stock. The leading sorts are Lord Suffield, Celine Pippin, Cox's Orange Pippin, Small's Admirable, which is of a beautiful colour on the exterior of the unexpanded bud; Scarlet Nonpareil, Braddick's Nonpareil, Yellow Ingestre, New Hawthornden, and Stone's Pippin. These little trees are clothed with blossom from base to tip; Cox's Orange Pippin, in particular, is flowering very freely indeed this season, on trees great and small; and Lord Suffield is laden with bloom also. Yellow Ingestre stands out from the rest with some distinctness in that the blossom is almost white. Such trees as these require to be grouped in beds and plantations if used as decorative agents, and it may be said of them that they supply blossoms in spring and fruit in summer and autumn. But it is not a wise course to put such trees in shrubberies, unless space can be allowed them so that the roots of the shrubs do not run out to and absorb the nutriment required for the Apples. Lines of them along a mixed border would be a pretty feature with a background of shrubbery. By the side of these bush trees, which average 2½ to 3½ feet in height, are two rows of larger ones, 5 to 6 feet in height—all Cox's Orange Pippin on the Paradise stock, all full of blossom, and charming as natural pictures. If the crops of fruit they will, it is hoped, bear by-and-by be at all in proportion to the blossom, then we may expect a rare Apple year.

— PEARS SETTING IN THE OPEN AIR.—Has it been noticed that the small-blossomed Pears are this season setting their fruit better than the larger flowered varieties? It is said that it is so, and it is a matter fruit cultivators might make observation of. Among our many varieties of Pears there are many with large and many with small blossoms. Do the small flowered varieties set better as a rule than the large flowered ones? What do fruit growers say?

— HIEROCHLOE EDOLENSIS.—At Kew this interesting grass is now in flower. It is a stronger grower than *H. borealis*, one of the rarest of our native plants. Though not so ornamental as many other grasses, it is worth growing in damp spots of the herbaceous border or rockwork. The plant is a native of New Zealand, where it is abundant in wet places throughout the islands; also common in Fuegia, Tasmania, and the Alps of South-West Australia.

— BIGNONIA CAPREOLATA VAR. ATROSANGUINEA.—In the conservatory at Kew this remarkable variety of the Cross Vine has long been one of the ornamental climbers. It differs from the type in its narrower and longer leaflets, and in its dark red purple blossoms. *B. capreolata* (type) is one of the loftiest climbers in the South United States, from Virginia and Florida, and westward to the Mississippi, where it clothes rocks and trees with its luxuriant foliage and orange-yellow flowers. It owes its name

of Cross Vine to the fact that a transverse section of a branch shows its wood arranged like a cross.

— **GYPHOPHILA CERASTIODES** is a pretty little rock plant from temperate Himalaya, where it is found at elevations of from 6000 to 12,000 feet. It forms a compact cushion of foliage studded with white red-veined flowers. Many years ago it was cultivated in this country, but until recently it seemed to have disappeared. A nice plant is now blooming in the herbaceous collection at Kew, and a figure from it has been prepared for the *Botanical Magazine*.

— **DAVALLIA ELEGANS** AS A PYRAMID.—It is too late in the day now to indicate to plant growers, or lovers of devices for training plants, how best to make a cone, or pyramid, or indeed any other form that one could mention, for in good truth the business is pretty well known to everybody. But there are certain plants with which every one is not acquainted which are of more value than others when trained, and which give an effect at once pleasing and artistic. In this category the *Davallia* above named is entitled to a place in the first rank. It will creep over the surface of a pyramid from the base to the vertex, and clothe it with fronds in a manner so natural as to elicit admiration. The fronds are borne upon stems from 6 to 9 inches long, which hang loosely from the framework in natural order, and it is altogether an object of singular beauty for a sitting-room.

— **CARTER'S EMPRESS ANEMONES**.—Messrs. JAMES CARTER & Co. send us specimens of their strain, which are robust in habit, bold in flower and foliage, varied and very rich in colour. If the talk is equal to the sample sent us, Messrs. CARTER may congratulate themselves on the possession of a very superior strain.

— **LILY OF THE VALLEY**.—Messrs. HAWKINS & BENNETT, of Twickenham, send us specimens of the greatest excellence. The foliage is large, ample, rich, shining green with a lustrous bloom, and with many flowered racemes and large flowers. The appearances are apparently due to copious supplies of nourishment applied during growth, and producing a magnificent appearance. The method of culture under which these fine plants are produced was given at p. 655, vol. xi., 1879.

— **ACACIA GRANDIS**.—Perhaps there is no other variety in this extensive and useful family of plants that is more striking when in flower than the object of this notice. An ordinary-sized plant in good health, and laden with its bright golden flowers, need only be seen once to win high opinions, and yet the variety is only met with here and there in private gardens, where it is most required. You may cut it almost to a skeleton, and yet the few shoots that remain will catch the eye, even if the plant is located in the most obscure corner of the conservatory.

— **MISLEADING ADVERTISEMENTS**.—Our attention has been called to an advertisement of Messrs. CLAY & LEVESLEY, in which they profess to give a quotation from a paragraph which appeared in our number for April 29, p. 506, but which contains the following sentence which nowhere appeared in our columns:—

"When it is stated that they were in comparatively small pots, and had not been reported for four years, the fact that CLAY'S Fertiliser was exclusively used as a manurial agent is of the greatest importance."

This statement emanates from Messrs. CLAY & LEVESLEY themselves, and we decline to be responsible for it.

— **BABIANA TUBIFLORA**.—This curious as well as pretty bulbous plant was first discovered by THUNBERG, and was afterwards sent from the Cape to Kew by MASSON more than a century ago. It is very distinct from the *Babiana* generally grown for ornament. It has a long tube with white segments, the three lower ones each bearing a central blotch of crimson. Now in flower in the Cape-house at Kew.

— **CYRTOCERAS REFLEXUM**.—This plant, which is seldom met with in private gardens, though not what one would call a brilliant plant, is nevertheless deserving of attention from those who do not grow plants alone because of their striking leaves, or from

some sudden fascination for the beauty of their flowers. It is what would be best termed an interesting plant—interesting in its habit and mode of flowering, and affording enjoyment as well as instruction to those who are disposed to notice the different transitions through which certain plants pass in their various stages of development. It resembles the *Iloya* in its mode of flowering, but has smaller and more pointed leaves.

— **BUCKINGHAM HORTICULTURAL AND FLORAL SOCIETY**.—The annual exhibition of this old Society is fixed for July 25, and among some decidedly original features in the schedule of prizes is one class for the best floral design of a Triumphant Arch, not to exceed 24 inches in height and 30 inches in width. These prizes are given by the Mayor and one of the Aldermen—perhaps anticipatory of some grand civic doings. The competition, however, is confined to cottagers. Perhaps it would have been better had the prizes been offered in open competition.

— **VERONICA HULKIANA**, now flowering beautifully in the temperate-house at Kew, was sent to that establishment nearly a score years ago, from New Zealand, by Baron F. VON MEÛLLER. It is a striking species, of somewhat woody habit, with large panicles of lavender-blue flowers. Like many of the *Veronicas* from New Zealand, this will flourish in the open border—in many places, at least—in this country, though under such conditions it of course does not flower quite so early as when grown in a cold frame or conservatory.

— **KNOWSLEY GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION**.—We are pleased to learn from the first report of this Association that the first session, although a short one, proved a decided success. Some very interesting and instructive papers appear to have been read by the members, and by the good attendance and lively discussions which have followed the reading of each paper it may safely be inferred that the Association bids fair to make an early start next session, and to present a still more favourable account of their doings next year. The following is a list of the subjects on which papers were read:—"The Potato," "The Peach and Nectarine," "The Brassica Family," "East Indian Orchids," "The Rose," "The Strawberry," "The Stephanotis and Allamanda," "The Croton and Draecana," "The Melon and Cucumber," "The Carnation," "Seeds and Seed Sowing," "The Grape Vine," "The Abutilon, Cineraria, Fuchsia, and Pelargonium;" "The Illebrebe and Chrysanthemum," "The Coniferæ Family and Ornamental Trees and Shrubs," "The Pine-apple," "Cool Orchids," "Bedding Plants and Bedding Out," "The Asparagus," and "Floral Decorations."

— **PYRETHRUM TCHIHATCHEWII**.—This hardy dwarf evergreen species, with the drawback of an unpronounceable name, is a valuable plant for covering the summits of rockwork and such places in an open and exposed position. In such a place it makes a very close and compact growth, and throws up numbers of pure white flowers on long stems. But it is not a plant for every spot. When brought into notice a few years ago it was placed in a position that encouraged it to make a very vigorous growth, which smothered the less robust plants about them, and then gardeners became dissatisfied with it. Let it be put on hot dry spots, and it will render good and effectual service.

— **THE YORK NURSERIES**.—A few of the most conspicuous alpine plants now to be seen flowering on the rockery in the nursery grounds, York, are *Artemisia echinoides*, with its large heads of golden-yellow flowers, spotted more or less with brownish-crimson, which is without doubt one of the most beautiful objects either for the decoration of the rock garden or herbaceous border. *Primula ciliata purpurea* has been much admired, though it is now past its best. Tufts of the white *Fritillaria*, its large and beautiful bell-shaped blossoms suspended over a mass of the deep blue flowers of *Gentiana acaulis*, have a really charming effect. As for the wild *Primrose* it seems to be everywhere, in every nook and crevice, blending in the most charming manner with the large, deep blue of *Myosotis dissitiflora*, which also appears to have almost unlimited sway. We noticed also a nice example of *Thlaspi rotundifolia*, growing in ordinary soil between two pieces of rock, where it looked quite at

home. *Anemone fulgens*, *Aubrietia greca superba* is good, hanging as it does from the rocks above. A little later there will be quite a display of bloom of the different species of *Edraianthus*; the following are the best:—*E. pumilio*, *E. pumiliorum*, *E. serpyllifolia*, and *E. dalmatica*. Here also may be seen quantities of that most beautiful of all our native spring flowers, *Gentiana verna*. *Gentiana bavarica* (the alpine *Gentian*) may also be seen unusually strong and vigorous, but it is a little later to flower than *G. verna*. *Menziesia empetriformis* is simply charming, in fact it would be difficult to give an adequate idea of its beauty. *Andromeda tetragona*, too, is very healthy, and will soon be covered with its pretty white Lily of the Valley-like flowers. Many others might be named, such, for instance, as the beautiful white and purple *Trilliums*, different species of *Saxifrage*, *Primulas*, *Anemones*, &c. There is also here a fine display of both alpine and show *Aucubas*; they are mostly grown in pots.

— **THE OXFORD ROSE SOCIETY** will hold its thirty-first annual exhibition in the famed "Lime Tree Walk," Trinity College Gardens, Oxford, on Thursday, July 6. The Hon. Sec. is Mr. W. GREENAWAY, Paradise Square, Oxford.

— **THE WEATHER**.—General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending May 1, issued by the Meteorological Office, London.—The weather has been very changeable, densely overcast skies with heavy showers of rain and hail alternating with frequent intervals of sunshine. Towards the latter part of the period thunderstorms occurred in many places, while snow fell in northern Ireland and at some of the central English stations. The temperature has been below the mean in all districts, the deficit varying from 3° in the North to 5° in the West. The maxima were lower than during last week, and ranged from 61° in "Ireland, S.," and 60° in "the Midland Counties," to 55° over Scotland and in "England, N.W." The minima, which were registered on various days in different parts of the kingdom, were as low as 29° in "Ireland, N.," 31° in "England, N.W.," and "Ireland, S.," and 32° to 34° elsewhere. The rainfall was about equal to the mean in "Scotland, E.," but in all other districts it has again been more than the average, the excess in England being large. Bright sunshine has been slightly more than that registered last week, the percentages ranging from 30 in "Scotland, E.," to 44 in "England, S.W." Depressions observed.—The changes in pressure have been very sudden and considerable. Some well defined and deep depressions have crossed our islands in an easterly direction, the most serious one passing over southern England on the 29th. The wind until the 27th was generally northerly and strong in Scotland; but during the remaining part of the period its direction was very variable. On the 29th a very severe south-westerly gale was felt over our southern counties, south-easterly to easterly winds and gales over northern England, and northerly gales in Ireland. As the depression passed away the wind moderated and shifted to the westward, but subsequently "lacked" again to between south and south-west on all our coasts.

— **GARDENING APPOINTMENTS**.—Mr. HUGH McLEAN, lately Gardener at Auchterarder House, has been appointed as Gardener to E. E. SCOTT, Esq., St. Catharine's, Liberton, Edinburgh; Mr. MURDOCH MACKENZIE, lately Foreman at Ballochmyle, Ayrshire, has been appointed as Gardener to T. B. LOCKINGTON, Esq., Craighalls, St. Paul's City, Kent; Mr. ROBERT ANDERSON, lately Foreman at Tarvit, Cupar Fife, has been appointed as Gardener to JOHN LAING, Esq., Granton Lodge, Aberdeen; Mr. EDWARD NICOL, from Blair Athol Gardens, has been appointed as Gardener to STEPHEN SANDERSON, Esq., The Elms, Berwick-on-Tweed; Mr. ROBERT DICKSON, lately Gardener to Miss CRAWFORD SERVICE, Cranley, Cairnairs, N.B., has been appointed as Gardener to WILLIAM ORR-EWING, Esq., Rhea Lodge, Row, Dumfriesshire; at all through the agency of Messrs. DOWDIE & LAIRD, of Edinburgh.—Mr. J. F. WILKINSON is leaving File Place, the seat of Viscount GAGE, to go into business in the fruit and cut flower trade at Bradford, and is to be succeeded as Gardener at File Place by his late Foreman, Mr. EVANS.

ORCHIDS IN BELGIUM.

A SHORT time ago I paid a visit to the Château de Bailloville, Marche, by the kind invitation of M. Massange, and I was well repaid for my journey by the grand display of Orchids I saw there. The East India-house contains a good collection of these plants, including some very fine specimens, of which I will try and enumerate a few. The *Vandas* formed the most prominent feature, and they reflect great credit on those who cultivate them. Of *Vanda suavis* there are many fine specimens, and amongst them some good varieties; also *V. tricolor*, of which there were plants from 2 to 3 feet high, and their foliage reaching down to the pot; *V. tricolor planifolia* was very conspicuous, and is one of the best of this section; and there was also *V. tricolor formosa*, and many other excellent varieties of the tricolor section. *V. Batemanii* is a noble specimen, 5 feet high, and a perfect plant. Associated with this was *V. Cathartii*, 4 feet in height, with excellent foliage—in fact, the best plant I have seen of it; also a capital plant of *Vanda cœrulea*, which had bloomed well in the autumn. *Acridies Warneri* was represented by a well-grown specimen, 3 feet in height, and in perfect health, as also was *A. Lobbi*, and many others too numerous to mention.

On the side table was a well-grown collection of *Cypripediums*, on which M. Massange prides himself, as including all the best kinds, and he intends making them an especial feature. Their foliage is mostly good, and on this account, when they are not in bloom, they form objects of attraction. Of *Cypripedium superbiens* I noted a fine specimen, and it is undoubtedly the best of the *barbatum* section; *C. caudatum* was also a fine specimen, and it is one of the most curious; *C. Lawrenceanum* was very conspicuous; *C. Stonii* seemed perfectly at home, and was showing well for bloom; *C. Lowii* was freely in flower. I also noticed suspended from the roof of this house several fine plants of the beautiful *Cattleya Dowiana*. In the *Cattleya*-house there is a grand lot of well-grown specimens in the best of health, and many of them in bloom; conspicuous among these being many good varieties of *Cattleya Trianae*. Some were pure white, while others were of a rich magenta, their lips, sepals, and petals being of various shades of colour. *C. amethystoglossa*, with very fine spikes bearing twenty-eight flowers, was decidedly one of the best plants and varieties I have seen; the sepals and petals were beautifully spotted, the same as may be seen in Mr. Warner's *Select Orchidæusæ Plants*. There are several forms of this species, and they are difficult to recognise unless one sees them in bloom. I also noticed a well cultivated specimen of *Lælia purpurata*, with very strong flower sheaths; also the rare *L. Stelzneriana*, a plant that one seldom sees; and *Cattleya Warneri*, of which there are here many fine plants, together with *C. labiata*, promising well for bloom in the autumn.

Ceoloyne Massangeana, figured in the *Gardener's Chronicle* for March 18, is represented by a large specimen which has borne nine of its long spikes of flowers, and is one of the most beautiful of the *Ceoloyne* family. There are many more plants worthy of note in this house, but time and space will not admit of my mentioning them.

In the cool Orchid-house there is a splendid display of *Ondotoglosses*, *Masdevallias*, and many other cool Orchids on either side of the house, forming a mass of flower-spikes overhanging the green foliage of the plants, and the colours being well varied a nice picture is the result. There were a good many spikes of *O. Alexandræ*, as many as 100 showing and blooming at one time; their bulbs were very fine. Among the specimens of *O. Pescatorei* there was one of the best I have seen; and good varieties of *O. roseum*, with masses of spikes of its deep rose-coloured blossoms presenting a pleasing contrast with the white *Alexandræ*; *O. Hallii*, with spikes 4 feet in length, in full beauty; *O. polyanthum* with its yellow flowers; *O. Andersonianum* had two spikes in bloom, a very good variety with enormous bulbs. The rare *O. Jenningsii* was flowering with two spikes of its white and crimson-spotted blossoms. I also noticed a very fine *O. trumphantis* of superb colour, and each individual flower 3 inches in diameter. Intermixed with the *Ondotoglosses*, the fine colours of the *Masdevallias*, such as *M. Veitchii*, *M. Harryana*, *M. Lindneri*, and others, were seen to great advantage. *Sophronites grandiflora* was in full beauty; *Oncidium macranthum* was showing well for bloom; also *Ondotoglossum bevilofium*, pushing forth two spikes of flowers—this plant blooms very freely here, but as a rule it is considered to be shy blooming. The *Epipendrum Veitchianum*, with its orange-scaled flowers, makes a splendid contrast suspended from the roof and intermixed with the other Orchids I have named. *E. S. Williams, Holloway.*

HOME CORRESPONDENCE.

African Tuberoses.—Most of those with whom I am acquainted, who have tried these Tuberoses, like several correspondents who give their experience with them, have failed. But this is evidently through their not being treated as they require. A carpenter residing in this neighbourhood, who is fond of gardening, has got a house in which he occupies his leisure hours with pleasure, and profit, in growing flowers for market. He got some of these roots early in autumn with a view to try them, and has had complete success with them. I saw them early in April, and nothing in their way could be better; the flowers were large, each stem bearing from twenty to twenty-four, the roots that failed not being more than two per hundred. They were potted in November, and at once put in a bottom-heat of from 80° to 90°; here they soon made plenty of roots, after which they were moved out of the bottom-heat, and kept much cooler, allowing them to come on slowly. In several other places, where I have seen them tried, they like these, began to grow early, and with a view to have them in bloom with as little delay as possible the growers pushed them on in a brisk heat, the flower-stems came up strong, but almost all went blind; whereas under the slow treatment, after roots had been formed, the flowering process went on in a way that left nothing to be desired. So far as I have been able to make out, there is nothing else to account for the difference in success that has attended the different individuals who have tried them. *T. Barnes.*

To Gardeners Intending to Emigrate.—Probably there are many gardeners in England who contemplate trying to better their position in another land. I hope none of them will subject themselves to the disappointment of being influenced by such advertisements as that which appeared in the *Gardener's Chronicle* of August 13, 1881, p. 222, in which Mr. Johnson, of the Metropolitan Nurseries, Rodebosch, Cape Town, generously informs gardeners that they will find it to their advantage to avail themselves of the assistance which he there asserts he is prepared to give them. This assistance, they will observe, is of no meagre kind, but such as could alone emanate from the heart of a true brother gardener, full of sympathy for his unfortunate brethren across the sea, and the proprietor of such an interesting establishment as the "Metropolitan Nurseries." Having landed in South Africa, with the view of seeking better things than I thought I could attain at home, I set out in the full assurance of not only seeing round the nurseries, but of being the happy recipient of Mr. Johnson's assistance. I arrived at Rodebosch, and had but little difficulty in finding the "Metropolitan Nurseries," and also the proprietor, to whom I briefly explained the nature of my visit. Mr. Johnson received me very kindly, and assured me that he was full up, and could do nothing for me. He had two young men in his situations. I saw the young men, and could see that Mr. Johnson was full up. I also saw the "Metropolitan Nurseries" as I stood by the office or sale-room. Unfortunately I have no descriptive power, or I might give your readers a brief sketch of them. I thanked Mr. Johnson for his kindness, and left them (the nurseries) uncharmed, and would assure any gardener that he will find it to his advantage to consider the cost before sailing for Cape Town. *William Green, Cape Town, South Africa.*

Berberis Darwinii and B. stenophylla.—In exceptionally mild winters like the one just past, *Berberis Darwinii* will not be injured anywhere, but when frosts are very severe, as in 1880 and 1881, they get sadly cut up, as was the case here, for they become so shabby that they had to be pruned considerably to get rid of the dead wood. The reason of their being so shabby is owing to the extra growth they made, as the plants are full of young shoots, and the season being favourable all these became crowded with blossoms. Where the *Berberis Darwinii* does best is in front of tall growing shrubs exposed to the sun, but sheltered from cold cutting winds—a position for which it is specially adapted, as it forms a splendid background to a herbaceous or other flower border, and looks quite at home. *B. stenophylla*, a seedling from it, is much more drooping and prostrate in its habit of growth, and forms a splendid ornament on rockwork or banks, as it arches and droops over in the most natural and pleasing manner possible. Both kinds may be readily increased by layers, and *B. Darwinii* seeds freely, and plants may therefore be quickly raised by either mode if desired. *J. Sheppard.*

The Ash and the Oak.—I have seen several allusions to the old proverb concerning the leaving of the Ash and the Oak, made in what may be called non-professional papers, and most certainly by non-professional writers, few of whom display any special knowledge on the topic of which they have written. The real point at issue, and one that might easily be decided, is this, Does the Ash ever precede the English Oak in leafing?—because, until it is shown that such a thing does at times occur, there is neither sense nor wisdom in the proverb. I must say I have never seen the Ash in advance of the Oak, let the season be what it may. The present season has been rather productive of early growth in all trees, but the Ash seems to remain generally quietest. A large Oak, never earlier than other Oaks in expanding its leaves, has had foliage for three weeks; a robust young Ash close to it has not yet burst a single bud. Both trees look stout. On a more northern aspect the Ash is a trifle earlier, but quite a fortnight behind the Oak. In this latter case the Ash is partly fed with moisture by a ditch; in the former case the soil is comparatively dry. On the other hand the latest Ash tree in this district is one growing in a low boggy meadow, close to a stream. One theory set up is, that as the Ash is a shallow rooting tree it is accelerated or retarded in its growth by moisture or drought; but assuming that such were the case, it would not unreasonably follow that if the spring were wet or dry, the summer and autumn might be the reverse. The real point of the matter is found in the "if," which in this case is to be taken in a peculiarly doubtful sense. As the Oak, in my experience, always precedes the Ash, there can be no "if" in this case, whereas "if the Ash precedes the Oak" the matter is left open to the widest range of improbabilities—a something that may but never does happen. It would be of interest to learn from various districts—especially from moist and comparatively dry ones—how the two trees behave this spring, and thus get some tangible information that may either substantiate the proverb or scotch it for ever. *A. D.*

Linum flavum and Linum arborescens.—Referring to a note of my friend, Mr. Alfred O. Walker, on p. 559, it appears that confusion still exists between *Linum flavum* and *Linum arborescens*. This is not to be wondered at, as the flowering season of the two plants is separated by some months, and it is therefore difficult to compare them. The latter known to me and commoner of the two plants, which I also raised from seed last year obtained from the same source as Mr. A. O. Walker's, is *Linum flavum*. It is well figured and described in the *Botanical Magazine*, tab. 312, where it is said to bear considerable similarity but yet to differ widely from *Linum arborescens*, the latter being a greenhouse shrub, a native of the Levant, whilst *L. flavum* is a native of Germany, a hardy herbaceous perennial, flowering in July and August, and ripening seeds out-of-doors in England. *L. arborescens* is figured and described in the *Botanical Magazine*, tab. 234, where it is said to begin to flower in the greenhouse in March, and to continue to flower more or less through summer. I recollect that thirty years ago when I used to keep it in a cold frame through winter and use it for a spring bedding plant, it would flower from April until nearly the end of June. It was introduced by Professor Silthorp in 1788, and is well figured in his *Flora Græca*. It is stated also in the *Botanical Magazine* that it produces no seeds in this country, and is with difficulty increased by cuttings. Having grown both these plants for several years, and having distributed *L. arborescens* extensively in spite of its slowness of propagation, I can confirm all that is said about them in the *Botanical Magazine*, except as regards their native countries, which I have never visited. It is probable that *L. arborescens* is hardly in mild winters in the more favoured parts of the British Islands. *C. Wolley Dod, F.R.S., Hald, Malpas, April 29.*

Spiræa confusa.—I should like to draw the attention of gardeners and others, who have to keep up a supply of white flowers during the early spring months, to this fine shrub, which is grown in nurseries under the name of *S. Van Houttei*, and which is well adapted for forcing, its lovely white flowers being produced quite freely on the previous year's growth. February is the beginning of March, by being placed in a cool Peach-house or vinery, where it will not be too much excited by strong heat. The long festoons of flowers are well adapted for making wreaths, &c.; and for planting in shrubberies I think there can be nothing prettier than when in flower in the month of June. I have sent a small spray, so that you can judge of its usefulness. *P. Island, The American, Kils.* [We can confirm your statement. *Err.*]

Tradescantia multicolor.—To say that this is infinitely superior to the older and more commonly grown *T. zebrina*, of which such large quantities are employed for decorative purposes, is to bestow upon it but a very small amount of praise, and hardly do

justice to it. As a plant suitable for an edging to baskets growing in stoves, ferneries, or conservatories, and which have occasionally to do duty for the decorating of front halls, staircases, and ball-rooms, it is unique, and has few competitors to beat it. The various colours of its foliage, some of which assume quite a brilliant and striking appearance when not shaded too much from the sun, render it a very suitable subject for intermingling with cut flowers in those small globular glass which are so extensively used for dinner-table work; it is also very effective, and is seen to advantage when planted out in narrow borders in plant-houses, or when growing in small pots with the shoots drooping over the sides of the stage. Altogether it is a most useful plant for decorating, and may be used in a variety of ways. J. H.

Alpine Auriculas.—I use these Auriculas extensively for edgings of borders, and I do not know anything more beautiful for the purpose or more suitable. They give very little trouble and afford a profusion of flowers, with unlimited varieties of colour. When the spring blossoms are over they make a quiet green edging, and do not come in competition with the other flowers; and in autumn they again produce some bloom to enliven the monotony, when a good many of the summer flowers have passed away. G. H. W., *St. Mary Church, Devon.*

The Alexander Peach.—The Alexander Peach is, I think, destined to a great future in forcing-houses; it is some years since I received it from America. I confess to having been very incredulous when I read the description given of it, but it has entirely justified the high character which accompanied the plants sent to me. I have not fruited it out-of-doors (an almost hopeless method of Peach growing), but under glass it is an admirable fruit; in a cold orchard-house it ripens a week before Early Beatrice, and is double the size. I have now in a heated orchard-house fruit ripe and ripening, the trees having been put in about the end of January. T. Francis Rivers.

Valeriana Phu-urea.—At p. 506 Valeriana Phu-urea is mentioned as being cultivated in botanic gardens. It is not confined wholly to those places, but is used in many places in the north of Yorkshire as a spring bedding plant. I have before advocated its use in your columns for that purpose, and after several years' experience I must say I do not know of another plant so telling in the spring garden. It is very hardy, and very easy of propagation. Hence, I have had four beds of the Valeriana Phu-urea, one with about 120 large plants mixed with about three times its number of bright scarlet Tulips. The beauty of this bed surpassed anything I have seen in the way of spring bedding, and I would recommend this mixture to all that grow spring flowers. The next telling bed was a large round one, with about sixty large plants of the Valeriana Phu-urea, and about twice the number of blue Hyacinths bordered with Blue King Viola. The other two were smaller round beds of Valeriana Phu-urea and red Hyacinths bordered with Cerastium tomentosum. Mixtures of this kind have a very telling effect in any garden. The Valeriana is as bright as the best yellow Calceolaria that I know. In a former volume you gave the local name of this plant in Westmoreland as Tommy Two-stabs; since then that name has become pretty well established in all parts of Yorkshire. [We are sorry for it!] William Calverley, *Thorp Perrow.*

Shrubs for Town Planting.—It is lamentable sometimes to see the poor wretched shrubs struggling for existence in towns, where the atmosphere is such that only a few kinds will succeed, and yet planters continue putting in almost everything instead of keeping to those that can withstand the dust, smogs, and smoke without showing signs of serious distress. One of the best among evergreens is the Aucuba, the leaves of which are so thick and leathery, and the surface so smooth and glossy, that dirt either does not effect a lodgment or if it does its hold is so slight that the first rain which fills washes it all off, and makes their faces smile with bright looks. Aucubas are so hardy, too, that neither wind nor frost affects them, and as to their ornamental appearance they are quite unrivalled, especially when clothed with their coral-red berries. To get them to bear these freely it is only necessary to plant one of the male kinds near by, the pollen from which will fertilise several, and to make sure of this it is worth while to do it by hand, as then a good crop may be always secured. Eucyonius, though not so hardy and trusty as Aucubas, are capital town plants, and more particularly for small forecourt gardens, as they form neat compact bushes, and may easily be kept in that state for years. Some of the gold and silver-leaved sorts are remarkably handsome, but unfortunately they are more tender than the green varieties, which not only bear the winter best, but also the heat and smoke. In the north of London, about Canonbury and Highbury, I have seen these equal to any in the country, and I have also been much struck by the fine tropical

appearance of the old Sumach, which along by the course of the New River keeps in luxuriant health. A plant with such foliage as this has is well adapted for positions near buildings, as its character is such that it does not look stiff or formal anywhere; and as it is so enduring and so handsome the wonder is that it is not made use of much more than it is. Another greatly neglected plant is the Fig, which stands a town atmosphere well, and besides its noble foliage there is the fruit to look forward to, which trees of it bear freely in hot, enclosed places. The soil which suits the Fig best is that which is poor, light and dry, as with its roots in a restricted layer the growth it makes is more solid, and therefore less liable to injury from frost. The large-leaved kinds of Box, such as latifolia, myrtifolia, and others, are valuable for town planting, as they can hold their own almost anywhere and always look well. Hollies succeed fairly where there is not much smoke, but a town atmosphere affects the variegated kinds unfavourably, and in it they invariably have a shabby look and make an indifferent growth. The large-leaved Privets are always satisfactory, and among deciduous shrubs the Lilac is one of the best, but it is generally badly managed as regards pruning, the shoots being simply cropped and shortened, instead of thoroughly thinned out, to give the young ones breathing room, and plenty of light and air to allow them to ripen. J. S.

A Fruit Within a Fruit.—I am investigating the botany of Indian Mustards, seeds having been obtained from every district in these Provinces. They

FIG. 95.—FRUIT WITHIN A FRUIT.

were sown in plots in this garden. Amongst them was a variety with pods as in enclosed drawing (fig. 95), and as it seems to correspond so nearly with an example described as "a fruit within a fruit" in a recent number of the *Gardeners' Chronicle* (January 7) I thought it would be as well to record it. All the pods of this variety appear to be similarly affected more or less. Whilst examining some of them I noticed that the inner abortive pod was open at the apex, as in the carpels of Reseda; usually, however, it is closed, terminated by a well-formed beak. J. F. Duthie, *Saharunpur, N.-W. Prov.* [Many similar instances are on record; see *Vegetable Teratology*, p. 181, and if we are not mistaken Griffith somewhere describes a similar form. Ed.]

How to Start a Rookery.—An inquirer asks, at p. 519, for information on the formation of a rookery. I have, by the following method, succeeded in starting two rookeries, one at Taplow Court, Bucks, which is now a very large one, the other at Glenapp, Ayrshire. The artificial nests were placed in the trees early in February; the rooks took possession of them very quickly, laying in them, and constructing more themselves in a few days. Collect a number of small hard-wood sticks, of the size the rooks use, such as Elm, Beech, about a foot or so long, make them into a bundle 1 foot in diameter; this quantity, with those you must break off in the locality of the nest to make a clear open space around, as the rooks themselves do, will be sufficient for one nest. Let a young man tie this to his back and climb up into the tree chosen, into the very top, far as he can safely go, and select a three-forked upright shoot, then commence to form the artificial nest by making a firm foundation in the fork with the sticks 4 or 5 inches thick, then work it round in the form of a bowl

9 inches by 12, and about 10 inches high. The inside should be made smooth and regular, the outside rough, as like the natural nests as can be, and make from four to six nests in one tree. The ultimate success of the undertaking chiefly consists in placing the nests in a branch which sways well with the wind, the nests being made neatly, which makes them more attractive to a young colony. As the rook is a very indiscriminate bird it will take fully an hour when up in the tree to make one nest properly. Also take up a little dry roughish grass in your pocket to line the inside of the nest with. [And take care lest you fall.] James Buckland, *Burnham, Bucks.*

Gentiana acaulis at Killiercranke, Perthshire.—I had the pleasure to see this beautiful spring plant a few days ago in perfection at Killiercranke. It is growing in friable sandstone, but does not make such a robust growth as I have seen elsewhere. Still it flowers very profusely, and is used as an edging to the walks in a garden near the Pass. When I saw it it was a perfect sheet of blue. I mention it in consequence of the roots having been forced down a quantity of the brickwork, and to my great surprise, in tracing the roots to their extremities, I found on one side that the leading root had run to the great length of 42 feet, and on the other side to about 15 feet immediately under the top course of bricks. To me this seems remarkable, and should any readers feel a curiosity to see it, I should be happy to show it to them. W. G. Turner, *The Rookery, Strathcan Common, Day 2.*

Remarkable Growth of a Silver Birch.—When I came here, twenty-nine years ago, I found a Silver Birch growing on the top of one of the garden walls, 9 feet from the ground, apparently many years old. During that time I never knew it in the least degree affected by the hottest season, as it held its foliage quite as well as perfect sheets of blue. I removed it in consequence of the roots having forced down a quantity of the brickwork, and to my great surprise, in tracing the roots to their extremities, I found on one side that the leading root had run to the great length of 42 feet, and on the other side to about 15 feet immediately under the top course of bricks. To me this seems remarkable, and should any readers feel a curiosity to see it, I should be happy to show it to them. W. G. Turner, *The Rookery, Strathcan Common, Day 2.*

Rhododendron eximium.—Mr. Llewellyn in his very interesting paper on Rhododendrons in your last number asks "What is R. eximium?" He will find, by referring to Hook. *Kew Journ.* v. (1853), that it is a plant introduced by Booth from Bontan, and named by Nuttall. Both it and R. venosum are now, by the highest authority, considered as varieties of R. Falconeri. I have specimens, and have seen others in several collections. Mention is made of R. eximium in *Cartwright's* v. 1879, p. 227. This plant eximium is of the interesting and suggestive fact that so many species of Sikkim Rhododendrons reappear—with a difference—in Bontan: R. Hookeri for R. Thomsoni, R. grande and longifolium for R. argenteum, R. Griffithianum for R. Aucklandii, and so on. We have much yet to learn of the varieties, if not new species, in both the above countries, as well as in the adjoining districts. J. H. Mangles, *Vallevoil, Batavia.*

The Weather and the Fruit Crops.—Since penning the favourable report of the fruit crop weather has changed for the worse, and I fear the hopes then formed will, in a great measure, be blighted, as to-night (April 29) we have a cruel, tearing wind blowing, which for violence has not been equalled since the country was visited by the heavy gale of October last year, when trees were smashed and uprooted to a most distressing degree. The injury it will do to fruit trees must be great, as they are being lashed in such a way that every leaf on the exposed side will be either bruised or torn to pieces, and the blossoms and much of the fruit now set must share the same fate. Truly the seasons are disheartening, for if we escape frosts we get wind, which is even more devastating and destructive, as nothing can stand against it. J. Sheppard, *Woolverstone Park.*

Schizostylis coccinea.—Some fourteen or fifteen years ago this brilliant Itidaceous plant was introduced from Kaffraria, and created quite a sensation, but as it is not generally known that it is hardy, it has not been so extensively cultivated as it would otherwise be. As it flowers late it is necessary to plant it in a sheltered position, not so much for the sake of the plants as the protection of the blossoms, which in the autumn are apt to get knocked about by the wind or damaged by a continuance of wet. To prevent this, the plants should be grown together in a border under a wall or fence, where they can have the desired shelter, and, if necessary, be covered temporarily with any old spare lights when the plants come into bloom. Managed in this way they yield a long succession of flowers, which are most valuable for cutting, as they are not only exceedingly brilliant, but last a long time in water. Although the height and growth of the plants greatly resemble the common Iris, the flowers are more like those of the Gladioli, and are borne in the same way on short slender spikes, which dress

well in a vase. Besides being of great value for affording cut blooms, *Scythostylis coccinea* is of equal service for pots, as in a greenhouse plants of it make a fine show, and blossoms in the winter through. The way they may be grown with the least trouble is to plant them out in a prepared piece of ground made rich and light with manure and leaf-mould, and at the end of September the plants should be lifted and carefully potted, and when watered kept close in a frame. Here, by enjoying the extra warmth and moisture, they soon emit fresh roots and quickly become re-established. If cultivated in pots during the summer, liquid manure should be given, and the pots plunged in some non-conducting material to keep them shaded and cool. *J. S.*

Late-keeping Potatoes.—It is a desirable thing to have Potatoes as good in May as in the autumn. Having a few large tubers of Matchless or Holborn Favorite left after planting was over, I cooked them to test the quality, and found they dished up as white, dry, and mealy as a good Regent would be at Christmas, and far better than any Regent would be now. That an American-raised Potato should have such first-rate quality is a novelty. The tubers are rather long, of a high level, and are now giving its kinds worth eating. Schoolmaster, though the tubers had somewhat pushed, cooks finely, and as a mashed dish was delicious. Bedford Prolific, though naturally earlier, also cooks yet superbly, its touch of yellow in the flesh helping to give that flavour we have been accustomed to in the Lapstone. Specially good is Woodstock Kidney, which, however, has not been largely inquired for, chiefly because it is far from being disease-proof. On the other hand, Magnum Bonum and Champion seem as little in request, because both are more or less disease-resisting, and therefore have so enormously increased. Both cook well, and will do so till new ones come in. Some kinds seem almost to be improved when they have been sprouted a little, but it would not do to assert this as a rule, because others become soft and sweet when so treated. I find Potatoes intended for the latest consumption kept best in boxes or tubs, and placed in a cool, not very dark, and well-ventilated, and every few weeks, and rubbed over to prevent sprouting. If tubers are sound they want neither lime-dust nor any other mixtures with them, whilst no kind of dressing will help to keep partially diseased tubers for any length of time. No doubt many other kinds than those named will keep well and late, but these few serve to show that we are not without good keeping varieties. *A. D.*

Wistaria sinensis.—One of the largest, if not the largest, Wistaria that I have ever seen is now in full beauty here (Lancome estate, South Devon), and I should be glad to know whether it has an equal and where. Its mode of growth and dimensions are as follows:—It is planted at one end of the kitchen garden and is trained against the east wall. The garden is divided into four quarters by cross walls, and is situated upon the slopes of a steep hill so that the plant rises and falls with the different elevations of the walls. The plant is 4 feet in circumference at the base and at 3 feet from the ground branches into two large stems which are placed round each other and look very curious and grotesque. The height of the wall is 12 feet. The plant travels along one wall a distance of 46 feet, crosses a walk 12 feet in width, ascends a second wall perpendicularly to a height of 12 feet, and then travels a distance of 58 feet more, or a distance of 140 feet, in all. The contortions of the stems and the journey they travel in such a peculiar fashion lend an interest to the plant especially now when it is clothed with drooping clusters of its well known lovely flowers. *H. L. C.*

Mackaya bella.—With reference to the remark at p. 566, that this plant does not flower every year either at Kew or Pendell Court, it may be of interest to know that it does flower every year in the Cambridge Botanic Garden. The reason appears to be that the roots are so restricted as to prevent a luxuriant growth which could not be ripened. Everything depends on maturity, and root confinement is an aid to this end. Some sacrifice of handsome foliage in this case appears necessary to secure flowers with certainty. *R. J. L.*

Lilies of the Valley for Forcing.—Those who are desirous of having Lilies of the Valley finer than usual next winter should borrow a leaf out of the cultivator's book in the Exeter Nursery, and plant out the stock for forcing forthwith in a heated pit facing the south. Such accommodation for forcing these favourite winter flowers is rarely to be met with, but it may be taken for granted that the system, if it would not be adopted in a nursery, is not required. It should be stated that the hot-water pipes are not needed at present but in the winter, so that the flowering period may be accelerated as there is demand for the flowers. Nor does it need the wisdom of a philosopher to state that plants that are forced in the same posi-

tion where they are established will produce a greater number of finer blooms than if they are moved immediately before forcing is commenced. But perhaps the great point gained is that the plants make early growth and are well nourished until that growth is matured under the system referred to. At all events the leaves of the sample to which reference is made are twice as large as those ordinarily seen, and are as green as Leeks—a sure sign of what may be expected next autumn. The plants will naturally ripen their growth early, and will be ready for forcing again long before plants subjected to ordinary treatment have gone to rest. The pit in which the plants are established is a low one attached to the south side of a span-house running east and west, and is heated by a flue and return 4-inch pipe. In addition to this it would be an advantage in very early forcing if bottom-heat were also provided, in which case a supply of early flowers would be a certainty. *H. H.*

The Black Italian Poplar.—This is, I believe, the fastest growing tree which we have, and I wish one could convince every landed proprietor in this country that there is on almost every estate a tree which is producing little or nothing but would grow this tree to perfection; it matters not if the situation is damp or even wet, and the soil as stiff as brick-earth, still it will flourish, and positively, so to speak, rush into timber. A friend of mine emigrated to New Zealand, and wishing to give his new residence as soon as possible an air of antiquity planted this tree plentifully, amongst others, on his estate, and soon the buildings were sheltered and the cattle ruminating under its shade. There are hundreds of purposes its wood can be put to, but I will mention three for which it is pre-eminent. The first is packing-cases; the wood does not easily split, and being very difficult to burn it is very safe for cottage and other flooring, but for railway buffers it has, I believe, no equal. There are several fine specimens on this estate, and during the very violent gales which swept across this part of the island last autumn several trees, in common with others, were uprooted. Old men on the estate assured me they remembered the planting of the tree, and that the tree must be the annual growth of the butt-end, and found sixty circular rings, and the measurement of the finest tree was 217 feet of timber. Now here was a tree as sound as a bell, which had been planted, grown, and cut down during the memory of living men; grown in soil which in winter was like bird-lime, and where it was next to impossible to drain it; and tell me, reader, if you can, what tree under such circumstances would produce half the money? *J. Kist, Bridge Castle.*

Bad Flower Seeds.—All that "Mervyn" has written at p. 538 respecting the difficulty he has experienced in raising certain purchased seeds is doubtless true, but it would be unfair because of that to promote charges of dishonesty against the seed trade. It must not be forgotten whilst "Mervyn's" testimony is that of one, purchasers of seeds from seed firms are counted by tens of thousands, and were his experience general we should long ere this have met with an universal chorus of imprecation; in fact, the seed trade must be now have gone to the dogs. All who are conversant with the seed growing business will admit that the care exercised in the sowing of not only sound healthy seed but also of the best and purest strains is remarkable, and that it is productive of good results is evidenced in the fact I have alluded to, that the mass of customers are satisfied. It cannot be too widely known that the choicer the strain of almost any kind of seed-bearing plants, (Chinese Primrose, Anemolas, Cinerarias, Pansies, and similar things, the less freely does the plant seed. Still further the less freely it is fertile. If in the case of such seeds that are literally worth their weight in gold, and which can only be sold at a profit in quantities so minute as to be absurdly disappointing to the purchaser the seedsman should add a little milled seed it is not because he wishes to deceive his customers, but because he understands how in relation to these very choice seeds the customer is unreasonable and will not be satisfied unless he gets bulk for his money. "Mervyn" found that purchased seed Auricular seed, though the bulk was great, came badly. That will surprise no one who has sown seed from really fine show kinds, for whilst the seed is very scarce, at least one half is rarely fertile, and growers of choice sorts will have read with incredulous astonishment that "Mervyn" got 100 seedlings from three pods only. His could not have been a very refined show kind, and perhaps his Chinese Primrose strain was of the same order. In any case it will not do to be too much hasty to impute dishonest practices. *A. Sed. Grower.*

Varieties of Melons.—The number of new Melons of late years has caused not a few sarcastic and ungracious remarks. No one can gainsay that good examples of Bailey's Green-flesh, Cashmere, and perhaps Golden Gem are equal to any of the new varieties, yet even allowing this to the full, the progress exhibited in the new kinds is great. In the first

place the growth, and what for want of a better term is called the "selling" qualities of the new kinds, are stronger and better. In the second place they combine size and flavour. Lastly, in appearance and keeping qualities there is a distinct advance. In the green-fleshed kinds William Tillyer has driven out Victory of Bath, Horticultural Prize, and others of that ilk, but it has already been far from unsuccessfully opposed by High Cross Hybrid. The raiser of the latter gave the public every opportunity of inspecting his seedling, and in appearance, size, free growth, and all the other good qualities of a Melon it is pre-eminent. As far as I know these two varieties are not only as different as can be from each other, but from anything that has preceded them. Through the courtesy of Messrs. Sutton and Mr. Koss I am this year growing Welford Park, which has already received a First-class Certificate from the Royal Horticultural Society; it shows the same freshness and hardihood of growth which distinguishes the other new sorts. The standard of flavour in "Best of All" is not nearly high enough. In the scarlet-fleshed varieties progress is equally positive. Until lately no scarlet-fleshed Melon took so many prizes as Turner's Scarlet Gem; now there are at least six surpassing sorts, that combine size and flavour. The caution cannot be too often repeated against growing two or more sorts of Melons in the same house when the seed is required. In the case of some new Melons every seed has come different. *William Carmichael.*

Pyrus floribunda.—The finest thing among deciduous shrubs now in bloom is *Pyrus floribunda*, the long twiggy pendulous shoots of which are laden with blossoms. In habit and character it has much the growth and appearance of a Morello Cherry; but instead of the blossoms being white, they are flushed with rosy-pink like those of the Apple, and a tree or bush of it is, therefore, an object of great beauty. For a single specimen on a lawn nothing can be finer than a standard of this lovely *Pyrus*; but as it flowers early it is necessary for it to have a sheltered situation where the wind cannot get at it to knock it about. Besides being valuable for planting on lawns, it is well adapted for shrubberies in the foreground of large evergreens; but wherever placed it should have plenty of sun, which is requisite as an aid to ripen up and harden its shoots. The way to propagate this *Pyrus* is to put in cuttings early in the autumn, and if these are made of the young wood, and inserted in sandy soil, they will root the following spring. *J. S.*

Florists' Flowers.

EARLY TULIPS AT CHELSEA.—One of the most successful illustrations of the usefulness and beauty of the race of early flowering Tulips as bedding plants in spring is now being furnished at the Chelsea nurseries of Messrs. James Veitch & Sons. If it be true that the late flowering florists' Tulips can no longer be grown in Camberwell, Peckham, Holloway, and other suburbs of London, owing to the encroachments of the builder and the rapid growth of suburban populations, it is yet quite certain that as far as the Chelsea nurseries are concerned the early Tulips bloom as finely there as in the most favoured spot in the open country. In Hyde and the Regent's Park the early Tulip succeeds well also, and it can be safely regarded as a plant much better adapted for town gardens than is generally supposed.

There are at Chelsea two oblong panels of beds of varying shapes, comprising seventeen beds each, and they are parallel to each other on either side of the broad central walk through the nursery. They are similarly planted in regard to the sorts, and they serve to suggest (with the exception of a little modification of the position of the different sorts in regard to height) how the beds on a terrace garden might be planted, and the sorts to be had for the purpose. There are in all in about two dozen varieties, and the leading idea has been to test the simultaneous blooming of these varieties, and with but few exceptions the sorts to be named may be taken as representing a collection that can be satisfactorily employed to secure a full display of bloom at a given period.

Of the varieties employed, the self-flowering shall first be noticed. Of the scarlet or crimson selfs I place La Belle Alliance at the head of the group as an effective bedding variety; it is of a rich bright scarlet crimson hue, fine in build as well as colour, and not exceeding 9 inches in height, so that a bed of it presents a very regular and even appearance. Couronne

Pourpre, or Purple Crown, is of a reddish-crimson colour, and makes a very effective display in a bed: it has one good quality, that the colour deepens to a rich crimson with age. It is a taking and distinct sort, growing to the height of 9 inches, and it goes well with Yellow Prince. Brutus is nearly a self; it is of an orange-red colour, with a slight feather of orange, and makes a nice dwarf bedding variety, of regular growth, averaging about 9 inches in height.

Of the purple and violet selfs the two darkest are Vander Neer and Wouwerman; the former has the darkest hue of colour, the flowers of fine build, large, and of almost perfect shape. It is a little early for bedding purposes; that is to say, it comes into bloom before the general body of varieties grown for the purpose. For pot culture it cannot be surpassed, and when at its best reminds one of a fine breeder Tulip of the late Dutch or florists' type. Wouwerman is a little taller in growth, about 12 inches, is of a good hue of purplish-violet, and is highly satisfactory as a bedding variety. It lacks the fine build of Vander Neer. Proserpine is of a pretty violet-rose shade, a flower of large size and superb build, growing regularly, and making a good bed. It is a little early, but cannot be dispensed with. It is one of the best varieties for pot culture. Queen of Violets is of a very delicate shade of violet, and with age it becomes flamed and tinted with white. When at its best it is of a delicate rosy-violet colour, but pales as it ages. It grows to about 12 inches in height, and is excellent for pot culture. Pot Potter is a newer variety, of a distinct shade; it is of a purplish-rose, with the purple predominating; lively in hue, rather tall for bedding purposes, and a little late in flowering; very pretty and distinct.

Of the cerise selfs, Paul Morelle is one of the best; it is of a deep cerise shade, rather small in size, a little dull looking, and white at the base of the bulb inside, but a good and effective bedder. Cramoisie Superbe is of a delicate rosy-cerise colour, shaded with bronze, a little tall, growing from 12 to 15 inches in height; very pretty and distinct.

Of the orange and yellow selfs, Thomas Moore still holds its own as a useful and effective bedder, being very regular in growth, while the flowers are of excellent shape; it is very distinct and highly attractive. Of the yellow varieties, Yellow Prince was the only one in the Chelsea trial. Nothing else comes in just at the time this does; it is at its best with Keizer's Kroon, Proserpine, and La Belle Alliance. It is of a dwarf, sturdy, and regular growth, and makes a charming bed. Chrysolara is an excellent yellow Tulip, but is too early for bedding; it does best cultivated in pots.

Of the edged Tulips, Keizer's Kroon takes the leading place. It is a tall growing variety, and quite early, looks most imposing in a bed, and is the largest in size of all the early Dutch Tulips; as a pot variety it is unsurpassed. Duchesse de Parme is later, dwarfier, and smaller in size than Keizer's Kroon, and is a good bold variety for massing. It lacks the broad edging of gold which makes Keizer's Kroon so conspicuous, as in this respect it has a much narrower edge, and it is a good pot variety also. Duchesse d'Autriche is a broken form of this, that is to say, the coloured base is flamed and streaked with yellow, and though it makes a good bed it is not so effective as the unbroken form. La Remarquable is of a lively rosy-claret ground colour, edged with white, and feathered also with the same; a little late in flowering, but very pretty and distinct. Monument has a deep cerise ground, and is edged and flamed with white; a few are nearly self-coloured, and then we get Cramoisie Superbe, as Monument is a broken form of this. It makes a very pretty bed.

Then we come to a class that might be termed variegated Tulips, in which a deep ground colour is flamed and streaked with a paler colour. There is Joost van Vondel, which is often of a rosy-crimson self colour, though its correct form is striped slightly with white. It is sometimes heavily striped in this way, and there is a pure white sport also. At its best it is of a rich bright reddish-crimson ground, slightly pencilled with pure white. It makes a very good bedding Tulip, one of the best in fact; it averages 10 inches in height and is very regular in growth. Rose Grisdelin is a very pretty Tulip, the colours are equally white and pink or delicate rose; it is very dwarf, rising to 6 or 8 inches, and there is an attractive combination of colours; it is also very regular in growth. Cottage Maid is white and pale bright rosy-pink; a very pretty dwarf Tulip and an excellent

bedder. Rose Aplatie is a remarkably attractive Tulip, white and pink—whitest when it opens, and becoming darker as it ages; very pretty and a good bedder. The three last-named, though of the same combinations of colour, are yet essentially distinct. La Respectable has a pale magenta ground flamed and striped with white; dwarf, distinct, and very tall, too late indeed to be used effectually with others. Golden Standard is red and yellow, a sport from the red and white Royal Standard; bright and effective, a good bedder, dwarf and showy.

There yet remain the white Tulips. Of the good old white Pottebakker it is scarcely necessary to treat, it is so well known and so thoroughly good for all purposes. Arms of Leyden is a good white Tulip, not so good in shape and size as white Pottebakker, or so pure, but yet a thoroughly good bedder, coming in at a good time; it is dwarfier than the foregoing. Grootmeester van Maltha is a white Tulip, but occasionally comes suffused with delicate rose like Rosa Mundi; when true, a good pure white Tulip, but rather late in flowering. Lastly comes Comte de Mirabeau, a pure white variety, having a regular habit of growth, earlier to flower than the preceding variety, coming in with Joost van Vondel; not a large flower, but of fairly good size as a bedding variety, and very useful in the flower garden.

Tulips remain longer in bloom than is generally supposed, but much depends on the character of the weather. At best the beauty of the Tulip is not greatly prolonged, and it is therefore desirable that the beds in which they are planted be carpeted with some later and more durable flower to succeed the Tulips. It is not the purpose of the writer to indicate in this relation the plants best suited for the purpose, but there are many useful subjects that can be employed.

The best nine bedding Tulips comprise Keizer's Kroon, Proserpine, Vander Neer, Joost van Vondel, Thomas Moore, La Belle Alliance, Comte de Mirabeau, Rose Grisdelin, and Yellow Prince. Add Monument, Queen of Violets, and Proserpine, and we get a dozen varieties that can scarcely be improved upon for pot culture. But let Tulips be grown in or out of pots, to have them at their best they must be grown generously. In the open air they need a good position, well drained beds, a suitable and rich soil, and such attentions as are indispensable, and the spring garden will be gay with a wealth of forms and flush of hues that will—

"Fill the garden with a joyful blazon
Of Tulips in the morning rays."

R. D.

THE CINERARIA.—Those who have followed previous directions as to the treatment of these showy greenhouse flowers will now be reaping the fruits of their care and labour in a brilliant display of colour. In order to keep them in flower as long as possible they must be kept cool by having plenty of air admitted without exposing the plants to cutting winds. They must also be shaded from bright sunshine, of which they are very impatient. When the pots are well filled with roots they take a good supply of water, and would soon suffer if allowed to become dry. If it is necessary to retard any of the plants for exhibition or other purposes, the best way is to place them in a house with a north aspect, where they get but little sun, while they have a better light than they get under canvas shading. Exhibition plants should be tied and stuck out a week or two before they are required, to produce a uniform surface of bloom. A few plants of the very best varieties should be placed aside from which seeds may be saved, as it is only by judicious selection that progress can be made. Good form and brightness of colour in the flowers, and dwarf compact habit of the plants, are the objects sought after. The named varieties that have done flowering ought now to be cut down, and the plants should be placed in cold frames behind a north wall, where they will begin to produce growths from the base of the stem. The double varieties of the Cineraria are so much improved now that they cannot fail to be admired. These must also be treated in the same way as other named varieties. J. D.

THE CARNATION AND PICOTEE.—About a month ago advice was given to have all the stock of these potted without any delay. Our own stock had been potted at that time. I find, however, that even now some growers have not yet finished potting; probably this is not because they think it best to repot late, but from inability to do so before. Our own

plants, which had been kept in frames until now, have just been turned out-of-doors, where they were exposed to more heavy showers during the last few days than will be beneficial to them; but as the pots were pretty well filled with roots the plants cannot suffer injury to anything like the extent they would if they had been potted and turned out at once. The whole stock of them had grown so much that it was necessary to place sticks to them when they were placed out-of-doors; any of the plants attacked with greenfly had the pest removed from them at the same time. The pots should be placed on a dry, hard, and level piece of ground, over which a thick coating of ashes should be placed. The perpetual flowering section are being very much improved, and are amongst the sweetest of garden flowers. The new varieties exhibited last week by Mr. C. Turner, of Slough, are certainly a considerable advance on the varieties already in cultivation. They are alluded to at p. 505. Mr. George Palfield, gr. to Horace K. Mayor, Esq., of Wincborne Hill, has also raised some very pretty and distinct varieties. Alice Duffield is quite a novel flower of considerable merit. The prominent feature in all our good new varieties should be a free-flowering dwarf habit. This has been obtained in Mr. Turner's varieties by crossing with A. Alegatière. I would like to impress upon those who are anxious to obtain fine flowers next winter that they must carefully attend to the plants now. If the cuttings were struck in January, February, or March, they will now be growing freely in cold frames, and if potted on as they require, they will be 8-inch pots by the end of September, when they will begin to flower, and continue to do so in a temperature of 55 all through the winter. J. Douglas.

Reports of Societies.

NATIONAL AURICULA (Northern Section). May 2.—This exhibition was held in the Town Hall, Manchester, on the above date, and, like its sister meeting held in London last week, was a decided success. The largest class being for six varieties, there were not the strong points of the collections of fifty and twelve plants as seen at South Kensington. The number were at times small, and it must be said of general good quality. A few flowers, such as George Lightbody, Alexander Meiklejohn, Lancashire Hero, Prince of Greens, Acme, Richard Headley &c., were conspicuously fine—the second of these was so well preserved that it was a good deal that it appeared to be Alexander Meiklejohn's specimen in the North, and some superb examples of it were forthcoming. Mr. W. Bolton, of Warrington, the Hon. Sec. to the Northern Division, was 1st in the class for six dissimilar Auriculas, six being very fine examples of Prince of Greens, Frank Simonite, George Lightbody, Alexander Meiklejohn, Lancashire Hero, and Mrs. Douglas, the fine new violet self raised by Mr. B. Simonite, Sheffield; 2d, Mr. Jonathan Booth, Falls-water, who had two fine examples of George Lightbody, A. Meiklejohn, Frank Simonite, Lord of Lords, Dr. Horner, and Colonel Taylor; 3d, Mr. H. Wilson, Halifax, with A. Meiklejohn, George Lightbody, Prince of Greens, John Simonite, Sapphire, and Colonel Taylor; 4th, Mr. S. Barlow, Stakelink, with Lovely Ann, Lancashire Hero, syde, and completely new, Erebus, and Ringdove, two fine selfs raised by the Rev. W. D. Horner; 5th, Mr. H. Pohlman, Halifax; 6th, Mr. B. Simonite. In the class for four dissimilar Auriculas Mr. H. Wilson was 1st, with Acme (Read), Ringdove, Prince of Greens, and Alexander Meiklejohn; a very good lot indeed; 2d, Mr. Shaw, Bury, with Dr. Horner, Ellen Lancaster, a conspicuous dark self; A. Meiklejohn, and George Lightbody; 3d, Mr. H. Pohlman, with George Lightbody, Acme, Topsy, and Colonel Taylor; 4th, Mr. W. Bolton, with Lancashire Hero, Acme, and George Lightbody, and Topsy; 5th, Mr. B. Simonite. In the class for the best two Auriculas, Mr. Robert Lord, Todmorden, was 1st, with Colonel Taylor and George Lightbody, in fine condition; 2d, Mr. John Bewick, Middleton, with Charles J. Perry and Traill's Anna; 3d, Mr. W. Bolton, with Alexander Meiklejohn and Ringdove; 4th, Mr. J. Booth, with Ellen Lancaster and Dr. Horner; 5th, Mr. W. Taylor; 6th, the Executors of the late Thomas Mellor.

In the class for a pair of Auriculas shown by maiden growers, the 1st prize was won by Mr. Beady, who had Charles and Traill's Anna; 2d, Mr. Shibley, with Smiling Beauty and Richard Headley; 3d, Mr. Prescott, with Mrs. Sturwell and Dr. Horner; 4th, Mrs. G. Shaw, with Traill's Beauty and Meteor Flag.

In the classes for single plants there was, as usual, a large number staged. The premier green-rose was Lancashire Hero, in its green form, from Mr. Pohlman; 1st, Mr. R. Lord, with Colonel Taylor; 2d, Mr. W. Bolton, with Talma; 3d, Mr. Rogers, with May Flower; 4th, Mr. H. Pohlman, with Laurel, a lively-looking variety, with a pale green edge; 5th, Mr. J. Booth, with George Lightbody; 6th, Mr. H. Pohlman, with Lancashire Hero; 7th, Mr. B. Simonite, with a seedling; 8th, Mr. Bolton, with Lovely Ann. The premier grey-rose was Alexander Meiklejohn, from Mr. H. Pohlman; 1st, Mr. H. Wilson, with Mrs. G. Shaw; 2d, Mr. H. Wilson, with George Lightbody; 3d, Mr. H. Pohlman, with Lancashire Hero; 4th, Mr. B. Simonite, with Samuel Barlow; 5th, Mr. J. Booth, with Dr. Horner; 6th, W. Brockbank, Esq., with Ne plus ultra; 7th, Mr.

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, MAY 3, 1882.

Table with columns: MONTH AND DAY, BAROMETER, TEMPERATURE OF THE AIR, WIND, RAINFALL. Includes data for April and May.

April 27.—A fine day; overcast generally. Fine clear night. 28.—A dull, rainy morning. Fine bright afternoon, with occasional passing showers of rain. Fine clear night; windy. 29.—Fine in early morning; a dull, rainy day. A gale of wind during the day; strong wind all day. Night generally fine and clear. May 1.—Rain in early morning. A fine day; sun shining. Fine night. 2.—A very fine bright day; sun shining; passing showers of rain. Cloudy night. 3.—A very dull morning. Fine bright warm afternoon. Fine warm cloudy night.

LONDON: Atmospheric Pressure.—During the week ending April 29, the reading of the barometer at the level of the sea decreased from 29.52 inches at the beginning of the week to 29.27 inches by 9 A.M. on the 23rd, increased to 29.54 inches by midnight of the 24th, decreased to 29.19 inches by midnight on the 25th, increased to 29.28 inches by 9 A.M. on the 27th, decreased to 29.25 inches by 9 A.M. on the 28th, increased to 29.53 inches by 9 A.M. on the 29th, decreased to 29 inches by 5 P.M. on the same day, and was 29.46 inches by the end of the week.

The mean reading for the week at the level of the sea was 29.41 inches, being 0.41 inch lower than last week, and 0.51 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 58° on the 24th and 28th. On the 26th the highest temperature was 49° 5'. The mean of the seven high day temperatures was 53° 7'.

The lowest temperature in the shade in the week was 36° 5', on the 26th; on the 23d the lowest temperature was 47°. The mean of the seven lowest temperatures was 46° 6'.

The greatest range of temperature in one day was 17° 5', on the 28th; the smallest was 9° 8', on the 23d. The mean of the seven daily ranges was 13° 1'.

The mean temperatures were, on the 23d, 50° 5', on the 24th, 49° 3'; on the 25th, 44°; on the 26th, 42° 6'; on the 27th, 43° 7'; on the 28th, 46° 5', on the 29th, 44° 4'; the two first, the 23d and 24th, were above their averages by 2° 5' and 1° 1' respectively; all the rest were below their averages by 4° 3', 5° 9', 5', 2° 4', and 4° 7' respectively.

The mean temperature of the air for the week was 45° 9', being 3° 5' lower than last week, and 2° 7' below the average of the week.

The highest reading of a thermometer with blackened bulb in vacuo, placed in the full rays of the sun, was 122° 5' on the 28th; the highest on the 29th was 54° 5'.

The lowest reading of a minimum thermometer with its bulb placed on grass and fully exposed to the sky was 34° on the 26th and 27th. The mean of the seven readings was 35° 9'.

Rain.—Rain fell on six days, to the amount of 1.91 inch, of which 0.83 inch fell on the 25th.

ENGLAND: Temperature.—During the week ending April 29 the highest temperatures were 64° at Sunderland, 1, 62° 5' at Plymouth, and 61° 1' at Cambridge. The highest temperature at Bradford was 53° 6', at Liverpool was 54° 5', and at Hull and Leeds was 55°. The general mean was 57° 7'.

The lowest temperatures in the week were 31° at Nottingham, 33° 8' at Leicester and Bolton. The lowest temperature at Truro was 40°, at Plymouth was 39°, and at Leeds and Sunderland was 37°. The general mean was 35° 8'.

The greatest ranges of temperature were 28° 1' at

Nottingham, 27° at Sunderland, and 25° 5' at Cambridge. The least ranges were 16° 7' at Bradford, and 18° at Truro and Leeds. The general mean was 21° 9'.

The mean of the seven high day temperatures was highest at Plymouth, 57° 5', Cambridge 57°, and at Sunderland 57° 1'; and was lowest at Bolton, 50° 1', at Bradford 51° 7', and at Liverpool 51° 8'. The general mean was 54° 1'.

The mean of the seven lowest night temperatures was highest at Truro and Plymouth, 44° 3', and at Leeds, 42° 1'; and was lowest at Wolverhampton, 38° 3', at Bolton 39° 5', and at Leicester 39° 6'. The general mean was 41° 2'.

The mean daily range was greatest at Cambridge and Sunderland, 16° 7', and at Nottingham, 15° 9'; and was least at Bradford, 9° 8', at Liverpool 10° 2', and at Bolton 10° 6'. The general mean was 12° 9'.

The mean temperature for the week was highest at Plymouth, 49° 3', at Truro 48° 5', and at Brighton 47° 4'; and was lowest at Bolton, 43° 2', at Wolverhampton 43° 5', and at Leicester 44° 7'. The general mean was 46° 1'.

Rain.—The largest falls were 2.86 inches at Bolton, 2.77 inches at Bristol, and 1.04 inch at Blackheath. The smallest falls were 0.84 inch at Nottingham, 1 inch at Leeds, and 1.23 inch at Liverpool. It fell on every day in the week at Truro, Plymouth, Brighton, Cambridge, and Bolton. The lowest number of days it fell was four, at Wolverhampton; all others were five or six days. The general mean fall was 1.55 inch.

SCOTLAND: Temperature.—During the week ending April 29 the highest temperature was 58°, at Paisley; at Leith the highest temperature was 52°. The general mean was 54° 3'.

The lowest temperature in the week was 30°, at Paisley; at Aberdeen the lowest temperature was 36° 1'. The general mean was 37°.

The mean temperature for the week was highest at Paisley, 46° 7'; and lowest at Edinburgh, 44°. The general mean was 44° 9'.

Rain.—The largest fall was 0.95 inch at Aberdeen, and the smallest was 0.45 inch at Glasgow, Dundee, and Greenock. The general average fall was 0.58 inch.

JAMES GLAISHER, F.R.S.

Answers to Correspondents.

- ARUM: J. T. C. Not at all an uncommon occurrence.
CALCEOLARIAS: H. Cannell & Sons. A strain of large flowers, very bright, with a well varied range of colours, and very effectively marked.
CINERARIAS: F. C. L. Smith. The flowers are 50-60 in form and colour, but very delicate in size.
GLASTHURP SPINACHERS: Mary Anne. Probably an error on the part of the correspondent.
HIBETUS: O. Some inquiries were made some time since 32 on this Fabian flower, which is better known than his history. George Denis Euret was a German painter, b. 1710, ob. 1770. He came to England, and was employed by Sir Hans Sloane to illustrate several Memoirs in the Philosophical Transactions. His name Sceticus was published in 1720. Further information may be gleaned from the Noctuides Biographie Générale, vol. xv, p. 751.

FRUITS TO NAME: Ph. Immel. We cannot name your fruits with certainty at this late period of the season. They are all much rubbed and discoloured. This is always the case with Apples at this season. No. 5 may be Pear's Pippin; 4, Beauty of Kent.

INSECTS: Phylloxera. Your Ivy is attacked by minute insects nearly allied to the common Acanthosyllabus, or red-spidder, having similar habits of frequenting the leaves of garden plants in vast numbers, and sucking the juices of the leaves, to which they give the appearance of being covered with minute pale blotches. It appears to be the Bryobia pretiosa, Koch, being of a dark chocolate colour with pale red head and legs. I. O. W.

MULDY ON ROSES: A. P. The spores or seeds are in the air, and are deposited on the leaves, &c., where they grow. They do not come from the roots. Dust the affected leaves with flowers of sulphur, and keep the atmosphere drier.

NAMES OF PLANTS: F. Drury. Clerodendron Balouianum.—Pala. No. 1. There are two Lichens present in the specimen sent, of which the one is Cladonia sylvatica, sterile, and the other (with scarlet apothecia) is Cladonia crocospicoides.—Anagrostis. Oncidium leucociliatum.—C. M. Tulipa sylvestris.—F. P. 1. Magnolia purpurea; 2. Spruce Thunbergii; 3. Pyrus atomata; 4. Pyrus Malus spectabilis; 5. a garden variety of Pear; 6. Davallia canariensis; 7. Celsia cretica.—E. D. 1. Epimedium macranthum; 2. E. alpinum; 3. Dondia epipactis; 4. Erythronium grandiflorum; 5. Chrysosplenium oppositifolium; 6. Pyrus salicifolia; 7. Fuchsia alpina; 8. Trillium erectum. Please pay the full postage next time.—H. F. Clayton. Rhododendron Nuttallii, not K. Aucklandii.—F. P. Oncidium sphaerulatum majus.—J. A. Robertson. Ficus rubiginosa—a native of Australia; fruit not likely to be eatable.—F. H. N. I doubt one of the roots is of Cereus cespense, but flower material too scanty to be sure.—

R. Simonite, with Garibaldi; 8th, Mr. Pohlman, with Confidencio. The premier white-edge was Acme, from Mr. R. Lord, 1st, Mr. J. Booth, with Richard Headley, very pretty indeed as a white; ad, Mr. R. Gorton, with John Wateron; 3d, Mr. Wilson, with Acme; 4th, Mr. Pohlman, with Smiling Beauty; 5th, Mr. Wilson, with John Simonite; 6th, Mr. Lord, with Catherine; 7th, Mr. Booth, with Trail's Beauty; 8th, a seedling.

The premier self was Mr. Douglas, shown by Mr. R. Simonite, 1st, Mr. J. Booth, with C. J. Perry; 2d, Mr. Booth, with Mrs. Sturges; 3d, Mr. Bolton, with Ellen Lancaster; 4th, Mr. Pohlman, with Lord of Loree; 5th, Mr. R. Lord, with Lord Clyde; 6th, Mr. Pohlman, with Mazine; 7th, Mr. Brockbank, with Metropolitan; 8th, the same, with Toppy.

The selection of the premier Auricula required some nice discrimination. Eventually it was resolved that two flowers should be declared equal in point of merit, viz., a very fine Lancashire Hero, shown by Mr. S. Barlow, and Alexander Meiklejohn, shown by Mr. H. Wilson.

There were numerous shown, and many of the shaded flowers were very handsome indeed. In the class for four varieties Mr. J. Booth was placed 1st with George Lightbody, Elcho, Queen Victoria, and Brilliant; 2d, Mr. W. Adams, with Queen Victoria, Diable, Mrs. Leaven, and Colonel; 3d, Mr. Gorton, with Neatness, Queen Victoria, and seedlings; 4th, Mr. Shaw, with Conspectus, John Leach, Diable, and Mr. Spangle; 5th, Mr. R. Gorton, Diable, Mr. Meiklejohn, Elcho, and Miss Red; 6th, Mrs. Geggie. The premier alpine, with yellow flowers, was shown by Mr. Booth, 1st, Mr. Shaw, with Diable; 2d, Mr. Pohlman, with a seedling laced variety; 3d, Mr. Adams, with Colonel Scott; 4th, Mr. Shaw, with Spangle; 5th, Diable. The best white-centred alpine was a seedling laced variety from Mr. H. Pohlman, 1st, Mr. Gorton, with Elcho; 2d, Mr. Pohlman, with a seedling laced; 3d, Mr. Gorton, with Sunset, a pretty but thin light variety; 4th, Mr. Booth, with Tennial; 5th, Mr. Gorton, with George Lightbody. The fact that shaded flowers alone can be shown at Manchester excluded from competition a large number of the fine self varieties raised by Mr. C. Turner, of St. George.

In the classes for gold-laced Polyanthus there was a remarkably good competition, and some highly-refined flowers were shown. Mr. J. Beswick, Aldridge, had the best three black ground varieties, staging the Lancashire Hero, a seedling of the Cheshire Favourite type, paler in the centre, and with a neat wide lacing; 2d, Mr. W. Bolton, with Exile, Lord Lincoln, and Zoe, a pretty seedling of great promise; 3d, Mr. S. Barlow, with Beauty of England, Exile, and Harbinger, a new and promising variety; 4th, the excusers of Mr. T. Melior, with Cheshire Favourite and two seedlings; 5th, Mr. T. Prescott. Mr. Barlow had the best three red-ground varieties, staging Model, Firefly, both his own seedlings, and very promising indeed; and the true forms of Cows Regent, ad, Mr. J. Beswick, and George IV., Laner, and a seedling; 3d, Mr. W. Bolton, with President, George IV., and a seedling; 4th, Mr. Prescott.

The premier red-ground flower was George IV. 1st, the same; 2d, Model; 3d, Prince Regent; 4th, Red Rover; 5th, Firefly. The remaining seedlings: The premier black-ground flower was Lord Lincoln, very fine indeed. 1st, Exile; 2d, Lancashire Hero; 3d, Cheshire Favourite; 4th, John Bright; 5th, Earl of Lincoln; 6th, President.

Mr. S. Barlow was the only exhibitor of twelve fancy Polyanthus, among some pretty and rare things; and W. Brockbank, Esq., was the only exhibitor of twelve fancy Polyanthus and twelve Primroses, 1st prizes being awarded in each case.

The show was supplemented by a few groups of plants of a very attractive character. Mr. Rylands, Esq., Longford Hall, Stretford, sent a group of flowering and foliage plants, foremost among the latter being such a plant of Adiantum palmatum as one rarely sees. It was admirably grown, and in the best possible condition. From T. Agnew, Esq., Eccles, came two plants of Dentaria gracilis, finely grown and flowered. From the gardens of the Society Mr. Findlay sent an attractive group of plants that greatly helped the show. Messrs. Standish & Co. sent from their Ascot Nurseries a group of Rhododendrons in pots, Lily of the Valley, &c.; &c. also a group of cut blooms of Gardenias, Niphedos Russes, &c., all in fine condition. From S. Schloss, Esq., Bowden, came handsome trusses of Rudbeckia macrophylla of snowy whiteness that were much admired. E. Rogerson, Esq., sent a group of dwarf herbaceous Polyanthus, well grown and flowered, and a first, but not best. Mr. W. Brockbank had a charming group, consisting of varieties of Primula Sieboldii, Iberis gibraltarica hybrida, Orchis maculata, Gentiana acutilis, Campanula alpina, Primula japonica alba, and excellent Ferns, &c.

Altogether the show was a great success; the weather was fine, and a number of persons filled the spacious Town Hall during the time the show was open.

Obituary.

OUR correspondent at Manchester writes:—"A mournful feeling appeared to be general among the Auricula cultivators present at the show in the Manchester Town Hall on Tuesday, for on Sunday died at Halifax Mr. THOMAS WOODHEAD, a renowned and most successful grower; and on Monday there died, at Ashton-under-Lyne, worthy THOMAS METTOS, both members of the Northern Committee of the National Auricula Society."

C. W. D. 1. Veronica Teucrium, the form called V. prostrata; 2. V. serpyllifolia; 3. Waldsteinia sibirica; 4. W. fragarioides—C. H. Coronilla Emerus.—C. M. Emmott. Staphylea pinnata, a native tree, that will do best if left alone.—L. Alouepicus geniculatus, in all probability quite as good as A. pratensis.—A. The sweet smelling grass is Anthoxanthum odoratum, the other plant Luzula campestris.

NITROGEN, AMMONIA, &c.: Practical.—1. The statement in a foot-note to my lecture that 7 lb. of nitrogen are nearly worth 15. is a misprint; it should stand "1 lb. of nitrogen has the value of nearly 15." This error has been corrected in the following number of the Society of Arts Transactions. 2. It is not denied that ammonia can act as a plant food, but it is so speedily converted into nitric acid in the soil that nitric acid rather than ammonia is practically the source of nitrogen to plants. It is mentioned in my lecture that on one occasion the drain-pipes ran forty hours after the application of ammonia salts to the land; the drainage water showed, nevertheless, a distinct increase in the quantity of nitrates present. R. Warrington.

PERLAGKONIUM CRIMSON KING.—H. Mayo. Your description of the Perlagkoniium Crimson King is by a very good one, but there are so many now in the same way that we can hardly venture to commend it as a novelty from a sight of a couple of trusses. You should show it at South Kensington.

PHALANOPSIS: R. T. A. The spots on your Phalanopsis are due to a young Collemoid Lichen, as is certain from the neck-like strings of gonimia; but how you "bodied forth" no one knows but what device. The sunk spots are a form of the well-known Orchid disease. We do not find a trace of fungi in them—nor, indeed, anything except empty cells, in which all the protoplasm has been absorbed. M. J. B.

PLANTS OF SHAKESPEARE: H. B. The articles in question appearing in the Garden, and have been republished in separate form by Rev. H. N. Elliott, compe, Bilton, near Bristol.

POSITIONS OF HOTHOUSES: H. Y. As a general rule houses for growing plants and fruits should have a southern exposure. For the earlier Grapes and Peaches lean-to houses are preferable; for later or middle crop span-roofed houses having the ends due north and south are much used. For Cucumbers and Melons low three-quarter span-roofed houses are preferred; but they will do in any form of structure. Camellias delight in a northern aspect. Give your stone walls a coating of cement 1 inch in thickness.

FRIMROSES: By an oversight we omitted to state in the report of the Articles last week that Mr. Brockbank, of Brockhurst, Didsbury, Manchester, received the 1st prize for Primroses.

RANUNCULUS: G. H. H. It is not at all an unusual fact for the double Ranunculus to produce green flowers.

RHUBARB: Fhilomela. The small red Rhubarb sent is very distinct from any other variety we know of, and very good in quality; likewise the larger seedling. You should send plants to the Royal Horticultural Society to compare with other sorts now being collected there.

ROSES AND SEWAGE: Enquirer. We cannot advise you to do as your gardener proposes—it would seriously cripple the Roses, if not kill them outright. Well dilute the liquid portion, and apply it after rain to the growing canes, or in sediments, you should put in a pit until it becomes sufficiently dry to use as top-dressing, or for mixing with other composts.

SHAMROCK: E. Tily. Medicago lupulina. Sometimes Trifolium repens is substituted.

FOREIGN SUBSCRIBERS sending Post-Office Orders are requested to make them payable to William Richards, at the post-office, King Street, Covent Garden, London, and at the same time to inform the Publisher at the office of this Journal.

CATALOGUES RECEIVED.

WILLIAM POTTEN, Sissinghurst, Staplehurst, Kent—General list. JAMES FLETCH & SONS, 544, King's Road, Chelsea—New Plants, and Soil-wedding and Bedding Plants. J. C. PARMAN, Boston Spa, Yorkshire—Bedding Plants.

Markets.

COVENT GARDEN, May 4.

Prices generally have been well maintained, with a steady business doing. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Fruit and Price. Includes Apples, Pigs, Gooseberries, Raspberries, Strawberries, Lemons, Peaches, Pine-apples, Chaelis, and Strawberries.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with 2 columns: Vegetable and Price. Includes Artichokes, Asparagus, Beans, Beet, Cabbages, Carrots, Cauliflowers, Celeriac, Cucumbers, Endive, Kail, Lettuce, Parsley, Peas, Potatoes, Radishes, Spinach, Tomatoes, Turnips, and Vegetables.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Flower and Price. Includes Abutilon, Anemone, Aralia, Arum, Azalea, Bouvardia, Camellias, Cineraria, Cyclamen, Datura, Eucharis, Gardenias, Heliotropes, Lappageria, Lilac, Lilies, Lilium, and Magnolia.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Plant and Price. Includes Aralia, Aucuba, Begonia, Calceolarias, Chelidonium, Cineraria, Cyclamen, Datura, Delphinium, Erica, Ficus, Geranium, Heliotropes, Impatiens, Lilies, Lilium, and Magnolia.

SEEDS.

LONDON: May 3.—The market to-day was thinly attended, and the transactions were unimportant. As regards values, there is no change of importance to be noted—the few small orders which come to hand being executed at late rates. Speaking generally, stocks of all kinds left over are in narrow compass. Good black Rape seed is in demand. There is a few inquiries for white Mustard, Canary and Hemp seed are dull and neglected. John Shaw & Sons, Seed Merchants, 37, Mark Lane, London, E.C.

HAY.

Tuesday's Whitechapel Market report states that with moderate supplies and a quiet trade prices were as follows: Prime Clover, 120s. to 135s.; inferior, 75s. to 90s.; best meadow hay, 100s. to 124s.; inferior, 55s. to 60s.; straw, 50s. to 56s. per load.—On Thursday a moderate supply was offered. There was a dull trade at late prices.—Cumberland Market quotations.—Superior meadow hay, 120s. to 132s.; inferior, 70s. to 82s.; Superior Clover, 128s. to 136s.; inferior, 90s. to 110s.; and straw, 52s. to 58s. per load.

POTATOS.

The Borough and Spitalfields Markets reports state that supplies keep pace with the demand, although arrivals are not as heavy as they have been. Fine samples sell steadily, but the trade otherwise is dull. Quotations.—Scotch Champions, 50s. to 60s.; Regents, 70s. to 80s.; Magnum Bonum, 85s. to 90s.; Victorias, 120s. to 130s.; Scotch Champions, 90s. to 70s.; Victoria, 120s.; flukes, 130s. per ton; German Reds, 4s. to 4s. 6d. per bag.—The arrivals in London last week consisted of 6664 bags from Hamburg, 735 from Malta, and 602 boxes from Lisbon.

COALS.

The prices current at market during the week were as follows:—Ravenworth West Hartley, 14s. 6d.; Walls End—Hawth, 16s. 6d.; Lambton, 16s.; Original Northrop, 16s. 6d.; West, 16s.; Hutton, 16s.; Hutton Lyons, 15s.; Tunstall, 15s.; Chilton Tees, 15s. 6d.; Tees, 16s. 6d.

Government Stock.

Consols closed on Tuesday at 101½ to 101½ for delivery, and 101½ to 101½ for the account. Wednesday's final quotations were 101½ to 101½ for delivery, and 101½ to 101½ for the account. On Tuesday prices declined ½ for delivery, and ½ for the account.

Primulas—Primulas—Primulas.

This month of May is the best time for sowing WILLIAMS' superb strain, 1s. 6d. per dozen, 10s. per 100. CINERARIAS same price. Package and carriage free. The above are quite equal to those I have sent out in previous years. Cash with order. JOHN STEVENS, The Nurseries, Coventry.

Rosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS

are made in materials of great durability. The plainest sorts are specially suited for KITCHEN GARDENS, as they harbour no Slugs or Insects, take up little room, and, once put down, incur no further labour or expense, as do "grooved" Edgings, consequently being much cheaper.

GARDEN VASES, FOUNTAINS, &c. in Artificial Stone, very durable and of superior finish, and in great variety of design.

F. ROSHER AND CO., Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kewland Road, E.

Agents for **LOOKER'S PATENT "ACME FRAMES,"** PLANT COVERS, and PROPAGATING BOXES; also for **FOXLEY'S PATENT EGGED GARDEN WALL BRICKS.**

Illustrated Price Lists free by Post. The Trade supplied.

ORNAMENTAL PAVING TILES,

for Conservatories, Halls, Corridors, Balconies, &c., from 32 per square yard upwards. Pattern Sheet of Plain or more elaborate Design, with Prices, sent for selection.

WHITE GLAZED TILES, for Lining Walls of Dairies, Larders, Kitchen Ranges, Baths, &c. Grooved and other Stable Paving of great durability, Wall Copings, Drain Pipes and Tiles of all kinds. Roofing Tiles in great variety, Slates, Cement, &c.

F. ROSHER AND CO., Brick and Tile Merchants. See Addresses above.

SILVER SAND,

5 fine or coarse grain as desired. Price, by post, per Ton or Truckload, on Wharf in London, or delivered direct from Pits to any Railway Stations. Samples of Sand free by post. **FLINTS and BRICK BURKS** for Rockeries or Ferneries. **KENT POTTERS or LOAM** supplied at lowest rates in any quantities.

F. ROSHER AND CO.—Addresses see above.

N.B.—Orders promptly executed by Rail or to Wharves. A liberal Discount to the Trade.

STOCK KEPT IN LONDON at Arch 92, Spitalfields Station, Bethnal Green, E., and Machines may be ordered from any respectable Ironmonger.

Ransomes, Head & Jefferies, ORWELL WORKS, IPSWICH.

THE "WORLD"

FOR CUTTING LONG GRASS.

Sizes, 8 to 22 1/2 lbs.

THE BEST GENERAL PURPOSE MACHINE.

The "AUTOMATON" Lawn Mowers are the strongest, well-made, and durable machines, and the best suited for general work and Gardeners' use. They cut the grass perfectly, leave no ribs, but produce a smooth velvet surface on the Lawn, and are light in draught.

The "AUTOMATONS" have front rollers for general work, and side rollers for cutting long grass, or when it is necessary to roll the grass in front of the cutters. They have the best machine made gearing, the best re-sharpening knives of steel and iron rolled together, and automatic sileat drivers.

R. H. & J. also manufacture "REVERSIBLE" Lawn Mowers for Small Gardens and Borders, and "HORSE-POWER" Lawn Mowers for Large Lawns, &c.

The "WORLD" will cut wet, dry, long, or short grass without clogging, and cut off almost all the "bents." They leave the surface smoother than similar machines, and are well adapted for getting over a large amount of work with little labour.

MELBOURNE EXHIBITION, 1881. THE HIGHEST AWARDED.

Good references.—A. D., 61, Biestod Road, Buckland, Portsmouth.

EPPS'S COCOA. GRATEFUL AND COMFORTING. James Epps and Co., Manufacturing Chemists, London. Makers of Epps's Chocolate for Afternoon use.

More Cures of Asthma and Coughs by DR. LOCKOCK'S PULMONIC WAFERS. Chest or Lungs, Cheshire.—In allaying any irritation of the chest or lungs, checking all disposition to coughing and promoting that inestimable boon, a comfortable night's refreshing sleep, they certainly stand unrivalled. J. H. EVANS, Druggist.

HOLLOWAY'S OINTMENT and PILLS. Rheumatism, Neuralgia.—It is sometimes difficult to determine which of these is afflicting the sufferer, but this ignorance will not matter if Holloway's remedies be used. They alleviate and cure all muscular, nervous and spasmodic pains. In hereditary Rheumatism, after bathing the affected parts with warm salt water, Holloway's Ointment should be rubbed upon the spot, that it may penetrate and exert its soothing and regulating properties on the deeper vessels and nerves which are unduly excited, and cause both the pain and swelling. Holloway's remedies possess the merit of removing the disease without debilitating the constitution, which was the inevitable result of the bleeding, mercury, and colchicum practice formerly adopted in these complaints.

SEND FOR A PRICE LIST OF

JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,

For Raising Water for the Supply of Towns, Villages, Irrigation, Railway Stations, Mansions, Fountains, Farms.

No cost for Motive-Power, which is obtained from the Stream of Water passing through the Rams.

NO OILING OR PACKING REQUIRED.

Made in sizes to raise from 300 to 500,000 Gallons per day. Will Force to a Height of 1500 feet.

Special Rams for High Falls to send up Two Gallons out of every Five Gallons passing through them.

APPLICATION OF BLAKE'S PATENT HYDRAULIC RAM B.

This Ram is worked by impure river water, whilst pumping pure water from a well and forcing it to a small reservoir on the hill, at an elevation of 295 feet, and a distance of 1 mile, from which reservoir the water is gravitated for fire extinguishing and general requirements of Mansion, Stables, Farm, and Village.

TESTIMONIALS.

From Mr. WILLIAM LAIT, County Surveyor, Conington, *Hampshire*, February 16, 1882.—"I have much pleasure in stating that the Patent Hydraulic Ram I had from you for the Rev. J. Cardwell-Gardner, of the Vicarage, Butlers Marston, is, I consider, remarkably successful, as indicated below. 4150 gallons of water per day are passing through the Ram with a descent of 12 feet 8 inches; one of this small quantity, 1080 gallons are sent up to a height of 41 feet; showing 78 per cent. of useful effect; and the noise of its working is so slight as to be almost inaudible.

From V. F. BENNET-STANFORD, Esq., M.P., *Pyt House, Tisbury, Wilt.*, August 29, 1880.—"I have no hesitation in saying your Self-acting Hydraulic Ram and Apparatus for Extinguishing Fire, which you laid down here, including about a mile of pipes, are very satisfactory. The Ram forces upwards of 5000 gallons per day to a service reservoir, holding 25,000 gallons at an elevation of 295 feet, being 70 feet above the roof of the house, from which reservoir the water is distributed to the house, stables, home farm, and several outcrops; and, in case of fire, four jets can be thrown on to the house from different sides at a great force and large volume. I consider the work has been done well and efficiently, and exceeds your credit."

From the Right Hon. the Earl of GRANARD, *Castle Forbes, Marick*, 1880.—"The Hydraulic Ram erected for me at Castle Forbes has answered perfectly. Considering the very small fall attainable by the nature of the ground, it is a great success, and throws up water to a cistern on the top of the tower 80 feet high. When Mr. Blake first proposed to put it up I doubted the possibility of its succeeding, owing to the nature of the ground; but I have been most agreeably undeceived."

From T. H. SHEBBOTTOM, Esq., *Etherow House, Hafield*, February 22, 1882.—"Induced by the good report of my cousin, Mr. T. A. Sidebottom, as to the working of the Hydraulic Ram he had from you, I ordered the one you fixed here a year ago, which I am pleased to say has since worked well night and day. Yet the two Rams you fixed at Snow's Hill Manor, Gloucestershire, for my brothers and myself, are I think a still more remarkable example of your success. We had a Ram fixed by a well-known firm, which proved a miserable failure, and which your Rams displaced. They are forcing the water through $\frac{3}{4}$ of a mile of delivery pipe, a little in excess of the quantity you guaranteed, to an elevation of 350 feet, and without the slightest hitch to the time of the last report from our tenant."

From the Right Hon. the Earl of ROSMERE, *56, Eaton Place, S.W.*, June 12, 1880.—"Sir.—In reply to your inquiry, I have pleasure in stating that the Hydraulic Ram which you erected for me at Gayton, does its work remarkably well, and is a great success. I think the work is especially creditable to you on account of the very small fall of but 3 feet with which you had to deal, and I shall always be glad to recommend you.—Yours faithfully, ROSMERE."

From Sir ROBERT MENZIES, Bart., of *Menzies, Rannoch Lodge, Rannoch*, August 20, 1880.—"The Hydraulic Ram you fixed for me to supply water to Rannoch Lodge and Camesswick's, two houses $\frac{1}{2}$ mile apart, is a complete success. The extreme distance the water is carried is $1\frac{1}{2}$ mile, and, though the elevations of the two houses are different, there is a regular supply of 4 quarts per minute to each house which has never ceased since the Ram was set a-going, about three months ago. Your Ram took the place of one previously tried on the same spot, and which did not succeed, and was in fact a complete failure."

From CHAS. C. CAHER, *The Cray Fisheries, Foot's Cray, Kent*, March 30, 1881.—"In reply to inquiry as to my opinion of the Patent Hydraulic Ram you fixed here, I may say that it has displaced two Rams by a reputed maker, which were so unsatisfactory that I put down a horse engine and pump, but this being a continual expense and trouble, I resolved to try your Ram, and am happy to say that my best hopes have been more than realised. The quantity of water sent up by the Ram is abundantly in excess of what I need to keep the Fisheries in perfect health, and this without any trouble."

From J. SPENDER CLAY, Esq., *Fort Manor, Linsfield, Surrey*, August 9, 1880.—"In reply to your letter of enquiry I am glad to be able to say that the two Hydraulic Rams which you fixed here are working satisfactorily, and that out of 13 gallons 3 quarts per minute, the maximum yield of the spring, they deliver to the top of my house, and at a full mile from the spring, 4 gallons 1 quart per minute, or 6120 gallons per twenty-four hours, being 120 gallons above the quantity you guaranteed."

From Captain GARDY, *Castle Bank, Appleby*, February 11, 1880.—"The Self-acting Hydraulic Ram you erected for me is an excellent example of strength and good workmanship. Whilst working with 3 feet 4 inches fall it forced water 73 feet high, and so far gives me every satisfaction. It will do more work in one day than the old Ram of another make could do in a week."

From Captain TOWNSEND, *Wincham, February 10, 1877*.—"In answer to your inquiry I am glad to say the Hydraulic Ram you sent me in November, 1875, is working exceedingly well, and gives no trouble. It will work when quite unattended, as it has been several times during the floods this winter, forcing up water through a delivery pipe 920 yards long at the rate of 85,000 gallons per day, although you only promised 50,000."

JOHN BLAKE, Engineer, ACCRINGTON, LANCASHIRE.

GRASS SEEDS

FOR LAWNS,

Of the finest close-growing Evergreen kinds, 12. per lb. Special
preparations for all purposes, soils, and situations. Advice gratis.

Unsolicited Testimonials:—

"Knowing how difficult it is to obtain pure stocks of grass
seeds, even when price is a secondary consideration, I write to
say the supply I obtained from you for our new terrace lawns
has given the greatest satisfaction.

"Please send me three bushels of the very best Lawn Grass
seeds, suitable for an exceedingly hot upland soil. The
seed I have had of you has been the only kind which has
been able to resist the influence of the sun and drought upon
my th, gravelly soil."

FARM SEEDS

Of all kinds, which have given unqualified satisfaction. See
Illustrated and Descriptive LIST, free on application.

RICHARD SMITH & CO.,

W. AND J. BIRKENHEAD, Fern Nursery, Sale, near
Manchester.

ORCHIDS.

The Largest and Best Stock in Europe of
good Established Plants.

Tens of Thousands of Plants to select from.

MR. WILLIAM BULL

Pleas to intimate that his Orchid-houses are always
quite a sight, from the large number of plants in flower,
and he will be pleased to show them to any one inter-
ested in this beautiful class.

MR. WILLIAM BULL

Recommends those desirous of having their Houses
gay with Orchid flowers, to purchase good established
well-cultivated plants, which bloom well, are far more
satisfactory, and comparatively cheaper than newly
imported or semi-established plants.

Establishment for New and Rare Plants,
536, KING'S ROAD, CHELSEA, LONDON, S.W.

LIST of Carpet and General Bedding Plants gratis. **W. MILLS**, West Brighton Nurseries, Hove, Sussex.

New Colors 'Crimson Velvet.'

EDWIN COOLING has much pleasure in presenting attention to the above selected variety. The colour of the leaf is bright crimson, veined with darker crimson, and remarkably rich and velvety in appearance. The habit is very free and compact. As a pot plant for the decoration of the greenhouse it is unequalled, and in warm situations will take a high rank as a bedding plant. Strong plants now ready, 3s. 6d. each. A specimen leaf will be sent to any address on receipt of a stamped and directed envelope.

EDWIN COOLING, Mile-End Nurseries, Derby.

ORCHIDS A SPECIALITY.

HUGH LOW & CO.

HAVE ON HAND, IN EXCELLENT CONDITION, MANY THOUSANDS OF

PHALÆNOPSIS

AND

ODONTOGLOSSUM ALEXANDRÆ (CRISPUM).

Amongst the plants are many of unusual size and very varied in appearance, giving promise of good varieties. The stock of these lovely Orchids is, without any exception, the largest hitherto seen in Europe, and the same remark applies to the General Collection of Orchids, which is of such magnitude that, without seeing it, it is not easy to form an adequate conception of its unprecedented extent.

HUGH LOW and CO. very cordially and respectfully solicit an inspection by all lovers of this interesting and beautiful class of plants, whether purchasers or not.

THE LIVERPOOL HORTICULTURAL COMPANY

(JOHN COWAN), Limited,

The Vineyard, Garston, near Liverpool

The Company having recently made large and successful importations of Orchids from India, beg to offer Twelve DENDROBIUMS, in pots and baskets, just starting into growth, including package, for 42s., as follows:—Dalhousianum, Parishii, Heterocarpum, Falconeri, Wardianum, Chrysanthum, Formosum, Devonianum, Thyrsliflorum, Primulinum, Calceolum, Crassinode.

The Company offer the following specialities:—

TEA ROSES—Twelve finest varieties, package included, for 12s., 18s., or 24s.

PELARGONIUMS—Twelve finest varieties coming into flower, package included, for 12s., 18s., or 24s.

FLOWERING PLANTS—Twelve finest varieties, for GREENHOUSE Decoration, for 12s., 18s., or 24s., package included.

The Company have a fine general stock of STOVE, GREENHOUSE, and ORNAMENTAL FOLIAGE PLANTS.

The Company beg to announce that their young VINES, from eyes *this season*, are now in fine condition for planting Vineries, and also that they have still on hand a few good Canes of most varieties suitable for fruiting in pots and planting Vineries.

The Company beg to call special attention to Thomson's Vine and Plant Manure, which is manufactured by them, and is the Manure used for producing the splendid Grapes grown at Clovenfords.

Though this Manure has only been offered to the public during the past four months, the Company are already receiving the strongest testimonials in its favour from those who have used it, and its grand effects are at once apparent to all who see the Vines and Plants in the Vineyard and Nurseries here.

Price. Bags of 1 cwt., 20s.; $\frac{1}{2}$ cwt., 10s. 6d.; $\frac{1}{4}$ cwt., 6s.; $\frac{1}{8}$ cwt., 3s. 6d. Tins of 7 lbs., 2s. 6d.; $\frac{1}{2}$ lb., 1s.

To be had of all Nurserymen and Seedsmen.

HORTICULTURAL BUILDINGS of all kinds erected and heated in the best manner and at moderate cost.

All Letters to be addressed to

THE MANAGER,
THE VINEYARD and NURSERIES,
GARSTON, near LIVERPOOL.

EXHIBITION OF ORCHIDS.

B. S. WILLIAMS

has much pleasure in announcing that he has determined to make a grand show of his flowering ORCHIDS, during the next two months, at home. The Exhibition will include, in addition to the usual stock of young Flowering Plants, all the grand specimens that he has been in the habit of including in his Collections, which have obtained the leading prizes for many years both at home and abroad.

Patrons of Horticulture are especially invited to inspect this Exhibition.

The Exhibition will contain large and small specimens of ODONTOGLOSSUMS, CATTLEYAS, LÆLIAS, ONCIDIUMS, CYPRIPEDIUMS, MASDEVALLIAS, VANDAS AERIDES, SACCOLABIUMS, and other rare and showy ORCHIDS.

**AN EARLY INSPECTION IS RESPECTFULLY INVITED.
NO CARDS TO VIEW REQUIRED.**

A hearty welcome will be given to all who honour us with a visit.

CARRIAGE ROUTE.

Carriage Route from the West End is through Albany Street, Regent's Park, Park Street, Camden Town, Kentish Town, and Junction Road.

The North Metropolitan Tramway Cars, in addition to the Street Tramways Company's Cars, arrive at and start from the Nurseries, for the City and West End, every few minutes.

The Great Northern Main Line trains all stop at Holloway Station, which is within fifteen minutes' walk of the Nurseries. The Midland and Great Eastern Main Line trains all stop at Kentish Town Station, which is within ten minutes' walk of the Nurseries. The Midland, in connection with the Metropolitan Railway, runs frequent Trains during the day from all parts of London to Upper Holloway Station, which is within three minutes' walk of the Nurseries.

VICTORIA AND PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.

THOMAS S. WARE, HALE FARM NURSERIES, TOTTENHAM, LONDON.

Commencement of the Sixth Volume. *THE JOURNAL OF*

FORESTRY AND ESTATE MANAGEMENT.

Monthly, One Shilling. Post-free, 12s. per annum.

The Editor has the pleasure to announce that for the new volume the sixth, which commences with the May part (now ready), he has been able to arrange for such a number of interesting and valuable articles on the various branches of arboriculture and the management of estates, by well-known practical writers, as will effectually uphold this Journal in the high position which it has now obtained as a practical guide for landowners and country gentlemen.

Increased attention will also be devoted in the forthcoming volume to descriptions of sylvan scenery, pleasantly written and beautifully illustrated, sketches of remarkable trees, visits to celebrated woodlands, tree-lore and facts and fictions of the forests, and other pleasant reading for lovers of trees, which has done so much during the past year to popularise the Magazine.

The following is an abridged List of the Contents of the May part:

Curious and Historic Trees (Illustrated).	The Teaching of Forestry.	Woods and their Management.	Queen Mary's Tree.
Thinning and Pruning Forest Trees.	The Australian Bug.	An Australian Mammoth Tree.	Beech versus Horbeam Hedges.
Beauty of Forest Trees.	Ravages of the Pine Saw-fly.	The Fine Tree of Alliaz.	Editorial Notes—Reviews—Chips and Higs, &c.
	Wild Flowers in Hants.		
	Profitable Planting.		

WILLIAM RIDER & SON, 14, Bartholomew Close, E.C.

WM. CLIBRAN AND SON'S ZONAL GERANIUMS, see Catalogue. Double and Single, Ivy-leaf, Scented, Bicolor or Tricolor Varieties, for Beds or Pots, Winter or Summer Blooming, 12 varieties 4s., 25 do. 7s. 6d., 50 do. 12s., 100 do. 20s. Cuttings half price.

WM. CLIBRAN AND SON'S DAHLIAS, see Catalogue, varieties 3s., 25 do. 5s. 6d., 50 do. 10s. 6d., 100 do. 21s., 100 in 50 varieties 16s. Cuttings half price.

SINGLE DAHLIAS—See Catalogue for list of sorts and price.

WM. CLIBRAN AND SON'S Cheap BEDDING PLANTS, from stores for potting—Ageratum and Lobelia in variety, to name, our selection, per dozen, 9s.; per 100, 4s.

CALCEOLARIAS—Golden Gem and Aurora-floribunda, per doz., 1s.; per 100, 5s.; per 1000, 40s.; Prince of Orange, per 100, 5s. **RESINES**, of sorts—Mesembryanthemum variegatum, per dozen, 1s. 6d.; per 100, 10s. For other Bedding Plants, in great variety, see Catalogue. Cuttings half price.

WM. CLIBRAN AND SON'S **AMULIONS, COLEUS, Evergreen PEGONIAS, MINULUS, SALVIA, LANIARAS, TROPÆOLUMS,** 12 varieties of any of these (our selection) 3s., 6 each of the seven, 4s. plants, for 9s.; Heliotrope, 12 varieties, 2s. 6d. Cuttings half price.

WM. CLIBRAN AND SON'S Cheap STOVE and GREENHOUSE PLANTS, either Stove or Greenhouse, or both as desired, our selection, all fine varieties, 12 for 6s., 25 for 12s., 50 for 22s. 6d., 100 for 42s. **ORNAMENTAL FOLIAGE BEGONIAS,** 6 varieties 3s., 12 do. 6s.

WM. CLIBRAN AND SON'S **CYCLAMEN and Spotted CALCEOLARIAS,** the finest of strains. Cyclamen, fine young bulbs, 2s. 6d., 3s. 6d. and 4s. 6d. per dozen. Spotted Calceolaria, 2s. 6d., 4s., 5s. per dozen.

WM. CLIBRAN AND SON'S STOVE, GREENHOUSE and HARDY FERNS, any or all classes as desired, 12 varieties, 6s.; 25 do., 12s. 6d.; 50 plants, in 20 sorts, 21s.

WM. CLIBRAN AND SON'S HERIACEOUS PLANTS. The finest and most showy kinds, true to name, 12 varieties, 3s. or 5s.; 25 do., 5s. 6d. or 9s. 6d.; 50 do., 10s. 6d. or 18s.; 100 do., 20s. or 35s.; 100 plants, in 50 varieties, 16s. or 30s.

WM. CLIBRAN AND SON'S FLORISTS FLOWERS, see Catalogue. For Exhibition or Garden Decoration, all to name, our selection—Carnations and Picoetes, 12 plants 6s., 12 pairs 9s. 6d.; Pyrethrums, Delphiniums, and Peonies, 8s. per dozen, 12 of each for 22s. 6d.; Potentillas, 5s. per dozen; Fancies, Show or Fancy, Piloeses, Pinks, Sweet Violets, 3s. per dozen; 12 of each, 60 plants, 13s.

WM. CLIBRAN AND SON'S CHEAP HARDY BORDER FLOWERS, strong Plants for immediate effect. Polyanthus, Single Primroses, Sweet William, Wallflowers, Canterbury Bells, Forget-me-nots, Silene conopsea, Arabis, Aubretia, Dianthus, Anemones, Scabious, any of these, 2s. per dozen, 4s. per 100; smaller plants, 9d. per dozen, 3s. per 100.

WM. CLIBRAN AND SON'S VIOLAS and BEDDING PANSIES. Many thousands of plants from the open ground, fine sorts, to name, 12 varieties, 2s. 6d.; 25 do., 5s.; 50 do., 10s.; 100 plants, 18s.; Yellow, White, or Purple, or Mixed, as desired, 30s. Pansies, Red or Pink, 12 per dozen, 4s. per 100; Auraria Seedlings, 1s. 6d. per dozen, 10s. per 100; Gladstone Frenchcrysanthemum, 12 per dozen, 7s. per 100; Lilium, 12 distinct kinds, for 20s., 6s.

HARDY CLIMBERS in pots, in great variety, 12 distinct varieties 9s.

STRAWBERRY PLANTS, from ground, our selection, 2s. 6d. per 100, 5s. in 100; 100 plants required, 12s.; strong plants from 2½-in pots 10s. per 100, from 5-in pots 21s. per 100.

For full particulars of all the above and Seeds, see Catalogues.

WM. CLIBRAN & SON,
THE OLDFIELD NURSERIES,
ALTRINCHAM.

8 miles from Manchester. Over 50 trains daily.
Inspection invited.

THURSDAY NEXT, MAY 18.

PHALÆNOPSIS AMABILIS.

MR. J. C. STEVENS has received instructions from **Mr. F. SANDER,** St. Albans, to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, May 18, at half-past 12 o'Clock precisely,

SOME THOUSANDS OF THE ABOVE PHALÆNOPSIS.

The plants are in splendid condition.

Also a grand lot of **VANDA LAMELLATA BOXALLI, AERIDES QUINQUEVULNERUM, DENDROBIUM SUPERBUM GIGANTEUM, SACCOLABIUM VIOLACEUM** and many other species of ORCHIDS.

On view morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN,
LONDON, W.C.

THURSDAY, MAY 25.

PHALÆNOPSIS SCHILLERIANA.

CATTLEYA SKINNERI

(COLLECTED IN FLOWER.)

MR. J. C. STEVENS has received instructions from **Mr. F. SANDER,** St. Albans, to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, May 25, at half-past 12 o'Clock precisely,

Very extensive Importations of the above, consisting of several thousands of plants.

On view the morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN,
LONDON, W.C.

DENDROBIUM BRYMERIANUM, D. FINDLEYANUM, PHALÆNOPSIS AMABILIS, SCHILLERIANA, VIOLACEA.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, on WEDNESDAY, May 17, at half-past 12 o'Clock precisely, by order of Messrs. HUGH LOW & Co., a large quantity of imported ORCHIDS, consisting of a grand lot of **VANDA CÆRULESCENS, DENDROBIUMS,** twenty species, including **D. BRYMERIANUM, D. BONALLI, D. FINDLEYANUM, D. CRYSSTALLINUM, D. CRASSINODE, D. WARDIANUM, D. DEVONIANUM, D. CAMBRIDGEANUM; CATTLEYA AMETHYSTOGLOSSA,** many hundreds; **PHALÆNOPSIS AMABILIS** and **SCHILLERIANA,** many hundreds; established, also semi-established plants of **PHALÆNOPSIS VIOLACEA** and **TIGRINA (SUMATRANA),** varieties, and other choice ORCHIDS.

On view morning of Sale, and Catalogues had.

AUCTION ROOMS AND OFFICES, 38, KING STREET, COVENT GARDEN
LONDON, W.C.

NEW DOUBLE CINERARIAS.

R. H. VERTEGANS

now booking orders (delivery in the autumn) for his unrivalled Collection of twelve superb and distinct varieties: the set of twelve for 30s.; Single Plant, 3s. 6d. Descriptive LIST on application. Seed (saved from the above) 3s. 6d. and 5s. per Packet. If sown now, will flower in December.

LAPAGERIA ALBA.

This splendid Cool Greenhouse Climber—pure wax-like Flowers, and a profuse bloomer—Plants well-established in pots, from 10s. 6d. to 63s. each.

Price Per Dozen to the Trade on Application.

THE QUEEN'S SEEDSMEN { Seedsman by Royal Command to } H.R.H. THE PRINCE OF WALES
237 High Holborn, London, W.C.

DENDROBIUM FORMOSUM GIGANTEUM.

HEATH AND SON

Beg to announce the arrival of an immense importation of the above, from the same locality in Upper Burmah as those last year, which gave such enormous flowers, many measuring 6 inches in diameter.

The "GARDENERS' CHRONICLE" of October 1, 1881, says:—"From Heath & Son of the College Road Nurseries, Cheltenham, we have been favoured with a bloom of this noble Orchid, measuring 5 3/4 inches across, from a new district in Northern Burmah. The lip is 2 inches broad and the yellow blotch very bright."

The plants from this locality flower twice a year—in the autumn from the new growths, and in the spring from the old, with two to four spikes and from two to five flowers on a spike. The bulbs are very large and many measure 3 feet long.

Small plants, one and two breaks .. 60s. per dozen. | Small plants, three and four breaks .. 84s. per dozen.
Few specimens and large masses .. 21s. to 63s. each.

SACCOLABIUM GUTTATUM AND BLUMI MAJUS.

Nice Plants, 60s. per dozen; stronger, 8 to 10 leaves, 10s. 6d. each; very strong masses, 6 to 8 breaks, 42s. each.	
DENDROBIUM HEDYOSMUM, 5s. each.	AERIDES ODORATUM—the plants we imported last year are very
" FYTCHIANUM, 60s. per dozen.	high coloured, being now flowered, 42s. and 60s. per dozen.
" CUMULATUM, 60s. "	VANDA TERES—breaking well, the majority coming into flower,
" CHRYSOTONUM, 42s. and 60s. per dozen.	7s. 6d. each, 60s. per dozen.

HEATH & SON, EXOTIC NURSERIES, CHELTENHAM.

SEEDLING ROSES.

H. BENNETT (LATE OF STAPLEFORD, WILTS),

Will distribute, the first week in June next, strong Pot Plants of Roses of his own raising:—

PRINCESS OF WALES (Tea).	LADY MARY FITZWILLIAM (Hybrid Tea).
COUNTESS OF PEMBROKE (Hybrid Tea).	EARL OF PEMBROKE (Hybrid Perpetual).
DISTINCTION (Hybrid Tea).	HEINRICH SCHULTHEIS (Hybrid Perpetual).

Descriptive PRICED LIST Post-free on application.

Intending Purchasers should order at once, as the stock is very limited, two-thirds having been already booked.

per 100.

Orchids.

THE ODONTOGLOSSUM-HOUSE at
Mr. WILLIAM BULL'S Establishment is now a
charming sight, probably unequalled. An inspection is invited.

Double White Bouvardia, Alfred Neuner.
Mr. WILLIAM BULL can now supply
this pretty and desirable novelty by the dozen or 100, at
1s., 1s. 6d., and 2s. 6d. each.

New Double Pink Bouvardia.
MR. WILLIAM BULL is now booking
orders for this pretty Novelty at 1s. 6d. each.
Date of issue will be announced in future Advertisements.

Exhibition of Orchids.
MR. WILLIAM BULL'S Exhibition will
be open on MONDAY, May 22, to those having received
invitations, and to patrons of the establishment.

Establishment for New and Rare Plants,
536, King's Road, Chelsea London, S.W.

THE
Gardeners' Chronicle.

SATURDAY, MAY 13, 1882.

THE GALE.

THE gale that swept over the greater portion of the kingdom on April 29 has left its traces on the vegetation in a manner more impressive than agreeable. To say nothing of the damage done to the fruit trees, the showers of blossoms and embryo fruits scattered broadcast, the effects of which we shall feel more directly by-and-by, we are, for the moment, more concerned with the injuries inflicted on the deciduous trees. Just as they were bourgeoning forth in all the delicate beauty characteristic of the English spring their beauty has at one fell swoop been destroyed by one of those capricious accidents no less, we regret to say, characteristic of the season. But, however great our dismay and disappointment, we are at least supplied with some sources of interest in the examination of the different effects produced on different trees by the gale in question. Speaking broadly, those effects are due either to laceration of the tissues of the leaf or to bruising of their substance, or to both. It is an open question whether the rapid lowering of the temperature may not have produced the same effects as would have resulted from the action of severe frost—whether, in fact, the living tissues of the leaves were not for the time better indicators of the severity of the destroying agent than the thermometer itself.

Again, in some places, no doubt, saline particles borne inland from the surface of the sea may have had their part in the general havoc. In truth, many of the specimens forwarded to us have exactly the appearance of the foliage of deciduous trees directly exposed to the briny blast. But to whatever extent this may be true, in regard to trees at a comparatively small distance from the sea and in the direct line from that source of mischief, it certainly does not apply to trees at a greater distance inland. In the latter case only the causes we have mentioned are adequate to the observed effect. In some cases, as in some of the broad-leaved Maples, the leaves have been simply cut into ribbons by the force of the gale and by the violent friction of the leaf and branch. In these cases the leaves are cut into fragments, leaving little but the fibrous portions of the leaves intact, and the small portions of the cellular substance are, or were, at first, left comparatively without discoloration. In other cases the whole tissue of the leaf is discolored and reduced to pulp, almost as if it had been parboiled or subjected to the action of strong acid. Sometimes this bruising and pulping affects the whole or the greater part of the leaf, at other times it is confined to the tips or the margins, and when this is the case the check to growth at the margins, while the central portions or disc of the leaf have been unaffected, has caused a remarkable effect in the raising of the centre of the leaf in a convex (dome-like) manner, the growing portions being, as it were, tied down by the bridle of dead tissue along the margins. The cell walls have been burst, and the protoplasmic contents bruised and turned brown, as is so generally the case when this essential part of the organism is in any way injured.

Botanists and anatomists are familiar with the different ways in which leaves grow, the chief activity of growth being in some species manifested chiefly or entirely in one region of the leaf, in other species at another. Under ordinary circumstances, these phenomena are not obvious, except to the microscopist; they do not jump into the eye, as the French proverb says; they are not visible to the untrained or unaided vision; but if any ordinary observer will now examine a sufficient variety of trees that have suffered from this rude blast, he will have no difficulty in seeing with the unaided eye where growth has been going on most actively, and where, in consequence, the injury has been most felt. In the Horse Chestnut, for instance, it is clear that while the tips and the margins have been irretrievably damaged, the injury, as shown by the browning of the tissues, has also proceeded in directions parallel to the direction of the main nerves of the leaf, and suggesting the inquiry whether the conducting and sheathing-cells which encircle the vascular bundles have not been especially damaged.

While this is a matter for the patient microscopist to determine there are other points more within the scope of the practical gardener, such as the observation of which trees undergo conditions of exposure have been least affected, and, again, which trees of the same species are latest in their development; for it is abundantly clear that, among individuals of the self-same species, some are much more precocious than others, and these would of course be the first to suffer—while others, whose course of development is more tardy, would be the more likely to escape the effects of such visitations. It will also be a matter of much practical import to watch the course of events in these trees in the coming summer, to see which have recuperative power and in what degree, and thus estimate the real amount of the damage inflicted, not only for the moment, but for the coming season. By observations of this kind a disaster may be turned to good use; and, although we may not be able to retrieve the damage, we may yet gain such information as shall be of service in various ways in the future.

New Garden Plants.

MASDEVALLIA ROSEA, Lindl.

(See *Rebh. l.* in *Gard. Chron.* 1880, May 1, p. 554, and May 22, p. 645; *Gard. Chron.* 1880, May 29, p. 680, 681, two woodcuts, and a note p. 681.)

IT flowers! It was sent me from Sir Trevor Lawrence's garden on April 29, twenty-three months after the sale. Mr. O'Brien, of Maiden Vale, sent flowers on May 3, grown by Mr. R. P. Percival, Clevedon, Birkdale, Southport. Mr. Percival's plants have so many flowers, that these are most obligingly offered to me *in dissection*. Herr Hofgatterer, Kiehof, of Donauwörthingen in Baden, the skilful and enthusiastic gardener to Prince Furstenberg, long since told me that he would send me flowers when open. Finally, the last number of the *Gardeners' Chronicle* informs us that M. D. Massange de Louvres, Bailleville près Marche, Belgium, has this rare and beautiful species in flower.

No doubt the plant will flower at other places and it would be useful if the successful growers, who share the great honour of having had the plant in good condition, would tell us how they managed to bring it to perfection. If we compare the flowers with the wild ones there is no doubt they will improve a good deal, the best ones at hand not being more than two-thirds the size of the native Andine specimens. Knowing the immense difficulty of bringing this plant through the hot regions, the great trouble my friend F. C. Lehmann had taken in carrying out his plan, when other excellent collectors had simply given way to despair, I hoped in May, 1880, to see the traveller well repaid. This was not the case. After all the efforts I had made, and for which I now see myself justified, there came, two days before the sale, the remark, "Suffice it to say that it resembles a rose-

coloured *M. Harryana*." Those few words have decidedly cost Mr. F. C. Lehmann more than a hundred guineas, for no doubt very few amateurs felt disposed to pay a high price for a plant that was only like a rose-coloured *Masdevallia Harryana*, and the more so as the importation could not be in the strongest health. Then came one of the most celebrated Orchid growers, who said he believed the plant was not to be grown, and the *etches* was decided.

I remember that when Mr. Williams first brought his glorious North Australian *Dendrobes* to Mr. Stevens the word passed round that they were altogether rubbish. I also remember that Mr. James Veitch told me that having as a beginner succeeded in introducing a very fine *Tropæolum*, the whole thing was spoiled by the operation of a "friend," who declared that it was not very fine, and that he could grow it much cheaper: finally both *Tropæola* proved quite distinct, but Mr. James Veitch had irreparably lost the advantage he had hoped to gain. A similar accident was endured with a *Tropæolum* at Berlin, by Professor Karsten. Many such cases could be quoted, where the traveller, after all the risks he has incurred, has seen his well-grounded hopes destroyed by the detractors.

I believe that this is the reason of the opinion of many, that it pays far better to bring old than new plants. I am afraid, if more experiences of this kind occur, collectors will prefer to take their novelties first to New York. The demand there is far less than in Europe, but much higher prices are paid.

The best flower at hand reaches in greatest length $7\frac{1}{2}$ centimetres. The short ovary itself is light greenish in Sir Trevor Lawrence's flowers, dark blackish in those of Mr. Percival, fine green in Mr. F. C. Lehmann's picture.

The botanical characters of the plants are that the compressed tube is equal to the free limb of the sepals, and that the peduncles are so short that the flowers do not stand much above the leaves. Hence it is a totally fresh type, not comparable with *Masdevallia Harryana*. The limb is exceeding unequal. The side sepals broad obtuse-angled, with short tails, and the odd sepal may merely be said to be nothing but a tail, there being only a very short triangular base. There is a white blotch at the base of the tube over the ovary and some orange at the sides. The tube itself is of deep crimson-purple on the side of the odd sepal, and of the finest rose-lilac on its other parts outside. The lateral sepals have the short tails of crimson-purple colour, but their blades have inside a light hue of mauve-rose: this, at least, is the impression on my eye, and for me nearly the most charming quality of the plant.

It is quite curious how small the inner parts of the flower are. The ligulate petals, with a blunt apex and a little point on it, are unusually hastate at the base. The lip is nearly heart-shaped at the base, recurved and oblong ligulate, ciliate at the border, from numerous small stiff acute papillæ, and with a dark blackish-purple cushion from numerous long papillæ at the top. There are some small purple spots on it, and the sides at the base are ochre-coloured. The anther has two falcate anterior processes, which nearly embrace the tail-like square rostellum. The column and petals are white. *H. G. Rehb. f.*

CATASETUM CHRISTYANUM (*Rehb. f.*) CHLOROIS.

Take *Catasetum* into your stove, and you are pretty sure to become more or less bewitched, earlier or later. This is actually the case with Mr. H. Christy. With him another plant has produced its flowers, and in lieu of being equal to the first plant's flowers they have frog-green sepals and petals, all standing together, and a dark green, much smaller flanged lip with an immense spur, whose mouth has a callous border, the superior not quite so much developed as in the first plant, the anterior one reddish. The outline is pentagonal. This forms a transition to some of the smaller *Myanthoid* sexes. *H. G. Rehb. f.*

PHALANOPSIS SUMATRANA (*Rehb. f.*) PAUCI-VITATA.

Messrs. Veitch appear to have a large quantity of these plants. A variety we hope to see a second time flowered in June last year at the same time as the lovely gem *Phalanopsis maculata*. Now comes a genuine *sumatrana* of peculiar features. It has very fleshy leaves, and the flowers have on the usual ground of milk colour a few cinnamon-purple bars—three or four. The stripes on the lip are very fine mauve. *H. G. Rehb. f.*

RHODODENDRON HOOKERI.

Among the less known species of *Rhododendron* lately shown by Mr. Mangles at the Scientific Committee of the Royal Horticultural Society, has been the species above named (fig. 96). Its general character is shown in the illustration, wherein the peculiar arrangement of the scales in scattered tufts along the nerves on the under-surface of the leaves, and nowhere else, is shown. The flowers have something of the blood-red colour of those of *R. Thomsoni*. Mr. Mangles' specimen came, we believe, from the garden of our excellent correspondent, Mr. Anderson Henry. The species was first discovered in Bootan by Booth, and described by Nuttall in Sir W. Hooker's *Journal of Botany*, vol. v. (*Gard. Chron.* 1858, p. 129). In its native country it is described as a shrub 12 to 14 feet in height, forming thickets on the mountain sides at an elevation of 8000—9000 feet, where in the winter season it is exposed to severe and continuous frost and snow. The plants associated with it more particularly are *Pinus excelsa* and *Rhododendron eximium*.

AMONG THE HARDY PLANTS.

ON my return from a short but most enjoyable run with my son among some hardy plant gardens, I cannot resist the pleasure of sending you a few notes on what we saw. I was anxious that my son—who I hope will carry on my gardening work when I am gone—should see some of the celebrated gardens where hardy plants are grown with success, and should be introduced to their owners. A business engagement taking me to Cheshire we began there, and having some spare time went to the nursery of Messrs. James Dickson & Sons, of Chester, in quest of the double *Primroses* which have been noticed in the gardening papers. The rain was too heavy (it was the stormy Saturday) to allow us to go round the garden, but there were many interesting plants in the houses, among them a number of hardy Bamboos from Japan, new to me, and likely to be attractive hereafter in shrubby borders. Mr. Shortt, the able and much-travelled foreman of hardy plants, gave me the benefit of an hour's chat over plants not easy to grow, and I at least got some valuable hints.

From Chester we proceeded to Edge Hall, Malpas, pronounced "Morpus" by the natives. The notes of the proprietor, the Rev. C. Wolley Dod, in the gardening papers, especially those on rockwork, had prepared me for an interesting garden, but much more had been done than seemed possible in the time. When a powerful mind, trained in habits of accuracy and observation, in full vigour, with leisure and means, brings its full force to bear on such objects as hardy plant collection, cultivation, and arrangement, great results may be expected; at Edge Hall they have certainly been achieved. I cannot attempt to name all or even a selection of the plants here got together. One important feature is that Mr. Dod has collected many interesting native plants and grown them so as to show them in their proper character and full beauty. There is a very great deal of rockwork, the stone for which has been carefully studied and selected; some is set apart for small and difficult alpine, where every chance is given them, but in large nearer the drive, and therefore more in view, rich flowering masses are allowed to luxuriate over the great stones with a beautiful effect. On one border there is a plant I could appreciate, having lately been working upon it—*Gentiana verna*; a patch not as large as a hand was simply all blue, with more than a hundred flowers expanded. The plants I most wished to see were of a family I have especially studied. Mr. Dod had told me of his *Lilium pardalinum*, in height and number of flowers much finer than I had ever succeeded in growing in the open border; there they were, more than justifying his description, their huge heads not much above the soil, but high enough to tell unmistakably what they would be; the soil is practically what I have been recommending for many years, and the situation as to shelter little different from ours. Whether the climate, cooler and moister than ours, is the cause of the stronger growth, remains to be proved, and shall be, if I can do it.

Several reflections force themselves upon one in a garden like this. Friends often say, "What an amusement your garden must be to you!" Amusement it is, and a very delightful one, but they never think of the amount of thought and hard work it

takes to make grow and keep up a large collection of hardy plants, especially alpinists. Then as death makes gaps in the ranks of our fraternity and we lose enthusiastic gardeners like Mr. Joad, and more recently like that great gardener, the Rev. J. G. Nelson, of Aldborough, it is pleasant to think that newer men come up to fill their places. And then how impossible it is for nurserymen to compete with amateurs in many plants, unless, indeed, like Mr. Backhouse, or the late Mr. James Veitch, they have places of their own which are kept sacred otherwise—specimens have to be sold or broken up.

Then how well it is that there are workers upon the same plants under different conditions of soil and climate in many parts of the country; plants easy to grow in one place are often difficult to cultivate in another,

had left their mark in places, but few gardens can bear losses better than Bitton, with its wealth of interesting plants, such as hardly any, if any, garden in the country possesses, and certainly no one can be a more charming guide round than the owner. Our next resting place was Clifton Down, with my kind old friend, Mr. Saunders. Sutton House garden is of a different school from the others we had seen, but perfectly suited to its situation; herbaceous plants and bulbs are not neglected. I have never seen *Pentstemon* or *Trifolium aureum* finer than in his side beds, but the strength of the front garden is in its bedding plants; these are perfectly selected and arranged, and filled in so as to keep up a constant most beautiful display. In the numerous plant houses he is very successful with *Orchids*; there

observer, so the flower was a great puzzle. At both of these gardens were many wonderful Ferns, some raised by Col. Jones had almost the character and soft beauty of *Todea superba*. The Clifton Zoo has benefited by his labours, as he has planted instructive beds each with the different varieties of the same species of Fern as a background for *Frimroses* of different colours, but each colour kept distinct. On our way home we stopped at Reading and looked over Messrs. Sutton's nursery; there were not many of the plants in which I am most interested, but the houses well repaid the visit, the perfect way in which they are kept and the many clever contrivances pointed out by our intelligent guide, the seed saving arrangements, the accurate pedigrees, and last, but not least, a house full of *Calceolarias* beautifully grown, and some with richer colours than I ever re-

FIG. 96.—RHODODENDRON HOOKERI: FLOWERS DULL CRIMSON. (SEE P. 628.)

but seeing them under the different circumstances teaches the best mode of cultivation.

From Malpas we proceeded through a beautiful country to Bitton; I had not seen Canon Ellacombe's garden for some years, though "Bitton" on labels often told of valued past benefactions; it was a great pleasure to be again in a place which has had no dark ages—some sixty years of continuous hardy plant growing without a break. It is, as is well known, a wonderful garden; you come upon treasures in all sorts of places. It is quite different from Mr. Dod's, where "order reigns supreme," but the plants seem to like being left a good deal to themselves, and certainly look most happy. *Choisya ternata* on a wall, a fine large plant covered with white blossoms, filled the air with the sweet orange scent, and a *Eurybia*, with its white star flowers, a smaller though fine plant, was scarcely less sweet. The late hard winters

is a good collection of *Cypripediums*, beautiful varieties of *Masdevallias*, and many other species in bloom. In the mixed house Sikkim *Rhododendrons* were in perfection, the garden anywhere near their windows being scented by them. While with Mr. Saunders, Col. Jones, the great Fern authority of the district, took me to his aid to Mr. Fox's garden; a friend of his who accompanied us, and who seemed to know many plants and was a considerable traveller, told me of a *Lilium longiflorum* he had seen in Bermuda with seventy-two flowers on one stem. I pointed out how utterly out of character this was with *L. longiflorum* as we know it, but could not shake him; he said he knew *L. longiflorum* before he went out. Can any of your readers suggest any plant likely to grow in Bermuda with the flowers of the character of *L. longiflorum*. He hoped to find a photograph of the plant; as far as I could see he was an accurate

member to have seen before, were well worth seeing. Here our pleasant week's run ended.

While looking over the gardens we visited I naturally noticed the labels used. Some seemed very good, but still not perfect. As in fly-fishing the favourite fly most used is always considered the most successful, so in each garden the label adopted is found to be the best. I was glad to find that the label discussion, whether it discovers a perfect label or not, is considered to have been useful from having drawn attention to labels which were not generally known. *George F. Wilson, Hosterbank, Weybridge.*

HINT FOR SEED GROWERS.—Dr. Aitchison, in his paper on the *Flora of the Karam Valley*, tells us that the leaves of *Edwardia mollis* and of *Adhatoda vesica* are largely collected and mixed with the grain in the rice nurseries to hasten the process of germination by the heat generated during their decomposition.

GROSVENOR GALLERY.

ONE always experiences a sort of relief on visiting the Grosvenor after the Academy. There are fewer pictures in the former, there is some space between the frames, and the works of art are seldom either so high or so low as to make inspection almost or quite impossible. There are fewer lukewarm mediocrities at the Grosvenor than elsewhere; no doubt there are frequent failures, but even in the failures there is generally some evidence of a very serious effort towards success. Many of the Grosvenor pictures are peculiar, but then they are selected with peculiar views; they are like "peculiar" wine—nectar suitable to those who have a sufficiently cultivated taste, but poison to those long accustomed to old port and Bass' Bitter. Sir Coult Lindsay is apt to afflict his visitors with symphonies, harmonies, notes, nocturnes, and scherzos; but if a cultivated gentleman like Sir Coult can see or hear music in these things, they demand some sort of attention even from such enlightened beings as can often only perceive in them slate-coloured panels out of old street doors; the latter persons perhaps suffer from mental "nocturnes," and cannot distinguish a divine harmony or lively musical scherzo from the grindings of a street organ or the cat-call of a street whistler. No. 2 in the Grosvenor Gallery is a "Nocturne, in Blue and Silver," J. M. Whistler. This work is lead-coloured; towards the top there are a few white spots, these are the silver; ten minutes would possibly be sufficient to print (or play) this nocturne, ten hours to paint the lead-coloured ornaments on the gold frame.

Passing portraits by Sir Coult Lindsay, H. Herkomer, F. Hole, S. Hodges, and R. Lehmann, we come to the excellent sea piece by H. Moore, 24, titled "Diary Weather." Though very rough, this is a really admirable picture of a stormy sea under a heavy sky. In 30, "The Storm Cloud—West Lynn, North Devon" (as well as in 9, "On the Road to Montev, from Mentone"), Mr. Cecil Lawson appears to us to show a marked advance on his previous works. 33, "Shooter's Hill, Pangbourne," is a good and notable landscape. 35, "The Shulamite," by R. Spencer Stanhope, is a "peculiar" picture, reminding the spectator of some of the early Italian masters; there appears to be good work in it, but the flowers, of which there are many, are all badly done, and this makes one lose confidence in the other part of the work. 42, "Christmas Roses," by W. J. Mackley, is an excellent picture of pure white-blossomed Hellebore resting on snow, with a heavy wintry sky for background. 48, "Harmony in Flesh-colour and Pink—Mrs. H. B. Meux," J. M. Whistler. We suppose it is possible to have a harmony in flesh-colour and "pink." This "harmony" is a full-length and good, though very rough, portrait of a lady in a phenomenal frame. 54, "Early Attentions," a small figure subj. et, by L. Alma Tadema, R.A., notable for the background of garden Poppies, which are admirably painted. 55, by the same artist, is a life-size portrait of Ludwig Barnay as Marc Antony. Other pictures by this artist are 59, "Hans Richter;" 63, "A Torch Dance," remarkable not only for the figure and its treatment, but for the bronze covered gates. 61, "An Audience," a picture containing several faces excellently drawn and painted; the silver armet of one of the figures is well worthy of notice. In 56 and 58 we have decorative panels by W. Hughes, termed "Pomegranates" and "Oranges." These, though decorative in one sense, are natural in another, and we consider this to be wrong in Art. A decorative panel should be entirely conventional. Mr. Hughes' pictures are conventional so far as the background of gold and artistic curves (different from Nature), are concerned; but otherwise, in the perspective of the leaves and fruits, the panels are purely natural. Both plants are made to differ essentially in habit from the plants they are meant to represent, and we consider this cannot be right. To make branches stick up when they ought to hang down, and to put a graceful curve to a plant which is naturally rigid, must be wrong. We make these remarks in reference also to two other pictures, by the same artist—287, "Golden Pippins" and "Cob-nuts." To make even an Apple stick up when it ought to hang down is in every way as bad as making a bunch of Grapes stand up perpendicularly from a Vine. The chief character of a plant, as a decorative object, rests in its habit, whether prostrate or climbing, rigid or lax, and to alter or invert these habits is as wrong in principle as to paint

figures and trees upside down, or an Oak climbing round a Convolvulus. In the best days of Art these points of habit were strictly attended to. 62, "Danaë at the Brazen Tower," E. Burne Jones, is rich in colour, and displays Mr. Jones' knowledge of the figure; the perspective, however, is incorrect, for the heads of the distant figures should be on a level with the head of the figure in the foreground; the ground is clearly meant to be level, and we can see no excuse or necessity for the perspective being wrong. 67, "Scherzo in Blue—the Blue Girl," J. M. Whistler; this is another life-size figure, not of a wood-painted ancient Briton, as might be inferred from the name, nor a picture of a girl dressed wholly in blue. It is a "scherzo," or "blue-girl" (?) in another phenomenal frame.

The next subjects, No. 68, "Mrs. G. Whitley," by J. E. Millais, R.A., and 73, a portrait, by H.R.H. Princess Louise, are not "scherzos," but admirable pictures, both worthy of close inspection and study. Mr. Richmond, in 77, sends a portrait of Mr. W. E. Gladstone, M.P., which is by no means a success. 86, "Mrs. John Pitt Gardner," by E. H. Corbould (an artist whose works are now seldom seen in exhibitions), is an excellent portrait picture, full of well-drawn and correct architectural and decorative details. 89, "Miss Flamborough," W. Holman Hunt. This picture is so hard, staring, crude, and raw, that Miss Flamborough really looks ready to fly out of the frame. If this elaborated obtrusively coloured picture is Art, what can Mr. Whistler's shadowy "scherzos" be? It would be well for the visitor at this point to compare the adjoining pictures by H.R.H. Princess Louise, Mr. Millais, Mr. Whistler, and Mr. Hunt. 106, "Nocturne in Black and Gold—Entrance to Southampton Water," J. M. Whistler. The black colour, we suppose, is midnight, and appears to be very truthful; the few yellowish spots towards the top of the picture may be the bad gas of night-hidden Southampton; the meaning of this remarkable work is, however, not immediately obvious, we will look at it again. 127, by the same gentleman, is another life-sized portrait, a "Harmony in Black and Red," with very little red. In this room, the East Gallery, there are several works by Mr. E. Burne Jones, all of a mystic ununderstandable character. 139 is "Earth." 144, "The Tree of Forgiveness," a large, important unpleasant picture of a muscular but livid nude man and woman embracing, the latter squidding herself out of a crack in a tree-trunk. 145, "Perseus and the Graie"—the three sisters—who dwell at the world's end, but had only one eye between them. Perseus is shown in the act of meanly taking away this single eye. 157, "The Feast of Peleus."

The most remarkable of all is 175, "The Mill;" the "mill" itself is so subordinate in this work that the picture might with equal appropriateness be termed "the sky"—or "the grass"—it is a grim dance of solemn sisters in rainbow clothes; in the distance are a number of nude men bathing; we should like to learn the meaning of this work. The portrait of "Cardinal Manning," 166, G. F. Watts, B.A., suffers greatly when compared with the superb portrait of the same gentleman by Mr. Millais in the Royal Academy. 179, "After a Storm—Calm," H. Moore, is an excellently painted view of the sea from a long sandy beach; the work in this picture may be instructively compared with the "nocturnes" hang in the adjoining room; if this view of the sea is Art, where is the art of the nocturnes? In 208, "Autumn," Mr. W. J. Mackley paints a group of Grapes, hardly we think with the same success as his flower subjects. 214, "A Study of Poppies," David Bates, is by some mischance so unfavourably placed that an opinion of its qualities can hardly be formed. In the Fourth Room we have a few flower subjects; 233, "Azaleas and Pink Roses," Miss M. S. Storey, is by no means good; 237, "Portrait of the late George Eliot" (Mrs. J. W. Cross), by F. W. Burton, is interesting.

There are 332 pictures in the Grosvenor Gallery, and our limited space prevents further notice of them; a large number of the works show high art qualities and are well worthy of extended examination; the majority of even these we have been compelled to pass over. Such of our readers as have time may advantageously spend half a day in the Grosvenor Gallery.

THE AGRICULTURAL HALL.—We are informed that a Horticultural Exhibition and Market will be held in the Agricultural Hall, Islington, London, from July 24 to August 5 next, and at which every requisite in connection with the garden will be exhibited.

ROCKERY PLANTS IN FLOWER.

A FEW words on some of the alpinas now, at the end of the first week in May, in flower in my rockery, may be acceptable to those who are busy stocking rockeries of their own, and I may add what I have before said, that alpinas which can be cultivated in this damp, cold, and unless climate, can be cultivated in any part of England in places not hopelessly shaded by trees or surrounded by houses.

Veronicas.—The first in flower was pectinata, the blue and the red; there ought to be a white one, and I wish some brother gardener would help me to the possession of it. The plant is an ornamental one, in or out of flower, doing best on flat hollows on the rockery, where it must be supplied with occasional top-dressings of rich, light soil, to keep it dense, and to prevent it from straggling in search of nourishment. One generally sold as *V. prostrata* is of dwarf habit, and an exceedingly profuse flowerer, the thick tufts of flower being of a light mauve colour, and being produced in abundance for about six weeks. It is said to be a variety of *V. teurcium*, but flowers more than a month earlier, is much dwarfer, and to ordinary observation is quite a distinct plant. It increases rapidly without being obtrusive, and is in every way neat and useful. *V. reptans* is the dwarfiest of the species, carpeting the surface either of soil or stones rapidly, and neither leaves nor flowers rising more than half an inch from the surface. It must have moisture. It has been recommended for growing bulbs through, but I should think it is too compact a grower, and intercepts too much nourishment on the surface for that purpose. I have received it from abroad by the name of *Lodoniana*—whether rightly named or not I cannot say. *V. glacialis* is a very neat plant, with compact tufts of leaves close to the ground, and erect flower-stalks rising to a height of 2 inches, bearing several pale blue flowers of fair size. It does well on any part of the rockery. A loose-growing, prostrate Veronica, with pale lavender flowers, not unlike in size and form those of *V. gentianoides*, came to me under the name of *multifida* and *incisa*, and has I think other synonyms. It is light and elegant in habit, and does well anywhere. *V. caucasica* is not unlike it either in habit or colour, though sufficiently distinct. *V. lanceolata* is half way in habit and appearance between the two last and *glacialis*, and is a quite distinct, pleasing variety. *V. satyroides* would be a very good dwarf shrubby plant if it were not so shy in producing flowers. It much resembles in appearance *V. saxatilis*, one of the best of the species for rockeries, both the foliage and the large clear dark blue flowers being very ornamental. It does not increase too fast, but hits pulled from the side root readily if not rooted already. Of several varieties which it has the best are *V. Balfouriana*, with rich purple, and *V. Grievei*, with pink flowers. *V. rupestris*, which must not be confused with *saxatilis*, is too well known to require notice.

Dryas octopetala is not difficult to cultivate or increase, and is worth a place for its neat leaves; it has a small, close-growing variety, wrongly sold to me as *D. tenella*. A finer and more showy plant, but more difficult to root from either layers or cuttings, is *D. Drummondii*, an American plant, which after three years' growth extends over about 2 feet square on my rockery. The flowers are borne on upright stalks 4 inches long, and are light yellow, more plentiful but smaller than those of its European brother.

Etrichium nanum, the flowers of which strongly resemble those of *Myosotis rupestris*, but are larger, and borne close to the surface, is flowering freely. Plants sent by post from Switzerland in September all died, but two obtained from Fröbel in November have done well in the crevices of elevated blocks of limestone, where they can root into deep cracks.

Arcebia cchoioides, planted close against a backing of limestone facing south, has flowered most profusely, and the first flowering is nearly over. From one of my three plants I have just cut fourteen flower-stalks, being told that by this treatment shoots may be obtained which there is a chance of striking. When the flower-stalks were removed there remained visible only five lanceolate leaves, all rising from the same underground base.

Loiselcuria (*Azalea*) procrembers, sent me by Mr. Loder from the Highlands in autumn, and planted by his advice on a flat rock with a shallow layer of peat, is flowering, and seems at present quite established.

Aronicum glaciale, with large Composite flowers like those of *Doronicum*, is remarkable for its dwarf

growth, the flowers opening on the surface of the ground almost without a stalk.

Spring Phloxes I sent notes upon last year. I have to add to the number a most elegant and pretty one with pink flowers, not unlike those of *P. verna*; but the habit of the plant is compact and shrubby. It was given me in the autumn by Mr. Durlidge, of Dublin, and is named *P. amœna*.

P. procumbens seems to be one of the plants which likes a mild winter. It is looking healthy and bearing its short-stalked tufts of mauve-coloured flowers in abundance for the first time for four years. I find that it is a plant by no means generally known. *P. divaricata* is an elegant plant of which it is difficult to have too much, and where the slugs have been kept under is flowering very well.

With *Androsaces* I have followed carefully the excellent directions given by Mr. Corvein in the *Gardeners' Chronicle* for their cultivation, and most of them seem likely to succeed.

Globularia tricosantha is bearing its curious blue buttons more abundantly and earlier than I ever before saw—again the fruits of the mild winter.

Gypsophila cerastioides, either raised here, or given me as seedlings two years ago, has now grown into fine plants a foot square; it is a very desirable plant for the upper flats of a rockery, having a close habit, and pretty nearly white flowers.

An Iberis, probably biennial, sown last spring as *I. gibraltaria hybrida*, is making a grand display out of spare corners amongst the stones, the colour of its very large flowers being rich light purple. It can hardly be expected to be hardy here in severe winters, but late frosts do not injure the flowers.

Houstonia corœula and its white variety are now in full flower; a correspondent lately expressed surprise that it flowers so well in a dry sunny part of the rockery. I have been warned by those who have had long experience of it to avoid such situations, and to choose those which are moist and sheltered, as under the former circumstances it will certainly flower itself to death.

Though I have many other flowers now out which I should like to record, I may be asking for too much of your space, and will conclude with a few words on *Sandworts*. *Arenaria balcanica* is now established all over my sandstone, but does not thrive on limestone, not because its roots have any wonderful chemical power of extracting lime out of the stone and poisoning the plant, but because they cannot lay hold of the surface as they can of the soft sandstone. It looks very well on rough sandstone steps, growing in the angles and running up the perpendicular sides. The finest of the species I consider to be *A. purpurascens*, flowering most profusely, and covering as much room as is granted to it with its large purple-tinted flowers. *A. verna* is certainly hard to establish in cultivation, though I succeeded with some plants out of many; a good substitute for it, which is very easily cultivated, is sold as *A. triflora*, and is a very pretty rock plant. Of other plants now in flower I will do no more than name and recommend *Cytisus Ardoisi*, *Erodium petreum*, *Thalicttrum anemoneides*, *Hippocrepis comosa* and *helvetica*, *Itichinisia alpina*, *Anthyllis montana*, and *Linum alpinum*. I cannot, however, omit the mountain Pinks, the earliest of which, *Dianthus glacialis*, is a gem amongst alpine. I have one, not larger than my hand, on which I to-day counted up to seventy expanded flowers, each as large as a sixpence, and of the clearest rose colour, the height of the stalk being less than 2 inches. *C. Holly Dod*, *Edge Hall, Malpas, May 6*. [Kindly let our readers have a similar record later on. Ed.]

BUFFALO HORN MANURE.—The invigorating and sustaining properties of horn shavings as a manure is being forcibly illustrated at Chiswick in the case of zonal *Pelargoniums* and tuberous-rooted *Begonias* in pots. The wonderful wealth of foliage allied to a sturdy growth seen in the plants, and the splendid trusses of flower seen on the *Pelargoniums* are correct indications of the value of the manure. *Chrysanthemums* grown in soil with which the horn shavings have been mixed grow vigorously, and retain their foliage to the last. The pity is, that the high price charged for it makes its general use too expensive to plant growers. If the price could be cheapened, the vendors would do a larger and doubtless equally remunerative trade. It should be used only with quick-growing succulent plants; or, at least, with great care in the case of slower growing subjects. Its value is probably mainly due to the ammonia it contains.

DOWNSIDE, LEATHERHEAD.

DOWNSIDE, the residence of William Lee, Esq., is situated about a mile from Leatherhead, and within easy distance of London. Here, during the last few years, Mr. Lee has been forming a collection of Orchids that bids fair to become one of the most select and important in the kingdom. In the first place the natural advantages of his residence are in his favour. The air is pure, and the houses are built on the side of a rising piece of ground, protected to a certain extent from high winds. They are in number about a dozen, mostly of the span-roofed form, of recent construction, and of course embodying all the most recent improvements.

Two of the most important requisites in Orchid culture are here provided in a manner as near perfection as it seems possible to provide them under artificial conditions. The first is ventilation, and the second atmospheric moisture. You can walk through all the houses here, linger over and admire the splendid tints and quaint forms of the flowers, and feel no sense of inconvenience, even while the air is sufficiently moist for the healthy growth of the plants and the perfect development of their flowers. The paths are all formed of hard-burned grooved tiles, so that each time they are watered the water finds its way into the shallow grooves, and the surface of the paths is practically dry while evaporation is going on from the furrows. In some of the houses the stages are also made to contain water, which has a cooling effect in hot weather. In most of the houses, too, there is a temporary stage placed above the permanent one, the legs of the former standing in shallow basins of water, so that before any slugs, wood-lice, or other pests can reach the plants they must swim first.

The side ventilation is abundant, and the ventilators are so arranged that the air passes over the hot-water pipes under the stage before it is distributed amongst the plants. The roof ventilation is also ample, the ventilators being at the ridge. The blinds, fixed to rollers, run on laths fixed to supports about a foot from the glass. This plan is now always adopted in the best-managed collections. Capacious cement tanks have been formed under the stages to catch all the rain-water, and as supplementary tanks have been formed to hold other water for "damping down," there is always sufficient rain-water for watering with. The heating arrangements have also been well conceived and carried out; even the cool-house is furnished with four rows of 4-inch pipes, and as this is a narrow lean-to, most people would think it was overheated; but it is always best to be able to maintain the requisite temperature during severe frosts without over-heating the pipes.

The first house is span-roofed, and we enter it from a greenhouse of the same construction; it is specially adapted for *Lycaste Skinneri*, and is kept about 5° warmer than the *Odontoglossum* or cool-house. There are some splendid forms of *L. Skinneri* in the collection. The best, when I saw them some weeks ago, was a fine specimen with nine flowers. *L. Skinneri rosea*: they are very delicate rose, the sepals rosy-red, and the flowers 3½ inches across; a variety named *L. purpurata* had very bright purplish-crimson sepals and lip of a darker tint; *L. delicatissima* was also a very pleasing flower. There are, of course, numerous other plants which succeed in this temperature—about 55° at night. A form of *Odontoglossum cordatum* had its sepals and petals saffron, marked with yellowish-brown blotches and spots; *Cymbidium eburneum* was growing and flowering freely, potted in good loam; *Cattleya gigas*, passing through the resting period, the roots being as dry as possible without telling upon the constitution of the plants; *Dendrobium Jamesianum* and *D. infundibulum* occupied a choice corner by themselves, showing by their healthy pseudobulbs that they fully approved of the temperature and treatment. *Odontoglossum coronarium*, a species not easily suited as to position and treatment, was doing well suspended near the glass. *O. nebulosum*, so liable to damp off when the bulbs are in course of formation, succeeds in this house; and a choice white form, probably *caudulatum*, was flowering.

The next, a similar house, in the range is for *Icandrobium*, and a beautiful sight they present, suspended from the rafters and arranged on the stages—beautiful forms of *D. crassinode*, *Barberianum*, and *D. Wardianum*, with the stout pseudobulbs furnished with flowers 4 inches across; the old *D. nobile* in many fine varieties—of which the variety *Wallichii-*

anum is the most noble—held a prominent place. *D. Ainsworthii* had made long, well ripened growth, producing full-sized handsome flowers. *D. Findlayi*, *anum* here, as in the fine collection of Sir Trevor Lawrence, is proving itself to be a first-class *Dendrobium*, so distinct in growth and so charming in flower. Amongst others not so commonly seen in flower were *D. Veitchii*, a singular species; the reverse of the sepals and petals are very hairy, and of a yellow colour, the deeply-furrowed lip being marked with deep purple lines; *D. helyosumum*, desirable for its perfume, the sepals and petals greenish-white, with a greenish lip, the front portion being yellow. There are of course other *Oreobliis* in this house, which thrive under the same cultural conditions. *Coleogyne ochracea* had eight pendulous spikes, furnished with lovely tinted flowers.

The *Phalenopsis-house* comes next in order, and was the most interesting structure at Downside when I was there, and more than any other exemplified the discrimination of Mr. Lee in selecting the best varieties rather than merely getting together a collection. It contained flowering examples of *P. Schilleriana* of the most splendid description—I measured flowers of this species rather more than 3 inches across, of lovely and varied colours; *P. Stuartiana*, of which there are three fine examples—one had a branched spike, on which there had been twenty flowers; the pure white petals of one variety were marked very slightly with small violet spots. There were of course numerous fine forms of *P. amabilis* and *P. grandiflora*, the last of the purest white; *P. Drymerianum* was also in flower. This is very distinct, the sepals and petals being white, tinged with purple near the base, the lips rosy-purple with a bronzy-yellow suffusion. Of *P. leucorhoda* there is a fine healthy plant, which bore a many-flowered spike. *P. casta*, another supposed natural hybrid was also in flower. *Saccolabium* succeed well in this house, and there are large healthy specimens of many rare and fine forms. *Vanda Denisoniana* is also here, in the form of two fine specimens. There are also good flowering examples of *Aerides Lecaenum*, a species introduced by the Messrs. Low, but which first flowered in this collection; the flowers are of a deep purple colour, thickly placed on short curved spikes. It is very distinct as a species, and very fine flowering.

From this house we enter a large span-roofed Cattleya-house. Arranged on the centre stage were some remarkably well grown *Vandas*, amongst which *Veitch's form* of *V. stavis* was most conspicuous, with two long spikes, on one of which were fourteen very large flowers. These plants seem to luxuriate in the atmosphere of this house. Here also was a grand plant of *Calanthe Dominii*, and in flower were some choice forms of *C. Trianae*; the variety *Prince of Wales* was the best. The sepals and petals of this form are of a rosy-purple tint, with the deepest crimson-coloured labellum I have yet seen. A recent form, selected in the York nurseries, and named *Backhouseana*, was remarkable for a peculiar purple blotch in the centre of the petals.

We now for the first time pass into the open air, and enter a small span-roofed structure, used partly as an hospital, but more particularly for growing *Odontoglossum Rozzlii* and *Cyrtidium niveum*, the first remarkable for the large size of the flowers. A long lean-to comes next in order, and is almost entirely taken up with *Masdevallias*, comprising some remarkable specimens, and the finest varieties that can be obtained. In position it faces the north, and the fine health of the plants shows how well the arrangements as to abundant ventilation, plenty of atmospheric moisture, and other cultural requirements meet their wants. I would like to mention *Masdevallia Cheloni* first, because as seen here it has developed qualities far superior to the varieties grown and exhibited by Messrs. Veitch. I was disappointed with it then, but must now congratulate Mr. Sedon on raising not only the first, but a first-class hybrid *Masdevallia*. It is a cross between *M. amabilis* and *M. Veitchiana*, the last-named being the pollen parent. It is best described as a dark form of *M. Veitchiana* with the colours reversed on the lateral sepals, the bright yellow being outside and deep orange-scarlet inside. *M. Shuttleworthii* is also proving itself to be a charming species; there were two plants in flower. *M. polysticta*, with its quaint densely spotted flowers, with three golden tails attached to the sepals; *M. Veitchii*, very rich; *M. ignea*, flowering freely, the best form being *M. ignea*.

gigantea. Here is a large healthy form of the true Bull's-blood form of *M. Haryana*, from the late Mr. Dawson's collection. *M. Houtteana* has buff thickly spotted flowers with purple tails; *M. macrura* in flower, true, and the true *M. chimera* showing.

In the next house, which is a span-roofed one, for *Odontoglossums*, there were scores of fine species and varieties in flower. *C. Wilkeanum* is one of the most distinct of the yellow-golden forms; there are three plants of it. Of *O. Rosii* majus there were some charming flowering plants, the finest variety being rubescens. Yet another Cattleya-house, in two compartments, one hotter than the other. In the coolest *Zelia harpophylla* was in flower, and in the next several forms of *Vanda* tener, well exposed to the light, grow well and flower freely. Besides this range there is yet another, full of *Odontoglossums*; but there is just space to mention that in one portion of it, which is kept warmer, *Odontoglossum citrosum* was doing remarkably well on the south side, where the plants are well exposed to the light; and on the north side of the house there is an equally satisfactory batch of *O. vexillarium*. The forms of *O. Alexandri* are now so numerous that it would require half a page to give the names only; we must therefore conclude with thanking Mr. Lee for allowing us to see his plants, and to engrave the noble *Odontoglossum lyroglossum*, figured on a separate sheet in this number; and we must congratulate Mr. Woolford, his gardener, on growing the plants so well.

PILRIG PARK NURSERIES.

A HYBRID *Rhododendron* (between *R. glaucum* and *ciliatum*) has been raised by Mr. Grieve, which is likely to prove one of the prettiest of small *Rhododendrons* for rockwork. The flowers of this new variety are pinkish-white, the insides almost pure white, and glistening beautifully when seen in sunshine. They are little more than an inch across, and of excellent form. The foliage is slightly fragrant, and the habit of the plant promises to be small. Altogether, I am justified in saying a great deal in favour of this new addition to small alpine *Rhododendrons*. Amongst large flowering *Rhododendrons* of the ciliatum section the Countess of Haddington, white tinted with pink, and more trumpet-shaped than *ciliatum* (a hybrid between *R. ciliatum* and *R. Dalhousie*) is beautiful, and is probably quite hardy in the milder parts of the country. Of *R. ciliatum* itself there are young plants by the thousand. A collection of seedling varieties of *Azalea mollis* of many shades of orange, pale yellow, pink or salmon, and large well-formed flowers, will be a valuable addition to alpine shrubs, as the Silver Lombardy Poplar will be to trees. A specimen of this new variety with silver-lined leaves is already fully five feet high.

Amongst some rare alpine plants there is a good stock of *Aciphylla squarrosa* (the Wild Spaniard), *Saxifraga MacNabii*, *S. Stracheyi*, and *Senecio pulcher*. There is a large bed of *Primula denticulata* with seedling varieties, and a beautiful collection of *Primula Sieboldii* and its named varieties. Though the latter are here grown under glass, they may well take a high place amongst hardy plants in sheltered positions. Good seedling kinds of white *Iberis*, much earlier than *Iberis corifolia*, are already coming into blossom. There is a fine plant of *Saxifraga bronchialis* with *Draba*-like foliage, and also a plant of *Ranunculus Seguii*, which promises to be a good alpine. *Saxifraga Wallacei* holds its own as the best of that section of *Saxifragas*; it is here grown in large quantities, as is also a good form of *Helleborus niger*. There are several pretty varieties of *Ampelopsis*, and a stock of fifteen or sixteen imported kinds of American *Rubus* for fruiting. *Dahlias* of many kinds, double and single, including *Paragon* and the *Cactus Dahlia*, are grown; and some very effective border *Auricularis* are now in blossom. The collection of *Finks* and *Carnations* later in the season is sure to be well worth seeing, as so many good kinds, old and new, are to be found here. *Pansies* and *Violas*, which may perhaps be called the speciality of Messrs. Dickson's nurseries, will not be in full beauty for a short time longer. So far this season promises to be a favourable one for them. *C. M. Owen.*

LATHYRUS LYBIUS.—This is a dwarf growing species, throwing out several shoots of a semi-trailing character, and bearing spikes of orange-coloured flowers, a great number of blossoms being set in a spike. It is a hardy herbaceous perennial and can now be seen in the hardy border at Chiswick. Lovers of hardy plants should make a note of it.

Orchid Notes and Gleanings.

CORYANTHES MACRANTHA (ELEGANTISSIMA).—Unless I am greatly mistaken, the Orchid so carefully delineated in the last number of the *Gardeners' Chronicle* under the name of *Coryanthes macrantha* is in reality one of the many varieties of *C. speciosa* or *C. maculata*. The flowers in your plate—which I presume are represented of the natural size—are much smaller than those of the true *C. macrantha*, as the same was originally described and figured (from an imported specimen preserved in spirits) by the late Sir William Hooker under the name of *Gongora macrantha* in his *Botanical Miscellany* (ii., p. 151, t. 80). Some flowers produced at Knypersley—from a plant which Mr. Aiton gave me at Kew, circa 1835—were quite as large, and astonished me more than any Orchid blossoms I have ever seen from that day to this. Mere size, however, counts for little as a specific distinction. This latter, in the case of *C. macrantha*, depends on the presence or absence of a number of plaits or ridges,

Leatherhead. It has some resemblance to *O. Wilkeanum*, but the coloration is different. The individual flowers measured not far short of 4 inches in diameter, and had oblong lanceolate coarsely toothed sepals and petals of a bright yellow colour, with bold blotches of chestnut-brown. The lip is relatively small, twisted, fringed and toothed, its disc marked near the base with radiating keels, projecting at the ends into sharp teeth. The sides of the column are prolonged into similar teeth, the whole arrangement suggesting a rat-trap, only the animals to be caught are in this case insects, and the trap is of so humane a character that the prisoners can escape and render good service to another flower. We await further particulars of this noble species.

THE HOLLOWAY ORCHIDS.—We learn from Mr. B. S. Williams that he proposes to hold a grand exhibition of Orchids for two months in his nursery at Holloway. The display, besides the great number of young plants coming on, will include the grand specimens which Mr. Williams has so long been in the habit of exhibiting at various exhibitions, and which we understand, will not this season be sent the usual round. Though we can sympathise with exhibitors, we do not think the public will be the gainers.

FIG. 97.—ODONTOGLOSSUM LYROGLOSSUM.

deep as a Gothic moulding, by which the mesochilium (mid-lip) is horizontally divided. Nothing of the kind is shown in your figure (p. 593) nor mentioned in the accompanying letterpress, where you speak of the central portion of the lip as "a thick stalk-like process, bent downwards, and parallel in direction to the column." But the place where the ridges or "crinkles" ought to be is unintentionally indicated by an arrow, slightly inclined across the mesochilium, and which will be found in the upper right-hand flower of your plate of dissections. I am glad that you have recalled attention to this, the most wonderful of all Orchid genera, for it was rapidly passing out of sight and out of mind, owing to three adverse circumstances, viz., 1, the flowers, though freely produced, are fleeting; 2, they cannot be effectively staged for a grand show; and 3, the plants require more heat than is now accorded to the reigning favourites. *James Bateman, 9, Hyde Park Gate South, S.W., May 6.* [Prof. Reichenbach tells us the plant is his *C. elegantissima*; it certainly differs, as was noted when the plant was shown, from *C. macrantha*. *Ed.*]

ODONTOGLOSSUM LYROGLOSSUM.—This is one of the finest of the newer varieties, but one about which little is at present known. How fine a thing it is may be judged from the illustration on a supplementary sheet, which represents a plant that flowered recently in the collection of W. Lee, Esq., of

ONTON HALL, DEVON.

THIS charmingly situated Devonshire residence, the property of E. Fairfax Studd, Esq., lies some 4 miles from Exeter and about 2 miles from the village of Kenton—a village having every appearance of thrift and comfort in its exterior aspect and surroundings. The village is notable for its church of Exminster stone and its tower of over 100 feet in height. The drive to the Hall is of the most picturesque (and this in the truest sense of the term) kind, where the botanist or lover of wild flowers might spend hours, or even days, exploring the adjacent groves and plantations, which abound largely in the richest flora of South Devon. A slope covered with trees and dense underwood upon one side, and a winding valley upon the other dotted with oaks or wild cherries in flower, and further beautified by a lake or running stream, are among the sights that arrest the eye—吸引 the fancy until one has traversed a lengthy avenue and approaches an ornamental bridge near to the Hall. But why a bridge? There is a lake below it, and at some distance in the opposite direction a clear stream of water—clear as crystal—dashes down a waterfall. Ah! It begins to dawn upon the visitor that this crystal flowing stream and lake are not the work of Nature; but as a piece of artificial work it so nearly resembles a scene in a Highland glen that at first sight

the artificial has a remarkable resemblance to the natural, so successfully has the work been executed. Nor would it surprise one to find a Scotchman, a native of a country that can boast of unrivalled scenery, the head gardener at such a place, where Nature is so faithfully represented.

The Hall is but a little distance from the bridge referred to, but at a much higher elevation. Groups and single specimens of hybrid Rhododendrons are extensively planted (in some cases in large breadths) upon both sides of the carriage drive, between the curve from the bridge and the carriage front. Patches of Rhododendrons only, does the reader think? No; the grounds bristle with the best of the Conifer family, and the woods in the distance budding into leaf make a lovely background to the flowering shrubs. Of Conifers, there are many noble specimens of *Thuja occidentalis*, *Abies cephalonica*, *Picea morinda*, and a magnificent specimen of the Lucombe Oak. The latter-mentioned specimen stands out prominently by itself, in a plot of luxuriant green,

other choice spring flowers, make a fine display in pots; and a strain of blue *Cineraria*, called "Oxton Excelsior," is a remarkably showy variety for the embellishment of conservatories all through the spring months. The show of *Cinerarias* alone make a creditable exhibition in themselves.

There is a *Camellia*-house in the terrace garden, containing a good collection of *Camellias*, which supply flowers abundantly in the early part of the season. The flower and terrace gardens are neatly laid out, especially the scroll designs for carpet bedding, in which Mr. Ayson takes an interest; but at present there is no design ever conceived by the art of man half equal to the natural undulations of the grounds and park, so beautifully furnished with trees and shrubs. Fancy a chain of natural terraces beyond a valley furnished with ornamental trees—a group of noble Scotch Firs by the margin of the stream, before referred to—single specimens of *Pinus insignis* and *P. excelsa*, flowering *Magnolias* and *Tulip*-trees, Cedars of Lebanon, and other rare specimens inter-

with a striking white eye, and with about 2 or 3 inches of growth above the flowers, so that leaves and flowers were about equally mixed, giving a most pleasing effect—the smaller leaved variety, *V. minor*, and dwarfed grower, having pale blue flowers, very pretty, no doubt, but much behind its larger leaved rival in point of effect. Why are these *Vincas* so seldom seen or recommended for planting *en masse* in the spring garden? I will not, however, further dwell upon this point, but proceed to the gardens proper, which are two in number, and both of which are in high cultural order.

In garden No. 1 hardy fruits and vegetables are successfully grown, as any one can see at a glance upon entering the garden. Many of the borders, too, are beautified with herbaceous plants and hardy florist flowers, of which Mr. Ayson has a considerable collection. In the glass department there is a good collection of stove plants and Orchids, several of the latter in flower, and a fair collection of New Holland plants in a cool house by themselves. The stock of soft-wooded plants, especially the decorative or show *Pelargoniums*, is beautifully grown and neatly

FIG. 98.—OXTON, NEAR KENTON, DEVON: E. FAIRFAX STUDD, ESQ.

bounded by a dense wood, and on the Hall side is the "Lime avenue" (now obsolete) through which George III. rode upon the occasion of a visit to Oxton. Near to the Lime avenue there is a considerable collection of Conifers, arranged in what will be best understood as the pinetum style. The most noteworthy are *Thuja Lobbii*, *Pinus muricata*, *Picea Menziesii*, *Cupressus Lawsoniana*, *Wellingtonias* of various sizes, *Cryptomeria japonica*, a perfect specimen; *Libocedrus decurrens*, *Abies Nordmanniana*, and a fine group of *Pinus insignis*, which have undergone the novel experiment of being cut back. The trees, having overgrown their situation, were spoiling each other's symmetry, and with hopeful courage Mr. Ayson has cut them back into pyramid shape, rather than destroy them or thin them out. Mr. Ayson has experimented upon Pines in this way before, and hopes to be successful again.

The conservatory attached to the Hall is literally festooned with beautiful creepers, and the walls are draped with two varieties of *Hellotrope*, which perfume the whole building with an agreeable odour, besides producing hosts of flowers for cutting "all the year round." The varieties are *peruvianum* and *Miss Nightingale*, Carnations, forced Roses, and

mixed, so as to give a variety of tints, independently of flowering shrubs of the dwarf kind, which in so good a climate are furnished with a luxuriance of flowers and foliage unknown elsewhere.

And furthermore, there is at Oxton what a great many people would have us believe are almost non-existent in England, namely, "hardy flowers everywhere"—by the margins of woodland walks, in the woods, in ravines and jungles, and grouped or dotted about by the brink of artificial lakes. A whole group of *Hemerocallis flava*, established upon the brink of a lake, looking so healthy, with its fine Lily-like leaves, is, indeed, suggestive of what has and may be accomplished with hardy plants. Huge bushes of *Rhododendrons* overhang the lake for yards, whilst grand specimens of *Abies canadensis* and *Taxodium sempervirens* shoot up above them to a height of from 40 to 50 feet. It would astonish many to see a fine specimen of the latter thriving so freely, with its roots washed by the lake upon one side, and yet the specimen appears in no way to dislike its situation. Then again there are wild *Primroses* on the grass in broad masses, and *Vincas* by the million established in the woods and plantations. Of the latter two beds in the spring garden were lovely a week or two ago. The large variety, *V. major*, had full bright blue flowers,

trained, as also are other kindred subjects. As a Grape grower Mr. Ayson has won for himself a high reputation, which is ungrudgingly accorded to him by practical neighbours who have known him for many years, and this season's crops in several of the vineries promise to surpass their usual excellence. Pines, Peaches, Strawberries, and vegetables, are also forced in both gardens in about equal quantities; and as the management of both gardens does not differ in principle, and as the results do not differ beyond what would be expected from young stock over old, I will only add in conclusion that a garden which has produced—and continues to produce—the same unvarying results over a long series of years under the same management must be a source of pleasure both to employer and employed. *Abnon.*

CHOISYA TERNATA deserves a place in any choice collection of hardy wall plants. At Kew and elsewhere specimens which have remained in their present quarters some years, and withstood the terrible ordeals of the winters of 1879-80 and 1880-81, are now very attractive; their dark green ternate leaves forming a good contrast with the starry ivory-white orange-like blossoms. An illustration of this desirable shrub will be found in our columns for 1880, vol. viii., p. 625. A native of Mexico.

The Roseery.

Florists' Flowers.

ROSES FOR POT CULTURE.—The fine group of these shown by Messrs. William Paul & Sons, of Waltham Cross, at South Kensington, on Tuesday last, and for which they were awarded a Silver-gilt Flora Medal, suggested the names of a few sorts as well suited for pot culture. There were *Star of Waltham*, bright carmine, large and full; *Comtesse de Sereney*, one of the best of the delicate-coloured H.P.'s; *Duchess of Bedford*, rich bright crimson, shaded with dark, very fine; *La France*; *François Michelin*, large, and very handsome; *Marie Raby*; *Mabel Morrison*, silvery-white, with a good habit for pot culture, but the flowers lack substance; *Madame de Montchauveau*, pale rose, with a pink reverse to the petals, large, full, and excellent habit; *Madame Victor Verdier*; and *Junio*, a fine old Rose, very pretty indeed. To these may be added the new silvery-pink *Rose*, *Queen of Queens*, shown by the same exhibitor; this has large, full, and finely-femaled flowers, but the habit was sparse, which might, perhaps, be an accidental characteristic merely. If the habit of growth be at all commensurate with the quality and attractiveness of the flowers, then it must prove an acquisition for pot work.

ROSE REINE MARIE HENRIETTE.—For growing under glass this beautiful bright deep rose-coloured variety cannot be surpassed. It can now be seen at perfection in the Rose-house at Chiswick, and by the side of it the renowned *Cheshunt Hybrid*. Valuable and attractive as it is, it looks dull and wanting in life, for *Reine Marie Henriette* is singularly bright. This has been asserted by some to have been a sport from *Gloire de Dijon*, but it differs from that flower in shape and build, and in the character of the foliage; but like *Gloire de Dijon*, it is wonderfully free. The flowers also are large and full and equal to the *Hybrid Perpetuals* in quality. It is essentially a Rose for culture under glass, and as it is a free grower it requires space in which to develop itself. It is particularly well suited for planting against pillars in the highest part of the house.

ROSE A. K. WILLIAMS.—Great consternation has seized many Rose growers by the strange conduct of this grand new Rose. It was naturally to be expected that a plant which had been subjected to such severe treatment (every bud, as it appeared, having been cut for propagation) would resent it in some way, and warning was given that deaths might be expected, but certainly not in the proportion or manner which they appear to have done;—one very excellent rosarian told me that he had lost ten out of a dozen. The plants appeared strong up to the time of pruning; there were three or four strong shoots, the union of the bud with the stock was perfect (I am stating what I have seen), and yet the plants were hopelessly gone. They had not that blackened appearance which Rose shoots have when they go off, but simply appeared as if they had died of inanition—not of disease. On looking at my own plants I found one half of them dead, and from other growers I have had a similar statement. The stock seems to have made no difference, for they are in the same condition on the seedling Brier and on the *Maeretti*. It would be interesting to know if this is general, for if so it will be seriously against the Rose; but I am still inclined to think that excessive propagation has been the cause. *Wild Rose*.

ROSE DONNA MARIE.—For covering arches, summer-houses, or arades, this Rose can hardly be excelled. Whether the sun shines stronger in Devonshire than elsewhere, the writer cannot say, but it is evident that nursermen in that county take the comfort of visitors into account as a part of their business. In one well-known hot-rustic summer-houses are erected, some of which are now beautifully covered with this free-growing evergreen Rose, and visitors are said to enjoy these retreats in summer immensely—as, indeed, they will may do. Not a particle of the framework is to be seen from the outside, but a living mass of green leaves and buds—indeed, some of the latter are opening a milky white with a tinge of lilac, which look very cheerful hanging loosely over the green, and a mass of leaves. Such a mass of soft entrance can't other, or throw in a natural way, presenting an appealing surface. *W. D.*

LACED AURICULAS.—Almost without exception what plants of these new Auricula forms were exhibited at the Auricula show were lacking that refinement which should be looked for in flowers worthy the designation of laced. But for the fact that the blooms generally had pale-hued edgings there was little to distinguish them from the ordinary shaded alpine, though perhaps looking brighter and more cheerful, because lighter in colour. If these so-called laced flowers are to be esteemed as a distinct exhibition section they must undergo a refining process—one that shall make the ground hues dense and distinct, and the lacings clear, narrow, and well defined. If the broad lacing as recently seen be tolerated the flowers will presently differ little from shaded ones; indeed, a group of these latter having paler markings than are usually found in shaded alpine was put into the fancy section, showing that the term "laced" at present gets a wide interpretation. It can hardly be expected that a section which has been introduced but a few years can yet have made any considerable advance in the direction of refined quality, but that is all the more reason that in determining what should constitute a laced flower—or, better still, Auricula lacing—we should have some clear and defined conception as a guide in selection and breeding.

It is true the class now set apart for them at the Auricula show is known only as "fancy," which may, and really does, include any rubbish, even the most atrocious floral abortions; but none the less as laced flowers are specially mentioned as admissible in the class, it is but right we should understand, not only what are laced as well as what are "fancy" flowers. This latter term it must be admitted is not a happy one. It is meant to apply almost exclusively to abnormally eccentric forms of show varieties; and, indeed, those shown as "fancies" the other day well justified the criticism that they were Auriculae gone mad. To encourage such outrages against all recognised Auricula laws and requirements is most objectionable—indeed, the bewilderment displayed by observers at the show that such oddities should be staged is not confined to the general public; it is shared in by many florists also. On the other hand, the laced section does largely exhibit features that may, with careful selection, in time produce some very charming flowers. They have robust habit, good and varied colouring, and, not least, will reproduce their kind freely from seed. These qualities should render them most acceptable to amateur cultivators, for the show varieties not only seed sparingly, but produce a large percentage of very inferior flowers that are neither pleasing in pots nor fit for border culture.

With respect to the lacing criterion we need not go farther than the laced *Polyanthus*, which is the most perfect laced flower we have. This shows to us a clear well defined yellow centre, which is, or should be, as clearly defined in any good alpine or laced Auricula. The ground is dense and pronounced, and finally the lacing is narrow, distinct, and perfect. Why can we not strive to make a race of laced Auriculas as refined as these are? Indeed, until they approach to the laced *Polyanthus* in defined markings they will never merit the appellation of laced. It is worthy of note that coarseness in cultivation generates coarseness in markings, whilst the most refined lacing will be got from plants that are not generously treated. The plants should always, when the blooming period arrives, have a good pool of roots, and rather than shifting often it is better to liberally top-dress, seedlings raised from seed sown now will bloom admirably in small 6's, and should be shifted into large 6's as soon as the bloom is over. I find seed saved from the most refined flowers bring the best average quality, and it is only by constant selection that the desired point can be attained. If the Auricula Society will strive to give to laced flowers the encouragement they merit, the result will presently be shown in increased competition in a section that many may easily cultivate. *A. D.*

AURICULA RICHARD HEADLEY.—A superb specimen of this fine grey-edged Auricula was sent to the

National Auricula show at Manchester on the 2d inst. by the Rev. F. Tynons, of Baskin Hill, Drumcondra, Dublin. Mr. Tynons is a well-known and successful cultivator of the Auricula, and if the plant sent is an average illustration of his success with the flower, then every encomium passed on his productions is more than justified. The plant in question had a truss of twelve fully expanded pips, all large, symmetrical, and correct, and so finely veined on the edges as almost to be white. The plant was growing in a comparatively small pot, and it was as pot-bound as it could well be. This fine example, not being sent for competition, was unanimously awarded a First-class Cultural Certificate. By the side of this fine flower was a grand specimen of the Rev. F. D. Horner's new blue self Saffire, raised, we believe, from *Metropolitan* and *Fornosa*. It also had a superb truss of twelve fine pips. This was not in competition with others, as Mr. Horner no longer exhibits at Manchester; but it was very much admired. It is a rare addition to the blue self.

Notices of Books.

Insects Injurious to Forest and Shade Trees. By A. S. Packard, Jan., M.D. Bulletin No. 7 of the United States Entomological Commission. (Washington: Government Printing Office, 1881.) P. 275. 8vo.

This Bulletin deals with the North American insects known to feed on the Oak, Elm, Hickory, Linden, Chestnut, Locust, Maple, Poplar, Butternut, Beech, Elder, Cherry, Hazel, Pine, &c., and in many cases the larger term includes a number of different species of the trees under consideration. It adds another to the already very extensive series of reports on economic entomology that the liberality of the United States Government has enabled the leading entomologists on the other side of the Atlantic to produce. Without exception these publications are of the greatest service, both to science and to the class for whose benefit they are particularly intended. The present bulky "Bulletin" we take to be one of the most important and most valuable. The author's scientific reputation is a sufficient guarantee that it is sound biologically, and (with the exception of many absurd coinings of "English" names) it cannot but be of service to foresters.

But we think it might have been better had the author somewhat modified the title. Every insect known to feed upon a particular tree is treated upon. In his introductory remarks the author states that Kaltenbach enumerates 537 species of insects as injurious to the "Oak" in Europe; a very large number are given as injurious to the same tree (using the term in a broad sense) in America. It is obvious, when we come to analyse this list, that only a very small proportion of these are strictly noxious insects, and then only when they occur in extraordinary numbers, which is only occasionally. It is natural for certain caterpillars to feed upon certain plants, and the damage they occasion is in proportion to their number. We have to deal here only with trees, and beyond the unsightliness caused by occasional destruction of foliage on a large scale, we doubt if the trees suffer permanent injury from leaf-feeding larvae. Naturally a certain amount of functional disturbance must result; but surely an equal or greater disturbance arises from judicious pruning or lopping, even although this is usually carried out at the season of least functional activity. Our author, however, regards these insects as "parasites," not specially injurious, adding that the deadly form are comparatively few. Probably under this latter limited class he includes some of the wood or bark feeders. He is possibly right in some instances, but we feel sure that the morbid conditions commonly attributed to the presence of lignivorous insects are more frequently due, in the first instance, to "something wrong at the root," inducing an unhealthy state which the insects seize upon just as flies attack carrion, or visit an ulcer on a beast's back.

We must not forget to notice that Dr. Packard's volume is most copiously illustrated by excellent woodcuts.

At this moment a lady (Miss E. Ormerod), eminently qualified for the position, has received the distinction of being appointed honorary biological secretary to the Royal Agricultural Society—the first time that economic entomology has received any official recognition in this country. She can, and doubtless will, do much good (as she has already done) in enlightening our agricultural classes as to the nature of the insect pests that trouble them, and by instilling into their minds the axiom that "prevention is better than cure." Keep up a vigorous state of health, and the damage caused by insects will occasion little anxiety as a rule, and to this end the advice of an economic entomologist should mainly be directed. But these are exceptions, and when these assert themselves in an extraordinary degree (as will sometimes happen) we fear the only thing is "to grin and bear them."

The Kitchen Garden.

Plants and their Culture.

THE nature of the weather which we have been and are still having has been everything that could be desired for the well-doing of the subjects of this department, consequently the various crops are in a flourishing condition. Continue to make small sowings and plantings of Cos and Cabbage Lettuce at short intervals, so as to maintain a good succession. Plant out Cauliflower and Cabbage plants, including the Red Dutch Cabbage, were not already done, and in quantity according to the demand, and which, if planted during showery weather, experience very little check in being transplanted. Make another sowing of Early London and Veitch's Autumn Giant Cauliflowers, of Carter's Heartwell Marrow, and Wheeler's Imperial Cabbages, to come in for autumn and winter use. Another sowing of Early Horn Carrots for drawing from, and of Early Elm and Dwarf Curled Savoys for late plantings, should be made; as also another sowing of Turnips. Thin out successional crops to 6 or 9 inches in the rows. Sow some more Spinach, and clear the ground of the winter crop as soon as the spring-sown one is fit for use, getting the ground manured and dug in readiness for other crops.

Where Parsnips are much sought after, a sowing made now will come in well for late use. Asparagus beds should be looked over daily, and all the "grass" cut as soon as it is fit, washed, sized, and tied up in bundles, and stood on the ends in saucers containing a little water in a cool room until required for use.

Ere this the Seakale season will have terminated, therefore the pots and boxes with which the plants were covered, together with the material which has been used as a covering, should be removed forthwith, as also should the flower-stalks on Rhubarb plants, which in some cases will be showing somewhat freely, as soon as they appear. Young plants of Broccoli, &c., should be picked out in nursery beds as soon as they are large enough to handle—at all events, before the plants become crowded in the seed-beds—preparatory to being finally planted out. The plants should be allowed sufficient room to develop themselves during the time they are intended to occupy the nursery-beds. This is a procedure that deserves more practical attention and adoption than it always receives, for it not infrequently happens that seedling Broccoli, Cauliflower, &c., are allowed to grow closely together in the seed-beds until they are required for finally planting out; and, under these conditions, the plants, instead of making a stocky and consolidated growth, become lanky and weak. Early Peas, which are now podding, will be benefited by having an occasional soaking of diluted liquid manure, and Vegetable Marrow plants should forthwith be planted on the mounds or beds previously prepared for them, and under the protection of hand-glasses.

If not already done, plant a sufficient number of Beetroot at the foot of a south wall for seed, and for the same purpose put sticks, one to each of the best-formed heads of Cabbage, as a means of indicating their intended use.

Where former directions in the way of seed sowing and planting have not been attended to, no time should now be lost in carrying out those cultural details in accordance with existing circumstances. Look over the crop of autumn-sown Onions, pinch the tops out of those showing a disposition to "ran," and bend the stems of the others, not only with a view to reducing the chances of their running to seed—but to hasten the development of the bulbs. Cauliflowers, like everything else in this department, are "turning-in" rather early this season, and the early plantings of Potatoes are also very forward (meeting in the rows) for the time of year, and should "Jack Frost" only keep away the supply of young Potatoes will be early, plentiful, and good. Late plantings of both Cauliflower and Potatoes, Brussels Sprouts, &c., will require attention in the way of earthing them up; and now that we seem likely to get a spell of dry weather the Dutch hoe freely among young crops and let cleanliness and neatness, in addition to judicious cropping, be the order of the day. *H. W. Ward, Longford Castle, Wilts.*

STOVES: TABLE PLANTS.—Some bright, well-colored examples of the various types of Crotons should be selected for cuttings; these, if successfully struck now, will be of valuable service as table plants during the latter part of the summer. Keep up the requisite stock also of the best of the Dracenas and of Pandanus Veitchii. Of the former class of plants *D. gracilis* should not be overlooked; after the tops of these are struck side shoots will quickly push forth. These will make the prettiest and most graceful plants for the table. An old stool of *Cyanophyllum magnificum* will often yield many young growths that may be turned to good account for the same purpose. Where a well variegated stock of *Cyperus alternifolius* is to be had division should be resorted to. This is a pretty change for indoor decoration, so also is the variegated form of *Cyperus laxus*. If perchance a variegated Pine-apple (*Ananassa sativa variegata*) should be fruiting take care to secure the crotons; these, if potted into 4-inch pots, will soon make nice stuff, with better habit than can be had in suckers. Small cuttings of *Dicentra Fuchsii* Bausei, when struck and established in small pots, can always be turned to good account. Secure any stray seedling Ferns also. Of these, *Asplenium cicutarium*, *Adiantum canescens*, *concinnum*, and *decurans*, as well as *Lomaria gibba* and many of the *Pteris*, will all give a serviceable change. Small plants of *Caladium argyrites* are at all times of good service. For table plants, these should be kept turned round to properly balance their foliage. Small plants of Palms, such as are useful in little pots, should be abundantly supplied with water; if a shift is really necessary, give them the benefit of the same, but only into one size larger. Plants of Gardenias that are relieved of their first crop of flowers should be potted at once, where this operation is required to be done. A fresh growth should then be secured as quickly as possible, and a good supply will soon be had again. *Tuberanemontana coronaria* fl.-pl. is with me succeeding the Gardenias; this plant appears to delight in abundance of heat and moisture at the roots. Its fragrance, also, will recommend it to many who are not partial to powerful perfumes. Young growing stock of the stove Vines, the shrubby *Clerodendrons*, *Ixoras*, and *Allamandas*, should be kept pinched till a nice crop of shoots is obtained. Encourage all young seedling plants of *Aphelandra antarctica* Roezli, *Torenia*, *Gloxinias*, and *Amaryllis*, to make as good a growth as possible. *Achimenes* grown in either pots or pans should be kept near the glass; these, when in vigorous growth, may receive a supply of weak guano-water. Any that may be grown in baskets will require close attention to see that they do not get dry; this remark must also apply to all other basket plants from this time onwards, and to Ferns in particular, which will be spoilt for months to come if but once neglected. I have found it a good plan to water basket-plants late in the evening, if perchance they are suspended in a position where the drip from the same would cause any inconvenience.

GREENHOUSE PLANTS, &c.—Our stock of *Deutzia gracilis* has made a good growth since yielding an abundant crop of flowers. We have kept them so far in ainery at work, but must now soon remove them to cooler quarters, and then to the open air. Under this treatment a certain yield is obtained every year. Winter flowering Heaths and Epacris lately potted and now growing fast, must also be hardened off to prevent their tender shoots becoming too much drawn. Give every encouragement to *Camellias* now making their young growth; as soon as the foliage becomes somewhat hardened they should be exposed to more air. Any that are growing in the open border should also be top-dressed where necessary. With good fibrous loam and sound peat an excellent compost can be made, adding a few half-inch bones or charcoal, and either road-grit or silversand to keep the soil open. Recently struck cuttings of *Spartanopia africana* we intend to run upon a single stem to make standards from 5 to 6 feet high.

We have found them to do well in this way, the flowers showing to better advantage also. A most useful, but seldom seen plant, in a pot at least, is *Celsia cretica*. Of this we shall sow some seed as soon as ripe. The almost perpetual way in which it continues to put forth fresh spikes with bright yellow flowers, quite distinct from anything else, will recommend it to any one with a greenhouse at command. The stock of tuberous Begonias will now be opening their first flowers. Strike any strong growths that may require support, and supply the plants liberally with water. Tea-scented Roses will give a never-failing supply of their deliciously-scented blossoms if a little heat is at command. Occasional doses of liquid manure will be beneficial. The stock of *Fuchsias* to succeed the show and fancy Pelargoniums should not be stopped after this; later batches and young stuff should, however, be treated as previously recommended. Seedling plants of such annuals as single and double *Petunias*, Ten-week Stocks, the large-flowered forms of *Mimulus*, *Lobelias*, and *Salvia patens*, must all receive attention now that more room may be expected by the release of the bedding plants. All these that I have named will be found useful in many ways either for the conservatory, or for ornamental wire baskets in verandahs or corridors. Where Balsams are grown, give them a place near the glass, with sufficient air to keep them sturdy and dwarf. *Globe Amaranths* must be kept in a brisk heat; so also should *Celsia pyramidalis* area, and *C. coccinea* if good plants are desired. *James Hubben, Gunnesbury House, W.*

ADIANTUM COLPODES.—The cultivation of Ferns for cutting, or rather, one should say, the practice of cutting Ferns, has grown into a serious business in many private establishments. Grow what one will—it matters not how well the plants are grown—in a limited space the daily cut, cut, either reduces the plants to a state of feebleness, or at the very least renders them veritable skeletons to what they otherwise would be. Grow the plants in pots, and cut them over weekly, nearly as fast as they grow—well, you cannot expect to have your loaf and eat it. But some expect that the supply of Ferns, like the case of oil of old, should never fail, and to such it may be of some interest to notice the above variety of Maidenhair, which will grow almost anywhere under a glass roof without potting and the aid of a skilled gardener. By the side of a path, on a stone or brick wall, all that is necessary is to insert the roots of the plants between the joints of the stones or bricks, and to keep them supplied with shade and moisture until they lay hold of the surface of the wall, which they will cover in time, and improve in appearance. The variety is not unlike the old *Capillus-Veneris*, and is nearly as hardy. Numerous varieties of greenhouse and hardy Ferns have, from time to time, been recommended for cutting, but it is a well-known fact that ladies will have Maidenhair in preference to anything else; and a Fern that requires so little cultural attention when grown as described, as the variety above-named, ought to be grown by everybody desiring to have a useful stock of fronds for cutting by the cheapest mode of production. *W. H.*

Peaches and Nectarines.

THE fruit in the early houses will by this time be swelling off, and will have commenced colouring. All stopping and tying down should be completed as soon as possible, and the fruit well exposed to all the sun and light it is possible to give them. Keep a somewhat drier atmosphere by allowing the evaporating troughs to become dry, but continue syringing until the fruit begins to ripen, using ram or soft water for that purpose if possible. Have a nice circulation of air on by night as well as by day in order to get the fruit full flavoured. Give the roots a thorough watering with tepid manure-water, which should carry them through the ripening process. I sowed an Early Beatrice a day or two ago, but, as I have said before, they are very small indeed, and (with me) it is a very shy bearer, and not worth growing except for its earliness. Trees in succession-houses will be growing freely; give them liberal supplies of weak tepid manure-water as they require it, and keep a steady night temperature of about 60° during the stoning period. Syringe very freely, to keep spider in check, &c., besides spraying on gently late leaves according to the time they are required to be in. If greenfly is troublesome (and it usually is), in late houses especially, notice the trees with a solution of 2 oz. quassa chips and 2 oz. soft soap boiled in 1 gallon of soft water. *J. Wallis, Keele Gardens.*

APPOINTMENTS FOR THE ENSUING WEEK.

WEDNESDAY, May 17	Royal Botanic Society's Show. Sale of Imported Orchids, at Stevens' Rooms. Reading Horticultural Society's Show. Royal Horticultural Society of Ireland's Spring Show.
THURSDAY, May 18	Sale of Imported and Established Orchids, at Stevens' Rooms. Sale of Bedding and Greenhouse Plants, at the Faragon, Nursery, Streatham, by Protheroe & Morris.
SATURDAY, May 20	Crypsalid Flower Show.

A COMMUNICATION, interesting in itself and specially so inasmuch as it must have been one of the last matters to engage the attention of our great naturalist, DARWIN, was read before the Linnean Society at its last meeting. The subject was the production of a new variety of Sugar-cane by a process of apposition, and which opened up the whole question of GRAFT HYBRIDISATION. The paper was forwarded to Mr. DARWIN by a Brazilian planter, with a record of confirmatory experiments by Dr. GLASL, Director of the Botanic Garden of Rio Janeiro, and communicated to the Linnean Society. According to the statements made in the paper, duly and formally attested by a number of planters, a new variety had been produced by taking two cuttings of different varieties of Sugar-cane, dividing the cuttings in halves lengthwise, and then tying the cut surface of one-half of the one to the corresponding surface of the other. Then by means which we need not detail, but which seem to be similar to the *greffe à double bouture* of the French, and which is employed for propagating *Acubas*, union is effected, and a new bud or shoot produced, possessing, not characters intermediate between the two varieties, but characters sufficient to lead the authors to speak of it as an entirely distinct variety—a circumstance which leads us to think the experimenters are attempting to prove too much.

In addition to the sworn testimony photographs were sent, but from the slight inspection we have been enabled to make of them, we should not deem the evidence they afford as sufficiently conclusive. Of course there is no reason whatever to doubt the perfect good faith of the writers; but in a case of such importance it is only right to require that the evidence they lay before us should be made as rigorous as possible, so that misinterpretation of facts should be as far as possible excluded. Gardeners in general who, or their ancestors, have practised the art of grafting from time immemorial, are almost without exception unanimous in their verdict against the possibility of graft hybridisation; but, on the other hand, they must and do admit the existence of some modifications, else the utility of grafting at all would, to a large extent, be negative. The truth seems to be that physiological differences are produced—the stock acts in this way on the scion, and to a less degree the scion on the stock. It is needless to give illustrative instances, as they are familiar to every gardener, and we have so often adverted to the matter in these columns, and given so many illustrative cases, that it is needless now to repeat them.

It must be admitted that, as a rule, the changes produced are chiefly physiological, actual changes of form so marked as to be obvious to the unaided vision being relatively few. Still they do exist, and if the proportions they bear to the enormous number of cases in which no such visible effect is produced is apparently infinitesimal, yet the presumption is that as marked physiological change can hardly exist without change of structure, so it is only the imperfection of our vision and the coarse methods of our observation which prevent us from seeing it. If this be admitted, and we think it must be, the possibility of graft hybridisation must be admitted also. Then such cases as that of the *Cytisus Adami*, of the Potato, of the Vine (several cases), of the Pear, and of many others

which have been recorded in these pages from time to time are, taken as a whole, inexplicable upon any other hypothesis. The numerous cases where a variegated scion has communicated its properties to a green-leaved stock, of which we have also seen numerous cases, are sufficient to prove the reality of the reciprocal influence, though it is perhaps not fair to adduce a constitutional defect as a case of graft hybridisation properly so called.

We believe, then, that graft hybridisation is quite possible—nay, that it does occur; but under all the circumstances of the case we are justified in demanding the most rigorous evidence possible before we can admit that any individual case which may present itself is really attributable to hybridisation of this character. Grafting of any kind in the case of monocotyledons is indeed of doubtful possibility. It is true we have heard of the grafting of *Dracenas*, and we have heard of flute-grafting in the case of some grasses, but we do not think in either case that the evidence is free from suspicion. These matters demand careful experiment and most minute and patient examination, and there are few matters that might more profitably attract the attention of experimenters with the requisite intelligence, skill, and patience. The matter would not be of purely scientific interest, but clearly also of practical value. We trust, therefore, that, instead of having to rely, as we do now, on a very few isolated examples which occur to us, as it were, by accident, we may in the future have a body of evidence, founded on careful experiment, and from which all sources of doubt and fallacious interpretation may be banished.

— THE TEMPERATE-HOUSE AT KEW. — It would be hard to say which of the many houses at Kew finds most favour with the public, but, as our illustration shows (fig. 90), those who prefer the Temperate-house have good grounds for their preference. The noble specimens of *Araucaria brasiliensis* and *A. Bidwillii*, the *Dracenas*, the Tree Ferns, the Rhododendrons and *Acacias* in their season, the many classified representatives of the flora of Australia, New Zealand, the Cape, give a special charm to this house, while the noble general appearance of the luxuriant vegetation produces an effect which is so sure to be pleasing that the wonder is that owners of gardens do not more often imitate, according to their means, the pattern set them in this noble structure, where the impression produced is gained at comparatively so little cost and trouble. It is to be regretted that the plans for the completion of this building have so long been allowed to remain uncarried out. Perhaps the winter and early spring months are the times to see the winter garden at its gayest, for then the Australian *Acacias*—many of them planted out in the beds have attained the dimensions of trees—large bushes of *Camellias*, and a host of other early-flowering things enliven the scene. All the *Acacias* have now passed with the exception of a splendid bush or two of *A. armata*, and the elegant *A. pulchella*, whose tiny pinnate leaves are almost completely hidden with the profusion of bright golden yellow balls. Many showy plants which are largely cultivated for greenhouse decoration, and which are generally seen in a small state, exist here in huge specimens, and so a fairly good idea is given of the aspect assumed by them in their native countries. Such are *Polygala myrtilifolia* and *P. grandiflora*. Two other Australian shrubs are too showy to pass over, viz., *Eutaxia myrtilifolia* and *Bossie linophylla*, to h masses of small orange and brown pea-shaped blossoms. The former is a neat-habited, erect bush, whilst the other, with long pendent branchlets, laden with innumerable flowers, forms what may be called a floral fountain of exquisite grace and charming colour. *Doryanthes Palmeri*, now flowering for the first time in Europe, has already been noted and figured in these columns. Another plant of considerable interest is also in flower, *Decaisnea insignis*, the only species of a genus which Sir JOSEPH HOOKER, in his magnificent *Illustrations of Himalayan Plants*, says, in many respects, is one of the most remarkable plants of the Himalayan forests. It belongs to the natural order, Berberidaceæ, but is wonderfully

different from any other Berberidaceæ plant. It has long pinnate leaves, borne in a crown at the head of an erect stem about 6 feet in height, and long drooping racemes of large greenish flowers—the foliage both in texture and size resembling somewhat that of *Ailantus glandulosus*. Sir JOSEPH, moreover, states that *Decaisnea* is well worth cultivation in England for the sake of its fruit alone, which is conspicuous and handsome, of a pale yellow colour, full of a white juicy pulp that is very sweet and pleasant, and is eagerly sought after by the Lepidæ. A figure of this peculiar shrub is being prepared for the *Botanical Magazine*. Several Himalayan Rhododendrons, most of which have been specially noted in these columns, are particularly showy just now, all, with the exception of the purple *R. niveum*, being white flowered—*R. Aucklandii*, *R. Veitchianum*, *R. calophyllum*, *R. Edgeworthii*. Close under a huge mass of the Australian "Fern Royal," *Todea barbara*, which in imported many years ago weighed 14 lbs., a good plant of *Philecia buxifolia* is luxuriating amongst the moss-covered stones; its lovely *Lagereria*-like flowers being more freely produced than we ever saw them when grown in pots. In the same piece of rock-work two other allied plants from the same quarter of the world, *Chili*, &c., are quite at home under similar conditions—*Callitene polyphylla* and *Luxuriaria radicans*; both have gracefully drooping pure white flowers and Box-like leaves, dark green above and glaucous beneath—the former was discovered in South Chili by the late CHARLES DARWIN. On the shelves, where the plants are arranged geographically, so as to give a comprehensive idea of some of the principal characteristics of the temperate vegetation of various parts of the world, the most noteworthy objects are as follows—*Agapetes buxifolia*, from India, with a profusion of splendid scarlet tubular blossoms with spreading limbs; *Vaccinium serratum*, from the same country, with panicles of creamy-white flowers—both these, although succeeding perfectly in pots treated like ordinary conservatory stock, being generally found in their native haunts as epiphytes, high up on the mossy branches of trees. *Vaccinium caracasense* makes a nice pot plant; it has glossy glaucous leaves and terminal clusters of racemes of creamy-white bells. *Fuchsia arborescens*, sometimes met with under the name of *F. syringiflora*, is also a decided acquisition for the cool conservatory; it has large panicles of lilac-purple flowers, and is very unlike the ordinary conception of what a *Fuchsia* must be. A large specimen of a totally different species, also from Mexico, *F. splendens*, planted out in one of the beds, is worthy of special attention, the bright scarlet tube (which is much compressed at the base) and green sepals and petals forming a somewhat striking contrast. Small plants on the shelves, nicely flowered, prove that it may be grown successfully even where space is a consideration. *Felicia frutescens* is a Cape Composite of neat habit with small linear leaves and lavender-blue, yellow disked flower-heads. The pretty Australian *Irid*, *Paterosonia longicaapa*, with its long narrow grass-like leaves and three large mauve-coloured perianth segments, attracts the attention of most visitors. The only climber now in flower worthy of special mention is *Lonicera sempervirens*—the Scarlet Trumpet Honeysuckle. This is certainly one of the best corridor climbers. In the open it gets killed at Kew, and even with shelter and great care only manages to exist. Few would however deny its claims for room in a cool house after seeing the Winter Garden plant.

— MONDAY FLOWER SHOWS.—It is only under very exceptional circumstances that shows should be held on Mondays. The Sunday is as much needed as a day of rest by the gardener as by any other class of toilers, and, apart from other considerations, it is on humanitarian grounds that this position should be maintained. An exhibitor is always very busy on the two or three days before the show, and especially on the one immediately preceding it, and if this happens on Sunday it must needs be a day of unremitting toil and anxiety, and it means a deprivation of the Sunday's rest. And not only does it mean this to the gardener, but to others to whom the flower show gives employment. It is not right nor good policy to force men to work on a Sunday who claim it as a day of rest and respite from labour. Besides, employers as a general rule properly object to their gardeners exhibiting at Monday shows because Sunday work is necessitated thereby.

— OLD OAKS AT DITTON PARK.—Probably at one time denizens of a part of Windsor Forest, now very prominent and interesting features in the Duke of Buccleuch's fine park of Ditton, near Slough, are a number of aged Oaks, some yet worthy the designation of trees, and others mere stumps, wrecks of their former grandeur, not unlike the once heap of stones that alone remains to tell of the more turreted castle or lofty tower. Fancy roaming riot would fain conjure up the days of PUCK and his attendant sprites when fairy elves danced beneath the leafy shade, and waltzed at night to the song of the nightingale or the chirrup of the mole-creeper round the giant stems. But fancy soon comes to earth, and fairy forms instantaneously fade, when there arise dim yet form-like visions of old JACK FAIRSTAFF and his ragged crew rioting and roystering beneath the forest glades, for so huge are the trunks that yet stand, and such evidences of age do they bear, that if some 500 to 600 years old, as is assumed, they were sturdy trees when HENRY V. was Prince of Wales, and cutting some merry if unpropitiously capers. One huge tree, yet the most flourishing of all the ancients, has a monster stem. There is no tape at hand to obtain accurate measure, but extending arms of average length show a measurement chest high of 30 feet circumference. From off one a recent gale tore the last branch, and has left it a ruined, forlorn-looking monster. On one or two there still remains a fair array of dead, leafless branches, but every vestige of bark has disappeared. Another shows some 20 feet high that its huge stem has gone to decay, and has left but a natural hollow cylinder of bark. How easy would it be to manufacture from this giant some terrible story of the boy who, playing truant from school, and engaged in bird-nesting in this tree, fell into the deep hollow, and there met with the fate common to all naughty boys; or the sensationalist, flying at higher game, might base a terrible story worthy of Miss BRADSHAW on the fearful punishment which befel the audacious pibeletan who, daring to woo the only daughter of the noble house, was thrown into this woody prison, and starved to death. We are not curious enough, however, to look for the remains of these fictitious criminals, finding more pleasant employment in admiring the remains of once truly noble though now fast decaying forest monuments.

— THE METEOROLOGICAL SOCIETY.—At the ordinary meeting of the Society, to be held at 25, Great George Street, Westminster, on Wednesday, the 17th inst., at 7 P.M., the following papers will be read:—"On the Diurnal Variation of Wind and Weather in Relation to Isobaric Lines," by the Hon. RALPH ABERCROMBY, F.R.S. "Mechanical Combinations of Storms, Hurricanes and Cyclones," by W. F. STANLEY, F.R.S., F.R.M.S.

— SAXIFRAGA CLUSII.—At Kew this pretty Saxifrage is flowering freely, and affords an interesting example of what some plants will undergo without injury. A number of specimens were collected on the Pyrenees last season by Mrs. W. T. THISELTON DYLLA, and kept for a month in a tin box before they were brought to Kew. This species in general appearance approaches our native *S. stellaris*, which is found by alpine and subalpine hills in many places in Britain and Ireland. The petals are white, with a yellow blotch at the base, and the anthers red.

— Mr. JOHN MORRIS, who for thirty-two years has been Gardener and Steward at the Manor House, Wethersfield, has commenced business as a nurseryman and florist at the Manor Nursery, Baintree, Essex.

— THE ROYAL SOCIETY.—Among the fifteen selected candidates for admission into the Society are CHARLES BARON CLARKE, M.A., F.R.S., well known for his tried services in the elaboration of the *Flora of India*; and FRANCIS DARWIN, M.A., F.R.S., who has assisted his late father in many of his more recent researches, as well as undertaken independent and most useful work in physiological botany.

— IFFES GIBERTALICA HYBRIDA.—A pan of this distinct hybrid *Candytuft* was shown in excellent form by W. BROCKBANK, Esq., of Didsbury, at the recent Anticilia Show in the Town Hall, Manchester. It is said to be a hybrid between *I. gibraltarica* and

I. corifolia, and it is decidedly intermediate between those two, having the character of foliage of *I. gibraltarica*, but of a smaller and more compact character; with flowers and trusses of the size and shape of *I. corifolia*, but suffused with pale lilac. It is quite distinct in character, and it should prove as hardy as *I. corifolia* it will be a great addition to our hardy evergreen *Candytufts*. The raiser's name did not transpire, but we believe the seed was distributed by Mr. WILLIAM THOMPSON, of Ipswich. The plant was awarded a First-class Certificate of Merit by the Council of the Manchester Botanical and Horticultural Society. It was one of several interesting hardy plants shown by Mr. BROCKBANK, who is gradually making a rare and valuable collection of such subjects.

— ROYAL HORTICULTURAL SOCIETY.—The following provincial floral and horticultural societies have been admitted into union with the Royal Horticultural Society this year, and have received the usual Medals to be competed for at their shows, viz.:

Atherstone Horticultural Society.
Bristol Cheshamham and Spring Show Society.
Gloucester Horticultural Society.
Dalton-in-Furness Horticultural Society.
Ducham, Northumberland, and Newcastle-on-Tyne Horticultural Society.
East London Floricultural Society.
Maulstone Horticultural Society.
Norwood Amateur Floral Society.
Royal Agricultural and Horticultural Society of Jersey.

We trust the Council will extend their operations in this direction, so that the Society may become truly national. It is to be hoped that every effort will be made to keep up the importance and interest of the fortnightly meetings, which are of far more real value to horticulture than the larger and more costly shows. We could dispense with the latter without much regret, but the loss of the former would be a serious blow indeed. For their own sakes, we trust the nurserymen will not neglect these exhibitions, for it is not possible for them to gain so much advantage in any other way, nor to secure so much publicity. A report of an authorised society like the Royal Horticultural Society must be given by the Press almost as a matter of right and duty; but it is far otherwise with the exhibitions made by individual tradesmen. Again, we trust the Society will see to it that every facility is afforded to exhibitors, and that their claims will not be pushed aside for matters so foreign to horticulture and the work of the Society as fancy bazaars, as happened on the last occasion. We note that among the new Fellows elected on Tuesday was His Majesty the King of the NETHERLANDS.

— PHYLANTHUS ATROPURPUREUS.—The one great want in our plant stores is lack of distinct or striking effects, the absence of which is often spoken of by those who know least how to suggest a remedy. But the defect is patent to any one. A houseful of *Crotons* or *Diancuses* is admittedly beautiful, but where either the one or the other is grown to the exclusion of other plants the practice seriously militates against producing that cheerfulness which is created by grouping plants of neutral colours. The plant above named is one that may be mentioned as possessing both the habit and colour which would give the effect indicated. Arranged in connection with *Palms* or *Ferns* the purple leaves give a distinct tone which is not supplied by many other plants, and under a ray of sunshine few people can have failed to observe how the leaves change to crimson, so that under certain conditions of light and sunshine a plant appears to have both purple and crimson coloured leaves.

— TODEA PELLUCIDA AND T. SUPERBA.—There is no doubt that these plants are too much codified as a rule, and that they will bear a temperature much lower than is usually supposed. In Mr. SMEE's garden at Wallington the two species just mentioned have survived for several winters in the open air with the protection of a hand-glass only. One of the finest displays of these and allied plants is, of all places in the world, in a large unheated window-case at the back of a house in Upper Grosvenor Street, London. Mr. COOPER FOSTER has found the secret of growing these plants to perfection, and the basis of the secret is to let them alone. Shading when necessary, as near uniform temperature as possible, a moist soil and

atmosphere—these are the conditions under which a back window in Grosvenor Street has been turned into a veritable botanic garden, so far as filmy *Ferns* are concerned, with the difference that the plants are better cultivated and better grouped than they often are in more pretentious establishments.

— MR. LAWES.—We are pleased to learn that a baizeety is to be conferred on Mr. LAWES. Rarely has public distinction of this kind been more worthily earned.

— THE LATE REV. J. C. NELSON.—We learn that it is intended to place a stained glass window in the chancel of Alkborough Church, as a memorial to a man who succeeded in winning the confidence and warm respect, not only of his immediate neighbours, but also of all horticulturists with whom he came in contact. Communications should be made to the Hon. HAROLD HARROLD, Alkborough.

— SAXIFRAGA CAMPOSI is one of the showiest and most desirable of the "dactyloid" Saxifrages. It is a neat and vigorous grower, forming a compact carpet of light green foliage, bearing numbers of large white blossoms. Altogether the plant does not attain a greater height than 4 or 5 inches. It is a native of the mountains of Spain. At present it is perhaps the most attractive Saxifrage in the Kew collection. A figure will shortly appear in the *Botanical Magazine*.

— RHODODENDRON FORTUNEI.—The exhibition of two specimens of this little known but beautiful and hardy species at the Royal Horticultural Society on Tuesday last is worthy of a note, to call attention to its history as given by Mr. MANGLES before the Scientific Committee and quoted in another column, and also in illustration of the value of the committee in question. One specimen was shown by Mr. MANGLES under its correct name, the other was shown by the exhibitor under another name, given, as we understood, by the exhibitor himself, certainly without sufficient enquiry as to whether the plant was already named or no. A quite unnecessary and misleading synonymy has by this happy chance been stopped at once. The Society and its committees should exercise the greatest care not to sanction the use of a name for a plant shown unless they are satisfied that the plant has a correct title to the name. If people will exercise their right of baptism without adequate care, that is all the more reason why the Society should be stringent in its determination not to sanction such names without inquiry. The flowers in question had the appearance, so far as their undecided colour is concerned, of a hybrid, but, on the other hand, they had that undefinable look which so often pertains to the plants of particular countries, and which renders it practicable often to guess with some approach to correctness at the native country of a plant from its appearance only. New Zealand plants, to give one instance, have often a marked appearance of their own, and so have Chinese.

— RAISING PALMS FROM SEED.—The great demand for *Palms*, especially in a small state, makes the production of these a matter of some moment. Some raise their plants from imported seeds; others, who grow on a less restricted scale, purchase seedling plants on the Continent and grow them on into size until fit for sale. Those who raise from seed obtain their seeds from various parts of the world at all times of the year. Mr. F. BAUSE, of the General Horticultural Company's Melbourne Nursery, Anerley, raises annually a large number of *Palms*, and whether the species and varieties require warm or cold treatment all are treated alike in the matter of raising plants from seed. The seeds are sown as soon as received in pans and shallow wooden boxes; the soil used is turfy loam and a little sand, and the seeds are covered about an inch or so. In raising *Palms* from seed the great point is to get the seed as fresh as possible; and, if perfectly fresh when received, *Arecae* will germinate in six weeks, and *Cocos Weddelliana* in about the same time. *Euterpe clivis* is months in germinating. A few sorts lie in the soil longer than others. *Bactris* requires twelve months to germinate; one or two at a time will come earlier, and at intervals, but the bulk take the length of time named. *Elais guineensis* requires the same period before the cotyledons appear above the soil. The

principal Palms raised from seed in this country are:—*Euterpe edulis*, *Areca lutescens*, *Cocos Weddelliana*, *C. flexuosa*, *C. amara*; *Dactyloctenium*, *Geonoma gracilis*, *G. Schottiana*, *G. Scemmani*; *Thrinax elegans*, *T. parviflora*; *Kentia australis*, *K. Fosteriana*; *Caryotas*, *Lantana borbonica*, *L. rubra*, and *L. aurea*. The matter of potting from the seed-pans is one of some importance. Mr. BAUSE puts within a reasonable time after the plants are something like established in the seed-pans, but it is well not to pot too soon. Each plant is placed individually in a small pot. Some sorts show their peculiar leaf character sooner than others. *Lantana borbonica* will do this in from one to two years; *Geonoma* shows its character in quite a young state, and *Cocos Weddelliana* does the same. *C. flexuosa* not so soon. It is a practice full of interest to the grower to watch the gradual development of character in the young plants as they increase in size and vigour.

— CULTIVATION OF MEDICINAL PLANTS.—Great differences are known to exist in different species or varieties of the same genus as to their medicinal properties—a fact which every one familiar with the varying qualities of Apples and Pears will readily understand. The species of the large genus *Aconite*, for instance, differ very materially one from another in the quantity of aconitin they contain, and even in the quality and strength of that ingredient. For medicinal purposes it is especially desirable that, so far as possible, uniformity of strength in this and other drugs should be attained. With a view, therefore, to ascertain which particular variety is best for the purpose it is suggested by the *Pharmaceutical Journal* that space should be afforded at Kew for the cultivation on a sufficiently large scale of various species of *Aconite* and other medicinal plants, which it is not possible to obtain free from other species in commerce, to allow of chemical investigation of the quantity of the alkaloids contained in the various organs at different parts of the year. Such work is indeed quite legitimate for a botanic garden, and formed one of the duties of the old "physic gardens." The importance of determining the right variety is exemplified in the case of the *Cinchona*s, where at one time much time and money was lost in cultivating inferior varieties. It very often happens that two varieties, scarcely differing at all in external appearance, yet vary so much in chemical constitution that the one is practically useless, while the other is rich in some particular secretion which renders it of consequence for commercial purposes.

— CHILIAN PLANTS.—Since the publication of GAY'S *Flora Chiliana* (1845—1852) very many additional species have been discovered and described in various publications, so that in the absence of a reference catalogue of the species not included in GAY'S work great difficulty was experienced in determining whether a plant had been described or not, and if one had a name where it was published. Dr. F. PHILLIPPI, whose name is well known to those interested in the vegetation of Chili, has supplied this want. For his own use he drew up a catalogue of the names of all the Chilean plants that came under his observation, with references to the places of publication. This catalogue (*Catalogus Plantarum Fascicularium Chilensium ad huc descriptarum*) Dr. PHILLIPPI has now published, for which he deserves, and will receive, the thanks of botanists and horticulturists alike. In a short preface the author describes his work, which is an octavo of nearly 400 pages, and we cannot do better than extract a few notes therefrom. This catalogue, we are told, is only an enumeration of those plants recorded as Chilean in the works accessible to the author; and he has no doubt that many species are repeated under different names. Nevertheless, all the names are given, in order to bring them under the notice of botanists, and because the author has not access to the material necessary to decide numerous questions of synonymy. The species enumerated amount to 5358, of which 1939 are Polypetalæ, 1967 Monopetalæ, 245 Incompleta, 682 Monocotyledoneæ, and 255 Acotyledoneæ. A noteworthy feature in the flora is the presence of not a few monotypic genera, associated with others represented by many species. Thus there are 212 species of *Senecio*, 134 of *Adesmia*, 82 of *Oxalis*, 78 of *Calanthina*, 64 each of *Solanum* and *Chloroa*, 63 of *Carex* and *Valeriana*, 59 of *Baccharis*, 53 of *Haplopappus*, 51 of *Alstromeria*, 48 of *Viola*, 47 of *Plantago*, 43 each of *Eritrichium* and *Escallonia*, 41

each of *Gnaphalium*, *Verbena* and *Poa*, 40 each of *Ranunculus*, *Cristaria* and *Mutisia*, and others that count more than twenty species. Allowing for a considerable reduction in the number of species of some of the foregoing genera, in consequence of some of them having been described under more than one name, and others having been founded on too slender characters, it is evident that the vegetation of Chili, like that of South Africa and Australia, is very rich in forms.

— AUBRIETIAS AT CHISWICK.—Mr. BARRON has gathered together on the rockwork in the Chiswick Gardens quite a representative collection of *Aubrietias*, and very interesting they are; and as they have done well, and opportunity has lately been afforded for instituting comparisons and noting differences. There is the old *A. deltoidea* with its small pale coloured flowers; and by it *A. columneæ*, which appears to be identical with it. The variegated form of *A. deltoidea* makes a pretty rock plant, but it must be kept apart from the green-leaved varieties, or their stronger growth will speedily overpower it. *A. longinivilla*, introduced by Mr. ERNEST DENARY, of Erfurt, is of a pale purple colour, coming very near to *deltoidea*, perhaps a little larger in size. *A. Hendersoni* is of a pale violet hue, which appears to change quickly to lilac; it is yet a very useful form, and a marked advance when first distributed. *A. Campbelli* marks another advance in the ascending scale, reaching towards a heavier tint of violet; it is between violet and lilac; a pretty dwarf-growing form in the sense of being compact. *A. Eyrei*, though considered by some to be no improvement on *A. Hendersoni*, is yet a distinct advance, as the trial at Chiswick conclusively shows; it is of a deep lilac hue, the flowers large and well formed, and it makes an excellent mass. The new *A. violacea*, just certified by the Floral Committee, is also there, with its pretty violet colour well displayed, and here it takes on a great depth of colour. It is an undoubted acquisition, and marks the greatest advance yet made towards a true violet *Aubrietia*. *A. grandiflora* is a distinct form, pale lilac, with a white centre, the flowers not of such good form as others, and it has somewhat washy appearance; still it will be attractive to many. *A. crubescens* is a near approach to a white *Aubrietia*; in the warm sunshine the flowers come slightly tinted with pale lilac, in cool and moist weather it comes whiter; it is not much in itself, but it is of value as probably introductory to a better white. It is believed at Chiswick to be a Continental introduction. Mr. BARRON illustrates the wisdom of giving *Aubrietias* an elevated position and something good to grow in. They will stand any amount of heat and drought, as the dense cushions of foliage keep the soil cool and sustaining about the roots. A rich and somewhat gritty soil causes the young roots to run freely in it. In the case of established plants a top-dressing of fine rich soil thrown among the shoots is found of great advantage. If this can be done twice or thrice during the summer, so much the better. In planting in the open border it is well to give the *Aubrietias* something in the way of stones, potsherds, &c., to elevate the shoots above the surrounding soil. It is when *Aubrietias* are planted in low, cold, wet, clayey spots, that the plants come to grief under the presence of the rigours of autumn and winter.

— CHARCOAL MAKING IN KENT.—This is done to a large extent in the Hop districts of this county, in order to supply the heavy local demand for drying Hops in the time of the Hop harvest. The old Hop-poles are largely utilised for the purpose. To prepare them for burning they are broken into lengths of 3 feet each, and placed for burning in stacks, which are formed of "cords" of wood, as they are termed. Some of the larger stacks are made up of three or four "cords" of wood, and the burners are paid so much per "cord." In forming a stack for building, a hollow place is left in the centre, and then the lengths of Hop-poles are set up on end round this till the size required is obtained. It is usual to burn the upper parts of the poles only, leaving all the sound lower portions some 5 feet in length, in which form they are very useful for repairing hedges, &c. When these are too much decayed for this purpose they are burnt, but it is necessary to place the ends which have been dipped in creosote before being used with the Hops upwards, or they would not be consumed. They of course take a much longer time to burn through than do the un-

dipped portions. The heap, when ready for lighting, presents a thick mass of upright pieces of wood, the heaps varying in size according to the quantity to be burned, and is from 14 to 20 feet in diameter. A layer of coarse straw is then placed over the heap of wood, and over this a covering of rough sand, 2 inches or so in depth, is placed. A quantity of red-hot charcoal is then dropped into the opening in the centre, which ignites the wood, and then the opening is covered over. The fire, therefore, proceeds from the centre to the circumference, and it occupies from a day and a half to three days to thoroughly char the mass. When sufficiently cooled it is cleared away into a shed ready for use, and another heap is formed, till all that is required to be burned is exhausted. The work is done by professional charcoal-burners, who take a kind of circuit, itinerating in various parts of the country. The best charcoal is made of roots of trees, but a longer time is required to convert them into charcoal—what is known as "dead wood"—that is, the branches of trees that are cut out to thin them, or blown down by the wind, and Hop-poles. The straw becomes thoroughly charred, and, being mixed with the calcined sand and small pieces of charcoal, makes an excellent manure for Onions, Turnips, &c. It is not unlikely that this charred sand and charcoal would prove an excellent ingredient for *Auricula* soil. There can be nothing injurious in it, being mainly composed of the finer particles of the charcoal; and the sand must be better after being burnt than before. Some of this sand will be used by an *Auricula* cultivator in his potting compost this summer, and it will be interesting to know how it answers. It would not be difficult to obtain some fine charcoal for potting purposes from some of the Kentish homesteads, as the Hop-dressers do not care to use the fine among it, and prefer the coarse. The remains of a store-heap have to be sifted, and the siftings supply *Auricula* cultivators with what they appear to require to keep their soil porous and sweet.

— ANEMONE CORONARIA ALBA.—We have received from MESSRS. PETER VAN VELSEN & SONS, of Haarlem, some flowers of a pure white variety of *Anemone coronaria*, which are remarkable for their size, substance, and purity of colour.

— THE WEATHER.—General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending May 8, issued by the Meteorological Office, London.—The weather, though finer in the south-west than elsewhere, has been generally cloudy, rainy, and unsettled. Thunderstorms occurred in many parts of the kingdom on the 3d, and again at several stations towards the close of the period. The temperature has been slightly above the mean in the east, south, and south-west of England, and about the average in the "Midland Counties," but in all other places it was a little below. The maxima over southern England were rather high, a reading of 71° being recorded in London and of 70° at Stratfield Turgis on the 3d. In other districts the maxima varied between 69° and 68°. The minima were as low as 31° in "Ireland, N.," and between 32° to 35° in most other districts; but in "England, E.," the thermometer did not fall below 39°; in "England, S.," 37°; and in "England, S.W.," 36°. The rain-fall has been equal to the mean in "England, N.W.," and rather less in "Ireland, S.," but in all other districts the fall was in excess of the average. Bright sunshine shows a slight increase in most places, the percentages ranging from 28 in "England, N.E.," to 58 in "Ireland, S." Depressions observed.—Pressure over our islands has been more uniform than of late, and the changes comparatively slight. Numerous small depressions have travelled slowly in an easterly direction, causing the wind, which was generally light or moderate, to be very variable in direction.

— GARDENING APPOINTMENTS.—W. C. LEACH, for seven years Foreman to the late Mr. INGRAM at Alnwick Castle, and for the past three years Gardener to F. TOWNSEND, Esq., Honington Hall, has been appointed Head Gardener to G. H. ERINGTON, Esq., Laxden Park, Essex.—Mr. C. BUCHANAN, Gardener, Penicuik House, N.B., has been appointed Clerk on the Penicuik estates of Sir GEORGE CLERK, Bart., in succession to Mr. C. FRANCE, who succeeds Mr. DANGERFIELD as Factor on the Stone estates of the Earl of Mansfield.

RABY CASTLE, DURHAM.

This grand old monument of Border architecture was built in times when defence was the matter of greatest importance, when first thought was yet unborn of that terrible compound against which in later days the thickest walls are full as spiders' webs; yet, with raiders' attacks ever in view, the builders of these old castles well knew how to combine strength with fair appearance, as evidenced by such parts of the original as still remain. Amongst all these old castles in the northern counties there are none of more noble appearance, and few in which additions or repairs needful to make good the inroads of time have been carried out in better keeping with the older parts.

Raby is situated some 10 miles from Darlington, standing within an angle formed by that town, Barnard Castle and Bishop Auckland, 8 miles from the latter and 6 from Barnard Castle. The approach by the principal entrance is from the quaint old village of Staindrop, about a mile distant, and from which a well-kept carriage drive winds its way through the beautifully wooded park, which is over 900 acres in extent, enclosed by an 8 feet high stone wall.

There are two other entrances to the park at points opposite to the principal approach; one of these is on the Bishop Auckland Road, where there also is a lodge. A better idea may be given of the extent of the magnificent grounds enclosed within these walls by mention of the 15 miles of roads and paths there-in, than by a mere statement of the acreage. With a passing glance at the old church, which stands in the village where repose many who, in their time, have held sway at Raby, we pass through the gates, and follow the road already mentioned. The park here, in common with the surrounding district, has been so favoured by Nature with those easy undulations without which all that Art can do fails to give to the landscape the desired effect. There is enough diversity of surface in the land, yet an absence of the abrupt ascents that make locomotion toilsome.

To the left of the drive leading from the Staindrop entrance stands the Bath Wood, which takes its name from the bath here existent that has been formed by enclosing a beautiful spring, the water of which is unusually clear. There is an additional room besides that which encloses the spring. The grounds in this part have been well laid out, and are nicely planted with shrubs and trees of modern introduction that contrast well with the fine native timber at hand on every side. There is here also fronting the bath a piece of water that from its position in this silent hollow adds much to the general effect. The trees of which this wood is composed mostly consist of Beech, Elm, and Sycamore, which thrive well, the rich loam resting on a subsoil free from stagnant moisture favouring that healthy growth which is unmistakable in the bright smooth bark and tall thick trunks of the Beeches in particular. Leaving the grateful shade of the wood, and again following the drive, which from this point follows a more direct course to the Castle, a conspicuous object presents itself—a handsome piece of water about to acres in extent; the road divides the higher from the lower portion of this miniature lake, the existence of which, according to local tradition, I believe, is ascribed to the stone of which the Castle is built having been quarried here. This water extends to the south side of the Castle, right up to the battlement wall that encompasses the building, around which was a mote, a portion of which has been filled up; but much still remains. In all probability the water required to fill the moat was obtained from this lake. The effect from this point, with the Castle fall in sight, of the ever-varying surface of the land, handsome masses of trees, the broad open glade in which are grazing hundreds of red and fallow deer, the whole relieved by more extended views stretching far and wide into the surrounding country, is such as few parts of the kingdom can boast. To the left of the carriage road there rises a long ridge of ground running westwards, which is occupied by a grand lot of Beech trees, old but still thriving, with tall clean stems, as straight as gun-barrels, and bark as smooth as saplings. This elevated ridge extends for some 600 yards in length, and is a commanding feature of the park. I may here remark, that in the park at Raby, as in the grounds attached to many more of the old baronial residences existent in various parts of the country, the great mistake of over-planting, so common in places of more modern date, has not been committed. Here, the broad open spaces, picturesquely irregular in their outline, stretch

out boldly, and have been spared the infliction of dotting the surface with little groups and odd trees that are objectless, except to show that the planters were disposed to do something, even if their work defaced the object which it might be supposed they had in view, in providing the needful shelter and shade to embellish the ground, but not hide its beauties by blocking the views from anything beyond distances wholly insufficient. Still following the carriage road, which, from where it crosses the piece of water already described, winds round through a grove of fine trees, standing sufficiently far apart to admit of their healthy existence for a dozen generations yet to come, we reach the porter's lodge. From this point the land descends somewhat in the direction of the garden, beyond which it again gradually rises towards the extremity of the park in this direction, which is bounded by the North Wood, that is 2 miles long. This wood occupies ground considerably higher than the Castle, and gives grateful shelter from the keen north winds that come sweeping across the open country in these elevated districts in a way that those who live in warmer localities little understand.

Approaching the immense pile of building, occupying within the outer wall a space of over 2 acres, it literally looks to be crowded with towers possessing enormous strength. A portion of the building is supposed to date from the twelfth century, but the greater part some two centuries later. The whole is in excellent preservation, material and work alike having so far defied the wasting influence of time through the long ages it has stood that the walls look little the worse. Passing through the porter's lodge, standing in the outer wall—and which, like the rest of the noble pile to which it leads, has well withstood the wear-and-tear of time—from this we make for the south front, an inspection of which gives even a still clearer idea of the extent of the building. Looking southward from here there is a splendid view in the direction of the adjoining county of York, over Richmond, which town is 16 miles distant. From the eastern front of the building the views in the Cleveland direction are equally fine. On the walls of the Castle at short intervals Ivy is growing with the vigour that good soil and a genial position usually give; this fine old plant is seldom out of place, but never less so than when clothing an ancient building like this. It is not suffered to encroach so far as to hide too much of the walls, or to form a continuous covering, but is kept within bounds, each mass being separated from its neighbour by a bare space. The outline of each space covered is kept cut-in irregularly so as to give it a natural appearance. The scarlet *Tropæolum speciosum* is also planted in several places at the foot of the walls up which it is trained, growing luxuriantly, and producing flowers in abundance. It attains a height in this northern part of England which it rarely does in the south. I may here mention that the building stands within a comparatively short distance of the eastern confines of the park, which in this direction is bounded by the Bishop Auckland Road. The principal entrance to the Castle is at the west side, where there is a passage to the courtyard, across which there is a doorway of unusual proportions; by this is reached the entrance-hall, which has a carriage-way right into the interior of it. This hall, in keeping with the rest of the vast fabric, is of enormous size, with a beautiful arched roof. A detailed account of the interior of Raby and the treasures it contains would be out of place in a notice which has no pretensions beyond a brief description of the garden and grounds adjacent, further than to mention its lofty rooms, appropriately furnished and replete with works of art, among which is the well known statue of the "Greek Slave," by Power. On the walls are numbers of fine pictures, amongst them being many portraits of the family and others. The baronial hall is 126 feet long by 36 feet wide. *T. F.*

(To be continued.)

THE PURPLE BARBERRY.—As an ornamental foliage shrub this striking variety of *Berberis vulgaris* would be well worth growing. When, however, its profusion of racemes of pale yellow flowers, followed by its crop of pretty fruits, are taken into consideration, it will be seen that its claims for admission into a shrubbery of even very limited extent are well founded. Besides, like the ordinary green-leaved form, it requires no care or attention beyond preventing other shrubs of larger growth from choking it.

CULTIVATION OF USEFUL PLANTS IN SAN DOMINGO.

In a recently issued report by Major Stuart on San Domingo it is stated that the cultivation of the Sugar-cane may now be considered an established industry in the district of Porto Plata. There are already five large plantations in bearing, with mills of the most approved construction. The area of many of the old plantations is being enlarged, and new ones are marked out for immediate clearing. The cultivation of the Sugar-cane is, however, not the only agricultural industry that has lately begun to flourish in this district; Cocoa, Coffee, Tobacco, are also produced in continually increasing quantities, having each a good surplus for exportation after liberally supplying the home trade for local consumption. Previous to the recent introduction of the Sugar-cane, Cocoa, and Coffee, Tobacco formed the staple produce of the country, and its chief medium of commerce. About 12,000 quintals was annually exported, nearly all of which was sent to Bremen, the chief market for the produce of Porto Plata. In 1878 or 1879 the consignees at Bremen wrote to their correspondents in Porto Plata that they would accept no more consignments of Dominican Tobacco, as owing to the want of proper care in the cultivation of the plant, and in the preparation of the leaf, it could not be sold unless at a heavy loss. This announcement produced a widespread consternation in the country, for it seemed to threaten both growers and exporters with ruin. Happily the remedy was at hand. A good many Cubans were in the country who understood the Cuban mode of cultivating and preparing Tobacco; they were applied to by the Dominican growers, and the fruits of their instructions were the exportation from Porto Plata alone of 40,000 quintals in 1880, and 100,000 quintals in 1881, of prime Tobacco.

Dominican Tobacco is now in demand, at good prices, not only in Bremen, but also in Liverpool, Havre, and New York. Its cultivation is carried on in the southern districts, as well as in the north, and on a yearly increasing breadth of land, while both in the north and south factories are already established for the manufacture of cigars and cigarettes under the superintendence of Cubans of experience. Of these manufactures there is already a very considerable exportation, with every prospect of increase. In fact the Dominicans aim at competing with the Cubans in the finer sorts of Tobacco, and as they possess the same advantages of soil and climate there is no reason why, with equal skill and care, they should not succeed.

Major Stuart further writes as follows:—

"All that I have said about the progress of agriculture in the north applies in every particular to the south, but in a much larger sense as regards Sugar. On the lands lying back from the capital, and along the banks of the lower Ozama, numerous cane plantations are now established, each complete with mill and all the stock and requirements for the production of sugar. There are already twenty-three of these plantations within a radius of a few miles round San Domingo city, and it is not intended that the number should rest there. When I visited San Domingo for the first time, in the fall of 1875, none of these plantations existed, but one—the first in the country—was in course of clearing, and workmen were engaged in putting up the mill. Last year, I may add, a system that promises well was tried of inducing small holders in the neighbourhood of plantations to raise canes on their lands, and sell them in a raw state to the millowners. The cultivation of Coffee is also in a promising condition in the Dominican country. Congenial soil and climate for it are found without difficulty in various places, but chiefly at present on the heights above Azua overlooking the Bay of Ochoa, a deep inlet that divides into nearly equal parts the south coast of the island. Here a small Coffee plantation was established in 1877 by President Gonzalez on his paternal lands. It succeeded so well that others hastened to follow the example, not only in the neighbourhood of Azua, but also in different parts of the country. The little tree is tended and dressed with proper care, and so rapidly has the cultivation extended that even now Dominican Coffee appears in its own name on foreign markets, and is quoted, I have been told, on a par with that of Jamaica. The quantity exported is still comparatively small, but it increases with every season. Until 1878 Coffee was imported into the country, for the Dominicans are a coffee-drinking people, and now it is the surplus left after the supply for home consumption that is sent out of the country."

The next production to be noticed is the Cacao or Chocolate tree. This tree is of recent introduction into the Dominica country. It has taken very kindly to the soil, and being cultivated with care it yields abundantly, and the kernel is of good quality. Cacao now figures well among the exports of the country, with an annual increase which keeps pace with that of Sugar and Coffee.

MANURES AS ABSORBENTS OF WATER.

By A. STEPHEN WILSON.

I AM not aware that any complete theory of a manure has yet been laid down; nor do I propose entering upon the labour of laying down such a theory. My present purpose is to show, from experiments made by me, that manures perform a certain office in addition to that of directly supplying plants with the food contained in their own substances. The office to which I refer is that of absorbing moisture from the atmosphere—a function which may be called hygroscopion (*Augras*, moist, and *serbois*, I drink up). Now, it would seem obvious that if in a dry season a given manure has the capacity of absorbing moisture from the atmosphere more copiously than the soil in which it is mixed, the roots of plants growing in that soil and manure will be better supplied with water than if the manure were absent. And if, of two manures, the hygroscopic power of the one is greater than that of the other, a plant growing in the more hygroscopic will be better supplied with water than a plant growing in the less. But the results will be better seen after the experiments have been detailed.

Some trials of a rough kind were first made in search of suggestions. Two small flower-pots were filled with soil; two were filled with the same soil mixed with finely ground Cambridge coprolite; two with soil and dissolved coprolite; and two with soil and guano. The pots were accurately weighed and set beside each other in the evening in a garden walk. In the morning it was found that the soil alone had gained 47 grains; soil and ground coprolite, 42 grains; soil and dissolved coprolite, 60 grains; and soil with guano, 54 grains. This comparison was carried on for twelve days; but the conditions were seen to be very defective. The pots were of equal size, but possibly varied in porosity. The soil and the manures at the outset were just taken as they came to hand, and therefore may have contained, to begin with, varying percentages of moisture; then slight showers occasionally fell, while the wind may have carried off from some of the pots a few particles lying on the surface. The results were, therefore, of no value, except to indicate certain precautions necessary to secure scientific facts, and need not be here given.

FIRST SERIES.

Garden soil, ground coprolite, dissolved coprolite (superphosphate), and guano were then taken, and all sun-dried, though not completely. Small stoneware jars, all of the same size and shape, were then filled with as nearly the same degree of compactness as could be attained. They were then set upon a platform in a tray containing water, and the whole enclosed with a large glass bell to confine the evaporation. The results were as under:—

1881.	I.		II.		III.		IV.	
	Earth.	Ground Cam. Coprolite.	Ground Cam. Coprolite.	Dissolved Cam. Coprolite.	Guano.	Guano.	Guano.	Guano.

Weights were made every day, but as they harmonised throughout only as many are given as to show the general results. From May 28 to June 8 the earth lost 25 parts from 1000, the ground coprolite gained 14 parts, the dissolved coprolite gained 39 parts, and the guano gained 80 parts. Undoubtedly had the jar of earth stood in the water-closed bell alone it would have gained weight, but the absorptive power of the dissolved coprolite and guano immediately beside it caused a still further drying of the less absorptive soil; and this result shows that such manures in a comparatively dry soil will attract towards their particles the moisture in the surround-

ing soil, and therefore become more rapidly liquified and available for roots.

SECOND SERIES.

But the conditions under a glass bell were somewhat artificial. I next thoroughly sun-dried quantities of earth, cow-dung (pulverised), ground coprolite, dissolved coprolite, potato manure, and guano. They were all in a state of fine division. Cups and pans corresponding with each other in size and surface were filled with the various manures, and the surface struck off with a straight-edge. It would have been possible to have put the same weight into the competing jars, but this would have necessitated different degrees of compression, and it was therefore resolved to compare equal bulks exposed with equal surfaces. The cups were of different sizes, the same numbers (1, 2, 3) in the table being of the same size. The whole were placed in a large tray and set in the floor of a disused milk-house.

" 6	102	102	107	108	103	103	103	102	105	107	104	112	116	108	111	105
" 8	102	102	109	109	103	103	103	106	108	105	118	125	111	115	110	107
" 10	102	102	110	110	103	103	103	107	108	106	126	135	115	111	117	110

Thus between June 3 and 10 the earth had gained in each cup 2 per cent., the cow-dung 10 per cent., the ground coprolite 3 per cent., the dissolved coprolite 6, 7, and 8 per cent., in the respective cups; the potato manure 26 per cent. in one cup and 35 per cent. in the other, and the guano had gained in one cup 10 per cent., in another 15, and in the third 19 per cent. The gain is greatest in some of the small pans, simply because the absorbing surface exposed to the air bears a greater proportion to the weight of manure in the pan in the smaller pans than in the larger. Where there is little absorptive force the difference is small.

It is seen from the figures that the earth has less absorbing power for atmospheric moisture than any of the manures compared with it. The next lowest in this power is the ground coprolite, then follows the dissolved coprolite, absorbing twice as much moisture as the ground coprolite; then comes the cow-dung or farmyard manure, absorbing rather more than the dissolved coprolite; next follows the guano, with a still higher absorptive power; and lastly comes the potato manure, taking in from the air nearly four times as much water as the superphosphate.

These results are not at all meant to give absolute factors of hygroscopic power, but merely to show that this power varies greatly in different manures. For permanent comparisons probably a standard cup would have to be adopted with various other fixed conditions; but into this point I need not here enter.

THIRD SERIES.

The manures for the third series of comparisons were completely sun-dried and pulverised, and turned over in a current of air under bright sunshine till all the moisture which could be driven off in this way

was got clear of. The pans were then loosely filled, and the surfaces evenly struck off. For each kind of manure there were two pans of different sizes; all the No. 1 pans being largest and of the same size, and all the No. 2 pans being also equal to each other. They were then placed in a tray and set in the floor of an

outhouse. The door and window permitted a constant current of air over the pans; but they were completely protected from all rain. They were exposed from June 13 till July 30, and were weighed sixteen times. Seven of these weighings are given in the annexed table. The weights of dry manure are made 100, and the increase in each case is reduced and stated per centively as before.

Notes were kept of the state of the weather, which was sometimes dry and sometimes wet, but not much rain fell during the time under notice, so that the air was in an average state of saturation. It was not thought fit to continue the experiment longer, because large crops of mould began to show themselves on some of the pans, especially those containing the Turnip and Potato manures; and, as many fungi have a strong affinity for moisture, further results would have been vitiated.

The manures are placed in the table in the order of their absorptive power, and it will be seen that the

soil has absorbed 3 per cent., the ground coprolite 5, the cow-dung 16, the dissolved coprolite 25, the Challenge manure 37, the Turnip manure 39, the guano 53, and the Potato manure 92 per cent. The earth, under the conditions of atmosphere which here affected the experiment absorbed in a few days all the moisture it was capable of withdrawing from the air, and the ground coprolite behaved in a nearly similar manner. The cow-dung after July 15 gave off a little of the water it had up to that date absorbed. The superphosphate continued absorbing at a diminishing rate up to the end. The Challenge manure, Turnip manure, guano, and Potato manure, also went on to the end adding to their water, at a rate, upon the whole, gradually diminishing, the guano having added about one-half to its weight, and the Potato manure having nearly doubled its weight.

(To be continued.)

LIST OF GARDEN ORCHIDS.

DENDROBIUM.

(Continued from p. 528.)

- 175. *D. PARADOXUM*, Teijsm. and Binnend., *Nat. Tijdschr. Nederl. Ind.*, xxiv., reprint, p. 12.—Sumatra. Buitenzorg Botanic Garden, 1862. Flowers 2 inches long, greenish.
- 176. *D. (DEIDILION) PARVUM*, Rehb. f., *Gard. Chron.* 1866, p. 1042; *Xenia*, ii., p. 164, t. 169.—Birma. Discovered and introduced by Rev. Mr. Parish for Messrs. Low, with whom it flowered in 1866. Small greenish flowers.
- 177. *D. PARMITH*, Rehb. f., *Bot. Zeit.* 1863, p. 237; *Bot. Mag.*, t. 5483; *Xenia*, ii., p. 140, t. 152; Jennings, *Orch.*, t. 39.—Moulmein. Discovered and introduced by Rev. Mr. Parish for Messrs. Low, with whom it flowered in 1863. A handsome species of the *D. noble* type, having almost

- wholly purple flowers, with a deeper coloured disc to the labellum, which is also very downy. Hort. Kew.
- D. PAXTONI*, Paxt. Mag., = *D. fimbriatum* var. *oculatum*.
- D. PAXTONI*, Lindl. = *D. chrysanthum*.
- 178. *D. (HOLCHRYSA) PERULA*, Rehb. f., *Hamb.*

Gartenz., xxi., p. 298.—Assam, India. Imported by Mr. J. Day about 1874. Flowers small, sulphur-yellow, streaked with orange.

179. *D. (DENDROGROBYN) PETRI*, Rehb. *f.*, *Gard. Chron.*, n.s., vii., p. 107.—*Polystea* or *Australa* (?). Introduced by Mr. Peter Veitch. Flowers white, in erect racemes.
180. *D. PHALANOPSIS*, Fitzgerald, *Gard. Chron.*, n.s., xiv., p. 38.—North Australia and New Guinea. Flowered by Captain Broomfield in 1880. Allied to *D. superbiens*, but the sepals not waned. Flowers lilac, 2–2½ inches in diameter.
181. *D. (PHELODENDRON) PICTUM*, Rehb. *f.*, *Gard. Chron.*, 1862, p. 548.—Borneo. Discovered and introduced by Mr. Hugh Low, and flowered in the nursery of Messrs. Low & Co., Ceylon. "Nearly allied to *D. aureo-roseum*. Sepals pale rose, petals and lip white, richly painted with deep crimson veins."
182. *D. (EUPHORBIA) PIERARHI*, Roxb., *Veitch Gard. Cat.*, p. 63 (*Boenm hantua*). Hook., *Exot. Flor.*, t. 1, p. 103, t. 2, p. 234; Lodd., *Bot. Cab.*, t. 750; *Bot. Rec.*, t. 1, p. 175; *Flore des Indes*, t. 1, p. 955 (var. *fulvifolium*).—Chittagong, India. Flowered in the Liverpool Botanic Garden about 1825. Sepals long and slender, bearing delicate transparent flowers throughout their entire length. Flowers pale rose, with a yellow lip. Some varieties are much more highly coloured than others. Hort. Kew.
183. *D. PLANIBULBA*, Lindl., *Bot. Reg.*, 1843, Misc., n. 79; *Hort. Acclim.*, vi., p. 80.—Manilla. Imported by Mr. Cumming and flowered by Messrs. Loddiges. A singular species, of small stature, and having small white flowers veined with purple.
184. *D. (BOIROTUM) ELICATILE*, Lindl., *Bot. Reg.*, 1846, Misc., n. 7; *D. puberulum*, Lindl., *Bot. Reg.*, 1846, Sp. Orch., p. 79, t. 1, p. 103. Imported by Messrs. Rolleston. Flowers large, solitary, dull yellow, tinged with red; labellum
185. *D. (EUPHORBIA) PRÆCINCTUM*, Rehb. *f.*, *Gard. Chron.*, n.s., vii., p. 750.—Imported by Messrs. Veitch with *D. devonianum*. "Flowers scarcely exceed ½ inch in length, of a pallid ochre colour; lip sulphur-yellow, orange in front."
186. *D. PRIMULIUM*, Lindl., *Gard. Chron.*, 1858, p. 400; *Journ. Linn. Soc.*, iii., p. 12; *Regel. Gartenflora*, x., t. 336; *D. nobil. var. pallidiflorum*, *Bot. Acclim.*, v., p. 500; Sikkim, India. Allied to *D. nobil.* and *D. cucullatum*. Flowers solitary, white, tipped with rose, and a yellowish downy labellum. Hort. Kew.
187. *D. (EUPHORBIA) PULCHERIMA*, Roxb., *Lindl. Gen. and Sp. Orch.*, p. 62; Lodd., *Bot. Cab.*, t. 1, p. 103; *Manil. Bot. Soc.*, t. 1, p. 103, t. 2, p. 507.—Sihet, India. Cultivated and flowered by Loddiges in 1833. This is referred to by Reichenbach and others as a variety of the same species as *D. devonianum*, but as it already possesses a distinctive name, and looks so different I keep it apart here. Although very beautiful it is by no means so grand a plant as *D. devonianum*, from which it differs in its more decumbent habit, much shorter, broader leaves, and in the smaller, nearly circular, shallowly lobed, golden-yellow disc, not two large separate blotches. Hort. Kew.
188. *D. PRINOSUM*, Teijsm. et Binnend., *Nat. Tijdschr. Nederl. Ind.*, xxiv., reprint, p. 10.—Moluccas. Puitenzorg Botanic Garden, 1862. Inconspicuous.
189. *D. PURPURESCENS*, Teijsm. et Binnend., *Nat. Tijdschr. Nederl. Ind.*, xxiv., reprint, p. 10.—Java. Puitenzorg Botanic Garden, 1862. Inconspicuous.
190. *D. (PYNOSTACHYUM) BENTH.* PURPUREUM, Roxburgh, *Flore Indica*, iii., p. 484; Miq., *Choux de Pé*, *Gard. Bot.*, 1870, t. 1, p. 20, fig. 1.—Moluccas. Cultivated in the Botanic Garden, Calcutta, at the beginning of the present century, and at Puitenzorg in 1866. A very distinct and curious species, of which I have seen no specimens. It has long stout stems and small flowers, something like those of *D. secundatum*, but much smaller, crowded together in spherical, sessile clusters.
191. *D. PYNOSTACHYUM*, Lindl., *Journ. Linn. Soc.*, iii., p. 19.—Moulmein. First discovered by Mr. Thos. Lobb, and subsequently introduced by the Rev. Mr. Farguhar, who sent it to Kew in 1866.
192. *D. PYSMALIUM*, Lindl., *Gen. and Sp. Orch.*, p. 82.—Siam. Puitenzorg Botanic Garden, 1869. Inconspicuous.
193. *D. QUADRANGULARE*, Parish, MSS.—Flowered at Kew in 1871.
194. *D. RABIANI*, Rehb. *f.*, *Venia*, iii., p. 130, t. 1, p. 116.—Borneo. Discovered and introduced by Mr. Hugh Low, for Messrs. Low & Co., of Upper Ceylon.
195. *D. RAMOSISSIMUM*, Wright, *Et. Pl. Ind. Or.*, t. 1, p. 168; *Journ. Linn. Soc.*, iii., p. 15. Ceylon, India. A small shrubby and branching species. Flowered at Kew in 1872.
196. *D. ELIACRATUM*, Teijsm. et Binnend., *Nat. Tijdschr. Nederl. Ind.*, xxiv., reprint, p. 11.—Sumatra. First seen in the Botanic Garden, 1866. Inconspicuous.
197. *D. (EUPHORBIA) PULCHERIMA*, Lindl., *Bot. Reg.*, 1846, Misc., n. 110; Lindl., *Bot. Reg.*, 1846, Misc., n. 110; Lindl., *Bot. Reg.*, 1846, Misc., n. 110; Lindl., *Bot. Reg.*, 1846, Misc., n. 110; Singapore. Introduced by Mr. Cumming, and cultivated by Messrs. Loddiges in 1840. Flowers straw-coloured, not very pretty.

(To be continued)

HOME CORRESPONDENCE.

Dinner to Mr. Thomas Moore.—Although invitations to the dinner to be held at the Cannon Street Hotel on May 23 have been sent to all who have subscribed to the presentation fund, as well as to those members of the committee who have not subscribed, I think it desirable to guard against possible misunderstandings by way of this final note. The dinner will be served at 6.30; Dr. Masters, F.R.S., will preside. The charge to each guest will be 21s. Evening dress is optional. To the country cousins whom the Royal Horticultural Society's exhibition may bring to town, we say, "Don't trouble about evening dress, but come as you are." But notice in advance is particularly requested, because of the necessary marketing, cooking, &c. *Shirley Hilliard.*

Shrubs for Town Planting.—With reference to the letter on shrubs for town planting, inserted in your journal for May 6, I would suggest that a trial might be made of *Salixia adiantifolia* and the two kinds of *Catalpa*. I think both would grow in the smoky atmosphere of London, and, if so, they would be highly ornamental. *John Colebrook.*

Lawn-edge Cutters.—Some time ago we introduced to the notice of our readers, a valuable implement for hedge-clipping, introduced by Mr. Ridgway, of Macclesfield, and which has met with favour. Mr. Ridgway has lately been trying his hand at the invention of a simple machine for cutting lawn-edges, and has succeeded in producing a capital instrument, illustrated in fig. 100, and which having tried we are pleased to be able to report satisfactorily upon.

FIG. 100.—RIDGWAY'S LAWN-EDGE CUTTER.

Every gardener knows what a tedious, back-aching job lawn-edge cutting is—here is a tool that is worked with ease, and with an expedition that all will appreciate.

New Melons.—As the distributors of Best of All Melons we take exception to the judgment of your correspondent, Mr. Carmichael, in his note on new Melons (p. 602), wherein he describes "The standard of flavour in Best of All is not nearly high enough." Had your correspondent given a qualified judgment, by saying it was his experience, we should not have taken exception to it, but to condemn the Melon so strongly does not accord with the hundreds of leading gardeners who have grown this variety for the last two years, and have given their opinion of its merits as one of the finest flavoured Melons in cultivation. To confirm the opinions of so many cultivators we may mention that at the Great National Fruit Show held here last August we exhibited several fruit on our stand, and cut one or two for the opinion of several horticulturists, amongst which we may name Dr. Hogg, Mr. Penny, Mr. W. Sneed, Mr. J. Eastwood, &c., who declared it was the best flavoured Melon they had tasted. *Dickson, Brown & Tail, Manchester.*

Aucubas.—How grand these are this year, the winter having just suited them. As there has been no frost to injure the berries, they set with great freedom, and are now glowing on the bushes like coral, the colour being perfect, and in fine contrast with the rich spotted leaves by which the large clusters are backed. Seen as Aucubas are at present, so full of fruit, no shrub can be more ornamental, and the wonder is, that numbers of males are not planted to supply pollen, for if that were done it would be distributed by the air and bees, and the blossoms on females would be fertilised without any trouble. Our plants are some distance from each other, and yet the females are full of fruit, which may in part be accounted for by the quantity of males we have about, so that in whichever direction the wind is it carries some pollen. The best way, however, is to plant

both male and female pretty close together in sheltered, sunny spots, as there the flowers not only show and set more freely, but the berries do not get knocked about and damaged in the manner they are liable to when in more exposed situations, where the fruit often gets so much bruised as to turn it quite black. Those who are not so fortunate as to have male plants should at once obtain some in pots, or get pollen and artificially fertilise, as the pollen will travel and keep in an ordinary wooden pill-box, and may easily be applied to the stigmas of the blooms by means of a soft camel-hair brush, very slightly moistened in honey or sugar-and-water, to make it a little sticky, and so cause the pollen grain to adhere. Although there are now many varieties of Aucubas that have been obtained from seed, none are more showy than the old *A. japonica*—the common spotted kind, that has been known so long—as the contrast between the foliage of this and the berries is both striking and pleasing. Some two or three, however, are remarkable for their fine leaves, and are worth growing on that account, the best being *A. longifolia* and *A. michauxii*; but the seedlings, which any one may raise by sowing the berries, mostly vary, and yield about an equal percentage of males and females. The seed germinates most readily when sown in sharp sandy soil, where it should be covered by a handlight, or protected in some way from birds and mice, which devour it is just as it is beginning to grow. The berries require no washing to get rid of the pulp, as that soon rots away in the earth, and they may, therefore, be sown as they are any time now, as they are ripe and will soon fall from the bushes. *J. S.*

Nerium Oleander.—It may perhaps interest some of your readers to know how well this fine old plant flowers after being planted out in summer. We have now some grand plants against the back wall of our second vinery, which are covered with large trusses of bloom. We planted them out in June in a sheltered situation facing the south, and gave them plenty of weak liquid-manure while making their growth, and secured the canes from being broken by wind. They were lifted and re-potted in the autumn, and tied up against the back wall of the vinery, where they are now displaying their beauty to great advantage. They are valued here much for cutting, to be mixed with such flowers as *Stephanotis*, *Eucharis*, &c. I enclose a truss for your inspection. The plants are only three years old, and have from twenty to thirty trusses on each. *Fred. Thomson, The Gardens, Norman Court, Salisbury.* [Very fine, Ed.]

Wistaria sinensis.—As "H. L. C." wishes to know if there is a larger *Wistaria sinensis* in the country than the one at Luscombe Castle, South Devon, I beg to send you the dimensions of one at Oakwood, Chichester, Sussex. It is planted in the angle of the greenhouse and garden walls. The longest branch on the top of the garden wall eastward is 110 feet; six branches on the south front of the garden wall east, are 15 feet long each; two others are 10 feet long each; another branch on the top of the chimney measure 6 feet; another branch on the top of the back wall of the greenhouse westward is 27 feet, and one on the north of the back wall of the greenhouse 23 feet, making in all a total of 284 feet. It is now in bloom, and can be seen by any one who would like to call. Oakwood is about a mile from the BASHAM Railway Station on the Brighton and Portsmouth South Coast line. *G. L., Oakwood.*

The Black Italian Poplar is, no doubt, deserving of much of the praise bestowed upon it by your correspondent, Mr. Rust, at p. 602, except as regards the particular quality for which he recommends it the most. It is evident Mr. Rust has had no experience of the Canadian Poplar (*Populus canadensis nova*), or he would have hesitated before pronouncing the Black Italian variety as the fastest growing tree we have. In this respect it must give pre-eminence to the Canadian variety, which is altogether a great improvement, is more vigorous in growth, has larger and denser foliage, which is retained till quite late in the autumn. It is a very handsome tree, well adapted for planting wherever the Black Italian Poplar is considered to thrive. It is a most satisfactory tree to plant in exposed situations and in smoky neighbourhoods. *G. Z.*

Gentiana acaulis.—I am glad to see that one nurseryman at least has a good stock of this lovely Gentiana, and hope, now that attention has been called to its great beauty and usefulness as an edging plant, that many will be induced to try it, as I feel sure if they do they will be greatly pleased with the result. There is no doubt it must be largely grown from seed, as a dried root [? of *G. lutea*] is used for making decoction to be taken as a tonic, but not so much now as formerly, when quinine was less known. I see that the writer of the notice of the *Gentiana acaulis* at Slough speaks of the plant as growing in the shade; but my experience of it is that it requires sun, as it

is only under the influence of the solar rays that it opens its blossoms, which mostly turn south, and remain leaning that way. *J. Sheppard.*

The Alexander Peach.—I can fully endorse all that Mr. Rivers has said in favour of this Peach. It may be of interest to those who may be contemplating planting it, to know that last season I fruited it on the open wall, where it ripened its fruit quite a fortnight earlier than the earliest kinds growing in an unheated Peach-house. This season I have removed my tree into the Peach-house, having, after many trials, reluctantly arrived at the same conclusion as Mr. Rivers—that Peach growing in the open air is almost hopeless. *Chas. Meenan, The Gardens, St. Clare, near Ryde.*

Salvia patens.—This is a very useful, showy, and easily cultivated greenhouse plant; it is also an attractive bedding plant either planted in masses or in mixed beds, but it is as a greenhouse or conservatory plant that I shall now refer to, and for the embellishment of which, on account of its beautiful soft blue flowers—a colour peculiar to itself—it has few equals. Cuttings put in now singly in 3-inch pots in light sandy soil and placed in a Cucumber or Melon frame will root quickly, and by repeated shiftings into larger pots, as they require more room at the roots, and stopping of the shoots, and plenty of air and water at the roots, when necessary, will make useful flowering plants by the autumn. *H. W. W.*

Cleaning Boilers.—There are many letters in your columns about boilers, but one thing I have not yet seen touched upon, and that is, how to clean them. My boiler is a saddle, and it has only a little hole about three-quarters of an inch in diameter in one of the wings, which is quite insufficient to get dirt out from it, and utterly useless to clean the other wing. Now is not the inefficiency of the boiler often due to the fault of the water, and the way it is put in? Mine used to be fed from a little wooden cistern, into which coal, ashes, and a little soot fell, and from there into the boiler, and now I fear there is a deposit of mud in it from the dirty water which supplies it, and which comes down from a mill-dam, holding a good deal of clay and mud dissolved in it. Is there any way of putting up a filter to clear the water, and yet allow a strong flow, for other places are supplied from the same source, and how can the boiler be really cleaned out? It is a pity that pressure holes are not made in them, which, as the pressure is slight, might easily be done. I have no doubt that many boilers are covered with a thick deposit from the water, causing a great loss in firing. *J. R. H.*

Perennial Candytuft.—If the variety alluded to at page 592 as *Iberis superba* be identical with the kind I have under the designation of *Iberis garretii-folia superba*, I can well bear testimony to its great value as a spring decorative plant. Taking it for all in all, I think it the best of the genus, for although *I. gibraltarica* produces the largest trusses of bloom, the flowers are in the open, and the plant does not freely produce; the plant is of somewhat irregular habit, and it certainly is not thoroughly hardy. *I. garretii-folia superba* has, next to *I. gibraltarica*, the finest trusses, and these are of even purer hue than are those of *I. corifolia*, and are borne on longer stems, so that the plant is pre-eminently useful to furnish cut flowers. It is robust, of a free spreading habit, and quite hardy. Taken in conjunction with the *Cheiranthus Marshallii*, so full just now of rich orange flowers, I think these are two of the most effective and valuable of hardy perennials for the present season. *A. D.*

Coccocypselum discolor.—Although this is not a showy stove plant it is nevertheless a useful and somewhat curious one—useful on account of its trailing habit as well as by reason of its easy culture and striking contrast to other plants of similar growth, and curious on account of the deep blue berries which ornament the drooping shoots, which, hanging over the edge of the staging in pots, with white plants of *Pantolium variegatum*, &c., have a very pleasing effect. The leaves, too, which are ovate and about $\frac{1}{2}$ inch long, are covered with a down of the same colour as the berries. The plant propagates freely from cuttings, and succeeds under the most ordinary stove treatment. *H. W. W.*

The Salt Stork of April 29.—The storm of Saturday week did sad mischief here. All the early deciduous trees suffered terribly, and many of them are, I fear, injured for the year, as the leading and principal shoots appear quite destroyed at their extremities. No others suffered so much as the Maples, of which I have a considerable collection. I send you specimens of the foliage of *Acer saccharinum*, *A. dasycarpum*, and *A. platanoides* to which you may taste the salt still remaining, though they have been washed with frequent rains ever since. The

salt completely cauterised the foliage. Some of the evergreens, such as the common Laurel, and still more the Portugal Laurel suffered very much; but none of the Conifers, though several of them had put forth a considerable length of young tender shoots. *Cedrus atlantica*, the early common Spruce, and more especially *Picea cephalonica*, were covered with soft youthful growth, but they were uninjured. I am about 40 miles from the sea—the nearest point; but the wind did not come from there. It was west by south, and the atmosphere must have crossed North Devon, Somersetshire, Wiltshire, and part of Hampshire before arriving here. Still, the brine of the Atlantic was in it, as my poor trees indicate, but too clearly. *James Salter, Basingstoke, Basingstoke.*

Bouvardias.—Those who have the convenience of a few or intermediate-houses should not fail to grow a few Bouvardias, as, unquestionably, they are among the most useful winter-flowering plants in existence, affording as they do a large amount of choice bloom, which is of great value for cutting and working up in bouquets. To have them of a serviceable size, cuttings should be struck at once, and to obtain these it is necessary to put one or two old plants in strong moist heat, which will soon induce them to break and form side shoots, and these when about 3 inches long are sufficiently advanced for removal. If the cuttings just below a joint with a sharp knife and the lower leaves carefully removed, they will root as readily as *Verbenas*, but to get them to do this they must be placed in a propagating-box where they can be kept close and have a brisk temperature, or stood on a shady shelf up near the light in a stove covered with a bell-glass, under which they get the conditions required. As soon as struck—which, if all goes well, will happen about a month—they should be potted off singly in small pots and returned to the propagating-box, or to a hot-bed frame, where they can have the benefit of a moderately close moist heat for a time to get a fresh start. When fairly on the move they should at once have more air to gradually prepare them for the change of standing out in the open. As the summers are variable, and sometimes wet and cold, it is advisable to prepare a bed for them in a frame, where in case of an adverse change the lights may be put on, and if this is done the young plants may be planted in the bed by the middle of June. In making up the frame, the foundation should be formed by a foot or so of half rotten leaves, and on these 6 inches of refuse peat or leaf-mould and sharp turfy loam spread, in either of which Bouvardias root readily and grow with great freedom. As they are of thin spare habit a foot apart is quite far enough to plant, and as soon as they get beyond the points of the shoots should be nipped out, which will cause them to break and become moderately bushy below. All further attention the plants will require during summer is to be kept syringed or damped overhead on the afternoons of hot days and duly watered whenever they become dry at the roots. If greenfly assail them the easiest remedy is to close the lights and fumigate, or the plants may be syringed with weak tobacco-liquor, which will cleanse them at once. By the end of September the growth will be thoroughly hardened, and it will be time to lift and re-pot the plants, which should be done in light peaty soil, when it will be necessary to keep them close and warm till they get over the check. If wanted in flower early a few of the most forward may be placed in heat at once, and if kept there after the heads are cut they soon break again and yield a succession of bloom. Bouvardias will flower fairly well in a moderately warm greenhouse, but not nearly so well as they will where they can be subjected to more heat, as there they bloom continuously if assisted by the application of weak liquid-mannure. As to sorts the best to grow are *Vreelandii*, *Hogarthii*, *Maiden's Blush*, and *Oriflamme*, unless the doubles now being advertised should turn out more valuable, but of these I have had no experience as yet. Double flowers, however, are generally more lasting, although in this case it is doubtful if the doubleness will add to their beauty as compared with the singles, which are the perfection of lightness and finish. *J. Sheppard.*

Where to Plant Surplus Spring-flowering Plants.—As the time when spring-flowering plants—a few of which are still at their best—will have to make way for the summer occupants of the flower garden is now at hand, may I be allowed to suggest, for the benefit of those of your readers who may have been in the habit of consigning their surplus plants to the rubbish-heap, the planting of them in irregular and alternate patches on the banks on either side the avenues, shrubbery walks, and here and there in suitable situations amongst the trees in frequented places. Thus planted places which heretofore were cheerless in early spring are now, by reason of the masses of blue Forget-me-Nots, Violas, Primroses, Daffodils, white Arabis, Wallflowers, Violets, &c., which meet the eye at every turning in the drives and walks, rendered pleasing and interesting spots of resort, and the

air, which is pervaded with the fragrance of those ever popular flowers—Wallflowers and Violets—more pleasant to breathe. There are not a few unattractive spots in many places adjoining the carriage drives through the park, woods, and other frequented places which might, in the way above suggested, be beautified at a trifling labour expense. *Tortus.*

The Mimulus.—The superb forms of *Mimulus maculatus* which Mr. Clapham has created by long selection and careful hybridisation, in addition to their almost gorgeous beauty, are truly very hardy. I put out a large number of strong plants as early as the first week in April, and they are blooming very profusely. From one seedling plant I gathered flowers exactly 3 inches across, and perfectly round. I think those were the finest I have yet seen. On soil that is fairly good and light, yet cool, the Mimulus will grow almost luxuriantly, and produce a fine effect. The object of the grower should be to get up a good growth of side shoots, and to effect this it is well to stop the main or centre growth early. Plants will do remarkably well in the autumn, blooming late and luxuriating in the cool moist weather which then prevails. *A. D.*

Insects.—When Shakespeare penned those true and true words, "The worst of creatures fastest propagated," he must, one would think, have known something of garden troubles, and yet of the insects with which they have to contend, for truly the increase of some of these is marvellous, and where they spring from, or how many of them originate, is a mystery. Take red-spiders, for instance, the most minute of the lot, and the puzzle is how such pests get into a quite new house freshly planted with Vines or Peaches, and yet, if the conditions are favourable, hosts of them soon come into existence and spread with the greatest rapidity. Bad as red spiders are, however, they are not to be feared so generally, which breed so fast as to almost outrun all calculation, and if one or two only appear on a plant, their progeny, and those issuing from them, are soon all over the leaves, sucking out the juices and curling them up. What they have a special liking for just now are Roses and Peaches, which both show unmistakable signs that the enemy is at work, for, look where one will, crippled shoots are to be seen, and if these are not liberated and set going at once, they will take a long time in getting over the check. Tobacco-dust, though highly dangerous to leave on for any lengthened period, is an excellent remedy against aphids, as with a distributor, which may be carried in the pocket while disbanding is going on, a puff may be given to any shoot affected, and the progress and breeding of the insects at once stopped.

The best time, however, to apply the tobacco-liquor is early in the morning, when the trees or bushes are moist with dew, as then it adheres best, and as it at once acts on the fly, and causes them to leave their hold, they may easily be washed off by means of water from a garden engine or syringe. By looking over Peaches and Nectarines occasionally and treating them in the way referred to, they may be kept clean without having recourse to Gishurst or other insecticides of a similar nature, none of which can be used with the greatest success, a small tender shoot without much risk being injured. The dust may be made work of freely in such a case, and to make short work of the greenfly on Roses and cleanse the plants of their presence, there is nothing I am acquainted with equal to nicotine soap, which has the active properties of Tobacco in it, and by diluting it to the proper strength it may be syringed on, or the long shoots bent down and dipped in without causing much waste. Quassia chips boiled with some soft-soap in the water forms a good and cheap insecticide, and if a little tobacco-juice or nicotine is added it will quickly vanish under its influence. The only way of dealing effectually with the Rose-maggot, so snugly ensconced in the leaves it so dexterously curls, is to give each a loving squeeze between the finger and thumb, which may be done without bruising or harming the young tender foliage, as the grub is soft and collapses under the gentlest of pressure. The Gooseberry caterpillar, so prevalent in some gardens, may be got rid of by the same means, which should be sown thickly on the ground under the bushes, as there the larvae be hatched and issue forth as soon as the weather gets warm. Currants, so subject to greenfly, which affect the tips of the young branches, are best managed by nipping the points out, as the aphid cannot exist on the old hardened leaves, the tissues of which are too tough for them to get the sap through. The worst of all the aphid family are the black, which usually affect Cherries, and the only way of destroying them without harming the shoots is to use a strong solution of nicotine soap and immerse them all in it. The liquid at once penetrates their oily coating, and by its quick action seems to dissolve them. The aphid peculiar to Plums are almost as difficult to kill, and the best way of battling with these and the black on desert Cherries is to remove the young shoots early by timely stopping, as by doing this they may in many cases be kept away altogether. As to red-spider, the best

remedy where they affect trees on open walls is cold water, drenchings of which from a garden engine they cannot endure. Dryness at the roots is a frequent cause of these parasites affecting Peaches, to prevent which it is a good plan to mulch all trees with half-rotten manure, and this should be done early, so as to keep the moisture in and maintain the soil in an equable condition of warmth. By-and-by, when the fruit is swelling fast, an occasional soaking of sewage will do much towards keeping the trees in vigorous health, and will also assist them greatly in carrying their load. *J. Shappard.*

Reports of Societies.

Royal Horticultural: May 9.—James McIntosh, Esq., in the chair. The Rev. G. Henslow took Maples as the subject of his lecture, as Messrs. Veitch exhibited a fine series of new forms from Japan, remarkable for their coloured and variously dissected foliage. He first called attention to the fact that Maples abounded in the Miocene epoch, nineteen species having been found fossil at Teningen near Lake Constance. They were even attacked by a fungoid disease much resembling the Rhytisma acerinum, which forms black spots on the Sycamore. Maples were well known to the ancients for the value of their wood. Theophrastus, Virgil, and Ovid often alluded to the markings on the wood, for which it was prized, as it is now. Maples are found in Europe, North America, North India, and Japan. Of the European, the common Maple (*Acer campestre*, L.) is a well-known British shrub or small tree, the wood of which is valuable for cabinet work, and makes one of the best charcoals. *A. Pseudo-Platanus*, L., the Sycamore, has also valuable timber, while the knotted roots are used for inlaying, &c. The sap has been made into sugar and wine in the Western Highlands of Scotland. Of American species, *A. saccharinum*, L., the Rock-sugar or Bird's-eye Maple, is one of the most important. It was introduced here in 1735. The timber is valuable, and used instead of Oak when the latter is scarce. The fibres sometimes show peculiar arrangements, being undulated like that of the "curled Maple" (*A. rubrum* L., the red flowering Maple), or in spots, which gives the name of Bird's-eye. It forms excellent fuel and the ashes are rich in potash. Sugar is extracted from the sap by boiling, the flow of sap being peculiarly sensitive to climatic conditions (see a paper by Mr. Maw in the *Gardeners' Chronicle*, 1878, p. 137). Of the Japanese Maples lately introduced by Mr. Veitch, *Acer palmatum*, or polymorphum, is the most important, as being remarkable for the great variety in the forms and colour of the leaves. It was originally introduced in 1822, but for the beautiful and delicately cut-leaved new forms we are indebted to Mr. J. G. Veitch and Mr. C. Maries. Their names, *Ampelopsifolium*, *atropurpureum*, *dissectum*, &c., will describe their different peculiarities. Another species—*A. distylum*—as well as *A. carpinifolium*, both from Japan, are curious for the leaves being without lobes, the usual number varying from three to seven. As the first leaves developed on seedling plants (e.g., Sycamore) are without lobes, it represents a primitive condition, while the five or seven lobes obtained by later developed leaves, and characteristic of many species, would seem to be later developed forms—the three-lobed *Acer trilobatum* having been particularly characteristic of the Miocene epoch. Several other beautiful and interesting forms were exhibited by Messrs. Veitch, which were introduced by them, some not yet having distinctive names. He also exhibited some curious specimens of Japanese grafting, several varieties having been grafted on the same stem.

SCIENTIFIC COMMITTEE.—Sir J. D. Hooker in the chair.

Larval Disease.—A letter was read from Mr. Clutton with reference to the statements made at a previous meeting by Mr. McLachlan, and stating that there was no doubt but that the insects really were effecting great injury by stripping the shoots of the leaves.

Rhododendrons.—Mr. Mangles showed cut blooms of several species and varieties of *Rhododendron*, and commented upon their characteristics. Among the specimens exhibited by Mr. Mangles were—1. One of the hybrids originally raised by Dean Herbert between *Azalea viscosa*, as the pollen parent, and *R. maximum*, and called *R. bigener*. 2. *R. nilagiricum*, true—a scarlet flowered variety, from the Nilgiri hills, and which occurs in Ceylon and other parts of India under various names. 3. *R. nilagiricum* of gardens, a large, pale rose-coloured variety, misnamed, as it is not a native of the Nilgiris but of Nepal, being, in fact, *R. Campbellii*. 4. *R. Fortunei*, a species discovered by

Fortune on the mountains of the province of Chekiang, at a height of about 3000 feet (see *Gardeners' Chronicle*, 1859, p. 368; *Botanical Magazine*, t. 5596). "The discovery," says Mr. Fortune, "was most unexpected, for . . . no *Rhododendron* had previously been known to exist in this part of China." The foliage is bold, the leaves oblong, heart-shaped, cuspidate, white on the under-surface; the flowers are borne in a somewhat pyramidal truss, the individual flowers being large, widely campanulate, pale rosy-lilac, nearly regular, and with stamens of nearly equal length. The parts of the flower are in seven. The flower recalls that of *R. Aucklandi*, but is abundantly distinct. 5. *R. calophyllum*, from Bootan, with bold oblong lanceolate leaves, glaucous on the under-surface, and large funnel-shaped white flowers. 6. *R. Edgeworthii*, with its rugose leaves covered with brown pubescence beneath. 7. *R. Thomsoni*, with its deep red flowers, in this instance quite free from spots. 8. *R. californicum*, a species remarkable from

affected in consequence of their varying modes of growth.

Germination of Seeds.—An interesting communication on this subject from Mr. Anderson-Henry was read, of which we hope to give the substance on another occasion.

Plants, &c., Exhibited.—Rev. H. Harpur-Crewe showed flowers of *Muscari armenicum*, the white variety of the Persian Lilac, which is very rarely met with; also of *Paeonia Witmanniana*, a native of the Caucasus, with flowers of a pale sulphur-yellow, and leaves puberulous on the under surface. Mr. G. F. Wilson showed a trowel of a particular shape, useful for dividing plants with as little injury to the roots as possible. As we shall probably give an illustration of this we defer further comment. From Mr. Doscaven came flowers of *Papaver umbrosum*, and from Mr. George, a flowering specimen of a hybrid between an Ivy-leaved *Felagonium* (*F. peltatum*) and *P. zonale*.

FIG. 101.—MASDEVALLIA ROSEA. (SEE PP. 628, 646)

its habitat, in the extreme Western States of the Union, and quite different from anything on the opposite side of the continent. The species is hardy here, and has pyramidal trusses of medium-sized rosy-lilac flowers, not unlike those of *R. ponticum* in form. 9. *R. Blandfordi*eforum, a very remarkable Malayan species, with tubular orange flowers, tipped with yellow. (See *Gard. Chron.* 1856, p. 548.) 10. *R. Koylei*, a species with reddish tubular flowers, somewhat like those of *R. Thomsoni*, but different.

Reversed Mushroom.—Mr. W. G. Smith showed a Mushroom (from Mr. Clarke, The Gardens, Shadwell Court, Theford) with a second in a reversed position on the top of the cap of the first, as has been figured in our columns on other occasions.

Fungus in Dilute Sulphuric Acid.—Mr. Smith alluded to the presence in large quantities of a fungous mould in dilute sulphuric acid, tinted with cochineal. The fungus when cultivated in syrup developed first into the "vinegar plant," and ultimately into *Penicillium crustaceum*.

Effect of the Late trials on Leaves.—Dr. Masters exhibited specimens of leaves of various trees, to show the different manner in which they were

FLORAL COMMITTEE.—The Rev. H. Harpur-Crewe in the chair. The principal new plants shown on this occasion were *Frax angulata*, a New Zealand trailing plant, with minute rhomb-shaped irregularly toothed leaves, and relatively large white Lobelia-like flowers; it is a charming plant for carpeting on the rockwork; *Azalea pontica atalerensis*, a variety with deep fiery orange-coloured blossoms; *Eurybia Gunni*, a Tasmanian shrub, with small, hoary, oblong, coarsely toothed leaves, and white starry flower-heads, each about an inch across, and freely produced at the ends of the branches; *Asiatic Thunberg*, a Japanese under-shrub with unequally pinnate or bi-pinnate leaves, the segments broad, yellowish-green, and sharply toothed; the small white flowers are very numerous, and borne in erect much branched pyramidal panicles, the flower-stalks being of a reddish colour and slightly downy. *Azalea rubiflora flore-pleno*, a species with soft pilose leaves, like those of *Azalea mollis*, and large double pinkish-lilac flowers, the petals being slightly spotted. *Cypripedium microchilum* had white flowers, the sepals marked with a central purple stripe on the inner surface; the lip is

small, white, and compressed from side to side; and *Dendrobium Curtisii*, a species with slender, leafless erect stems and small magenta-coloured flowers; on the barren shoots the leaves are linear lanceolate. These came from Messrs. Veitch & Sons. From Sir Trevor Lawrence, Bart., M.P. (Mr. Spyers, gr.), came *Pescatorea Lehmanni*, figured and described at p. 44 of our present volume; *Oncidium teretifolium*, a species with erect cylindrical leaves as thick as the thumb, and erect many-flowered panicles, the individual flowers being small and of a bright yellow colour; and *Masdevallia rosea*, flowering for the first time in Europe. The illustration, fig. 101, and the note published at p. 628, preclude the necessity of entering into further detail here. Messrs. Kelway & Son, Langport, showed *Scelopendrium vulgare* var. *densum*, a curious little variety, the short leaves of which are arranged and curled so as to resemble Parsley, and are divided in small dome-like tufts. Of this we shall give a full description on another occasion. From the Chairman's garden came *Mascria armenicum*, the largest and best of the *Mascria*. Messrs. Hurst & Son, Houndsditch, exhibited a variety of *Myosotis alpestris*, with golden-yellow foliage, a combination of colours not at all appropriate or suitable. Mr. B. S. Williams had *Amaryllis* *Edith*, a variety with nicely formed flowers very bright scarlet, feathered with white; the new Palm, *Kentia costata*, and a good plant of the grand *Hydrangea paniculata grandiflora*. Messrs. W. Paul & Son, Waltham Cross, had a small group of new *Noses*, which included a very pleasing new *H. P.*, named *Ulrich Irumer*, which will probably gain a higher award than the Committee gave it to-day. It is in the way of *Etienne Levet*, of beautiful form, deliciously scented, and one of the brightest in colour when seen at its best. Another new *H. P.*, *Queen of Queens*, also attracted some attention, being of the style of *Francois Michelin*, large and full, but peach-pink in colour and thin in the petal, and much wanting in fragrance. Cut flowers of some very pretty seedling *Carnations* came from Mr. Duffield, gr. to H. K. Mayor, Esq., Winchmore Hill; and a crimson-magenta of excellent form named *W. Howard* came from Mr. Howard, of Southgate, who also showed another good thing in the variety *Principina*, of which we shall also publish a full account in a subsequent issue. A nice box of seedling *Pansies* came from Mr. J. W. Perkins, Woodfield, Deckenham; and under the name of Mrs. Chas. Butler Mr. G. Aslett, gr. Warren Wood, Hatfield, exhibited beautiful blooms of *Rhododendron Fortunei*. Mr. Bennett, of Shepperton, contributed another of his hybrid *Tea Roses*, *Duchess of Albany*, a peach-coloured flower with a soft rose-coloured centre. Messrs. Canell & Son had another of their grand strains of zonal *Pelargoniums*, and some flowers of a good strain of *Mimulus*, including a duplex form. The awards made were as follows:—

First-class Certificates.

To Sir Trevor Lawrence, Bart., M.P., for *Pescatorea Lehmanni*.

To Sir Trevor Lawrence, Bart., M.P., for *Oncidium teretifolium*.

To Messrs. James Veitch & Sons, for *Azalea rubrifolia* (flore-pleno).

To Mr. W. Howard, for *Tree Carnation "W. Howard"*.

To Mr. W. Howard, for *Davallia Griffithiana*.

To Messrs. Kelway & Son, for *Scelopendrium vulgare densum*.

To Mr. Aslett, for *Rhododendron Fortunei*.

To the Rev. H. Harpur-Crew, for *Mascria armenicum*.

Second-class Certificate.

To Messrs. William Paul & Son, for *H. P. Rose Ulrich Brunner*.

FRUIT COMMITTEE.—John Lee, Esq., in the chair.

Mr. S. Ledham, Tarvin Road, Chester, again sent examples of his late *Broccoli*, all *Broccoli*, the most handsome and best in quality of any that have come under our notice. With heads of medium size, compact, and perfectly white, it is one of the most attractive in form, and as we have proved, of excellent table quality. A First-class Certificate was awarded. Messrs. James Veitch & Sons showed their Model *Broccoli*, a hardy, dwarf, self-protecting variety; and Mr. Draper, Gatham Hall Gardens, Sunderland, sent his selected variety, both of which suffered by the comparison with Ledham's. Mr. C. J. Salter, gr. to J. Southgate, Esq., Streatham, sent half-a-dozen fruits of the *Selborne Royal Cucumber*, a white-spined variety, ranging about 18 inches in length, but having an objectionably long neck. Messrs. Hurst & Son showed a handsomely variegated *Broccoli*; and Mr. Divers, gr. Wierton House, Maidstone, sent examples of *French Crab*, *Hansell's Souring*, *Court-pennet*, *Plum*, *Crab*, *Hansell's Apples*, and Mr. J. May, gr. to Capt. Le Blanc, Northaw House, Barnet, sent an early white-fleshed *Melon*. Mr. Miles sent from Wycombe Abbey Gardens two samples of winter *Spinach*, the one run to flower, as an usually sees it at this time, and the other—supposed to be a later variety—showing no signs of bolting, but having a good crop of large succulent leaves.

PROMENADE SHOW.—We were required to record a falling-off in the last meeting or two, and especially of the one under notice. It is not a healthy sign just at present, and we hope, is only the result of a little nursing for the summer show. The exhibition was held to-day in the western arcade, and included only a fine collection of pot *Roses* and cut blooms from Messrs. Wm. Paul & Sons, Waltham Cross, which gained a Silver-gilt *Flora Medal*, and which are fully alluded to at p. 634. Mr. B. S. Williams sent a small group of plants, conspicuous amongst which was a profusely flowered example of the beautiful *Psychotria jamaicensis*. A large collection of Japanese *Acer*s, which formed the subject of Mr. Henslow's afternoon lecture, came from Messrs. Veitch & Son, and were awarded a Silver *Flora Medal*. A beautiful collection of cut blooms of *Pyrethrum* grown under glass secured a Silver *Bankers Medal* from Messrs. Kelway & Son, Langport; and a similar award went to Mr. Runsey, Waltham Cross, for a choice lot of cut blooms of *Roses*. A large group of *Herbaceous Calceolarias* from Mr. C. J. Salter gained a Silver *Flora Medal*. From Chiswick Mr. Barron sent up a well-varied assortment of admirably grown plants in flower, including many of the always interesting race of *Cape Pelargoniums*.

Scottish Horticultural Association.—The ordinary monthly meeting of this Association was held in the Hall, 5, St. Andrew Square, Edinburgh, on Tuesday, May 2; Mr. Hugh Fraser, the President, in the chair. Mr. Alex. Shearer, landscape gardener, 4, Marchmont Street, Edinburgh, delivered an address on "Gardening Chemistry." Mr. John Morrison, Coney Park, Stirling, received a First-class Certificate for a new seedling *Rhubarb*, named *Stirling Castle*. It was of a beautiful crimson colour. Mr. Geo. McClure, Trinity Grove Gardens, received a First-class Certificate for a seedling *Auricula*, named *Duchess of Albany*. Mr. Geo. I. Brown, Milburn Cottage, exhibited a *Polyanthus*. Mr. Jas. Pegg, Wardle Lodge, exhibited a seedling *Amaryllis*, also a seedling *Cheranthus* from C. Marshall. Mr. Jas. Giddings exhibited flowers of which *Ilac* taken from the open air. Mr. M. Chapman, Easter Duddingstone Lodge, exhibited *Ribes speciosum* in flower, and *Podophyllum Emodi*, also a gold-leafed *Polyanthus* with double flowers. Mr. J. Dowie, Hinchinbrock, exhibited a sample of the *Apricot crop* from a south-west aspect, grown in the open, also trusses of the yellow *Bankans Rose* from south-west aspect in open. Mr. Andrew Paul, Gilmore Place, exhibited two fine *Orchid* plants in flower, viz., *Odontoglossum Pescatorei* and *Oncidium phycitochilum*; they were much admired. Messrs. Field & Co. exhibited flowers of *Golden Turk*, *Ranunculus*, and *Anemone Queen of Scariets*. Messrs. James Dickson & Sons exhibited six *Auriculas*, viz., *Vulcan* (Sims), *Sims Giddings* (Reid), *Loyalist* (Holden), *White Royal* (Traill), *Richard Headly* (Lightbody), and *Black Prince* (Smith).

The Weather.

STATE OF THE WEATHER AT BLACKHEATH, LONDON, FOR THE WEEK ENDING WEDNESDAY, MAY 10, 1882.

MONTH AND DAY.	BAROMETER.	TEMPERATURE OF THE AIR.					HYGROMETRY.— Height of Dew Point.	WIND.	KNOWALL.

- May 4—A dull, damp day; great gloom from 12.30 to 3.10 p.m.; rain frequent till 3 p.m. Fine night.
- 5—A fine morning; overcast. A dull, gloomy afternoon. Rain at night.
- 6—Rain in early morning. A fine, bright afternoon, sun shining brightly, warm. Fine night.
- 7—A fine day, sun shining occasionally; thin clouds. Lightning seen in the North and West at night.
- 8—A very bright day, with sky overcast at times. Fine, cloudy night.
- 9—A very bright day, sun shining brightly. Dark sky. Fine night.
- 10—A dull, gloomy morning. A fine bright afternoon; sun shining. Sky overcast at times. Fine night, cloudy.

LONDON: Atmospheric Pressure.—During the week ending May 6 the reading of the barometer at the level of the sea increased from 29.46 inches at the beginning of the week to 29.81 inches by 9 A.M. on April 30, decreased to 29.73 inches by 9 A.M. on May 1, increased to 30 inches by 3 P.M. on the 2d, decreased to 29.71 inches by 3 P.M. on the 3d, increased to 29.73 inches by midnight on the 3d, decreased to 29.67 inches by 9 A.M. on the 4th, and was 29.97 inches at the end of the week.

The mean reading for the week at the level of the sea was 29.82 inches, being 0.38 inch higher than last week, and 0.12 inch below the average of the week.

Temperature.—The highest temperature in the shade in the week was 70°, on May 3. On April 30 the highest temperature was 50°. The mean of the seven high day temperatures was 61.7°.

The lowest temperature in the shade of the week was 37° on April 30; on May 6 the lowest temperature was 49°. The mean of the seven lowest temperatures was 44.5°.

The greatest range of temperature in one day was 23°.5, on May 3; the smallest was 12°, on the 4th. The mean of the seven daily ranges was 17.2°.

The mean temperatures were, on April 30, 45°.5; on May 1, 48°.4; on the 2d, 51°.2; on the 3d, 50°.7; on the 4th, 51°.2; on the 5th, 53°.5; and on the 6th, 54°.7; of these those of April 30 and May 1 were below their averages by 3°.9 and 1°.4 respectively, all the rest were above their averages by 1°.1, 6°.3, 6°.4, 2°.3, and 3°.1 respectively.

The mean temperature of the air for the week was 51°.6, being 5°.7 higher than last week, and 1°.1 above the average of the week.

The highest reading of a thermometer with black-ening in vacuum placed in the full rays of the sun, was 133° on May 3; the highest on the 4th was 67°.5. The mean of the seven days readings was 114.4°.

The lowest reading of a minimum thermometer with its bulb placed on grass and fully exposed to the sky was 33°, on April 30. The mean of the seven readings was 39.7°.

Rain.—Rain fell on six days, to the amount of 1 inch.

ENGLAND: Temperature.—During the week ending May 6 the highest temperatures were 70°, at Blackheath, 69°.4 at Cambridge, and 67° at Sunderland. The highest temperature at Liverpool was 58°.4, at Bolton 58°.5, and at Hull 60°. The general mean was 63.6°.

The lowest temperatures in the week were 30°.5 at Cambridge, 33° at Sunderland, and 33°.1 at Wolverhampton. The lowest temperature at Brighton was 38°.6, at Bristol 38°.2, and at Plymouth 37°.8. The general mean was 35.7°.

The greatest ranges of temperature in the week were 38°.9 at Cambridge, 34° at Sunderland, and 33° at Blackheath. The least ranges were 20°.9 at Liverpool, 23° at Hull, and 24°.5 at Plymouth. The general mean was 27.9°.

The mean of the seven high day temperatures was highest at Cambridge, 63°.5, at Sunderland 61°.8, and at Blackheath 61°.7; and was lowest at Liverpool, 54°.6, at Bolton 55°.2, and at Bradford 55°.5. The general mean was 58.7°.

The mean of the seven lowest night temperatures was highest at Brighton, 46°, at Plymouth 44°.8, and at Blackheath 44°.5; and was lowest at Bolton, 38°.3, at Wolverhampton 39°, and at Sunderland 39°.3. The general mean was 41.8°.

The mean daily range was greatest at Cambridge, 22°.3, at Sunderland 22°, and at Truro and Nottingham 19°.7; and was least at Liverpool, 11°.6, at Plymouth 12°.8, and at Leeds 13°.2. The general mean was 16.9°.

The mean temperature for the week was highest at Brighton 51.8, at Blackheath 51.6, and at Cambridge 50.7; and was lowest at Bolton 45.1, at Wolverhampton 46°, and at Bradford 46°.9. The general mean was 48.5°.

Rain.—The largest falls were 1.63 inch at Nottingham, 1.55 inch at Leeds, and 1.13 inch at Bolton. The least falls were 0.41 inch at Liverpool, 0.49 inch at Plymouth, and 0.50 inch at Hull. The general mean fall was 0.93 inch. Rain fell on every day in the week at Bristol, and on five or six days at other stations.

SCOTLAND: Temperature.—During the week ending May 6 the highest temperature was 64°, at Dundee and at Paisley; at Greenock the highest temperature was 54°. The general mean was 57.8°. The lowest temperature in the week was 38°, at Paisley; at Leith the lowest temperature was 38°. The general mean was 33.6°.

The mean temperature for the week was highest at Paisley, 45°.5; and lowest at Aberdeen, 45.7°. The general mean was 46.9°.

Rain.—The largest fall was 1.14 inch at Greenock; the smallest was 0.12 inch, at Paisley. The general average fall was 0.59 inch.

JAMES GLAISHER, F.R.S.

Obituary.

On p. 604 reference was made to the deaths of two famous Northern florists—Mr. THOMAS WOODHEAD, of Halifax, and Mr. THOMAS MELLOR, of Ashton-under-Lyne. Mr. Woodhead died at his residence, Shildon Head, Halifax, on Sunday, April 30, at the age of fifty years, the cause of death being Bright's disease. He had been ailing for something like a year previously. For twenty years Mr. Woodhead had been a grower of Auriculas, and possessed one of the best, if not the best, collection in England. He was an amateur cultivator, as he filled the position of manager of the Shildon Head Brewery Company at Halifax for a considerable time. He was a lover of flowers from childhood, but his speciality was the Auricula, and in the blooming season he spent a great portion of his leisure among his flowers. Of late years he raised several seedlings, a few of which were seen at the Auricula Show at South Kensington a short time since, and others will be heard of in due course. In private life Mr. Woodhead was much esteemed. He was one of Nature's noblemen, and very straightforward in all his dealings. Hitherto Mr. George Rudd, of Bradford, has distributed the overflow of Mr. Woodhead's collection, but nothing is known at present as to what will be done with the plants. The collection is said to be rich in such fine varieties as George Lightbody, Smiling Beauty, Lanchashire Hero, Colonel Taylor, Both's Traclove, &c., as well as promising seedlings.

THOMAS MELLOR, who was for many years a constant exhibitor at the Auricula and Tulip shows in Lanchashire, died at his residence, at Ashton-under-Lyne, on May 1, at the age of sixty, or thereabout. He was a shoemaker by trade, but of late years had devoted himself almost entirely to floricultural pursuits. He cultivated Pinks, Ranunculuses, Tulips, Carnations, Pinks, Auriculas, Polyanthus, &c. He was one of the last of the Pink growers in his district. As much as thirty years ago he was an exhibitor of Pinks at Middleton. As a raiser he appears to have done but little save with Auriculas, and with these only recently. It is said he had a fine lot of promising seedlings. His garden was at Ashton Moss, some distance from his residence, and here he spent a great deal of his time. He, as well as the late Thomas Woodhead, was a member of the committee of the Northern National Auricula Society, and was a constant subscriber, and an attendant at the meetings, and always had good counsel to give. He was very upright in all his transactions as a florist, and is much mourned by those who had floricultural relations with him, as well as by those who were more intimately acquainted with him. It is said his fine collection of Auriculas has passed into the hands of Mr. William Brickbank, of Didsbury.

Enquiries.

He that questioneth much shall learn much.—DAVID.

BLACK PAINT FOR WALLS.—I am having some stone-and-line garden walls pointed, cemented, and wired. I propose to have them washed over with cement and water to cover cracks, &c., and then painted black. What would be the best stuff to use to blacken them with which will not hurt the trees? I have plenty of coal-tar, but understand that will destroy the trees. Oil paint will be far too expensive. Y. K. H. [Try Hill's Black Varnish, if not too costly. Ed.]

Answers to Correspondents.

COLLUS, G. H. A poor thing, of no commercial value. FIGS: 7. O. The affection looks very much like the work of a fungus, but we have found nothing in the shape of spores. The cells are gorged with yellow matter, and the hairs are in the same condition. It may arise from a sudden chill, or it is possible that thrips was present when the fruit was very young? It is only the superficial cells which are affected at present. We should be interested to know what the condition of the fruit is later in the season. M. J. D.

INSETS, F. H. K. Your Apple trees are attacked by numbers of the Weevil, Curculio (Nematus) oblongus, which destroy the buds of young Apple trees just as they burst forth, by eating them utterly away, and dropping to the ground at the slightest approach of danger, and reascending the trees in a few minutes after the danger is past. By laying large sheets under the branches, and violently shaking the latter, the beetles are easily dislodged, and may be swept off the sheets without delay, and burned. If left undisturbed, the females will deposit their eggs in the bloom-buds or young twigs, which should be picked off and also burnt. L. O. W.—D. K. The caterpillar is that of one

of the Geometridious Moths ("loopers" as they are popularly termed), probably of the "Orange-tooth" (Angrona prunaria). The mimetic resemblance to twigs occurs in many species, and was familiar to the earliest authors on the metamorphoses of insects.—Schubert, Co. Dava. The gummy-looking objects on the fruit-twigs are the females of a large species of cocoon or "scale insect." They should be exterminated as soon as possible, or they may occasion much damage if present in numbers.

NAMES OF PLANTS: H. T. B. No. 2, Spiraea Thunbergii; 4, Cytisus sessiliflorus. The other two, without numbers, are Caragana arboreas and Amelanchier canadensis, var. alabamica.—H. G. C. & S. Asparagus officinalis.—G. W. G. 1, Dendrolium perfoliatum; 2, D. fruticulatum; 3, Lycaete Harrisoniae.—H. J. R. Pteris longifolia, certainly.—A. H. The largest flower is Lycaete Harrisoniae. The others were not under numbers. Send again with more particulars.—T. B. M. 1, Aphyllanthes monensis; 2, W. F. C. & S. Arthropodium cirratum.—T. B. 1, Othonopsis cheirifolia.—C. W. D. 1, Veronica austriaca var., but we do not find the exact form you send in the Kew Herbarium, though we do not doubt that it belongs to that polymorphic species; 2, Taraxacum cordifolia, certainly; 3, Saxifraga tenella; 4, Erigeron philadelphicus; 5, E. bellidifolius.—H. M. 1, A semi-double flowered variety of Staphylea pinnata.—H. S. 1, Saxifraga granulata, fl.-pl.; 2, Muscar comata, C. Kimberley. The Bird Cherry (Prunus Padus).

PAINT: Y. K. H. Lead-paint. PANSLY: A Constant Reader. A very good strain; the fancy flowers especially being highly commendable.

PANSIES AND POLYANTHUSES: W. Candell. The Pansies are of good size and fair form, and the colours in the fancy flowers bright and well varied. The double sulphur-coloured Primrose is very fine, and very pleasing also; the yellow Polyanthus Golden Queen and the hose-hone form called Cloth of Gold, Jupiter, a very dark velvety maroon with bold clear centre, is very effective.

POLYANTHUS: J. L. Your gold-headed Polyanthus is a clear, bright, and showy border flower, but by no means a novelty. As a florist's flower its great defect is its blue-eye.

SHAMROCK: J. B. Dr. Prior says Medicago lupulina. In London T. repens is the plant generally used.

VINES: R. P. The excrescences are due to some derangement of the growth that is not much understood. They will do no harm.

WALLFLOWERS AND PANSIES: F. Komer. The flowers arrived in very fair condition. The brown, dark brown, and yellow extra double tree Wallflowers are splendid, more like double Saxets than Wallflowers, so perfectly double and handsome are the blooms. Of the Pansies we cannot write in such high terms; they are not first-class, judged by our standard. Dr. Faust or King of the Blacks is the only one we should covet.

* Correspondents are specially requested to address, post-paid, all communications intended for publication to the "Editor," and not to any member of the staff personally. The Editor would be obliged by such communications being written on one side only of the paper and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the Publisher, and not to the Editor.

FOREIGN SUBSCRIBERS sending Post-Office Orders are requested to make them payable to William Richards, at the post-office, King Street, Covent Garden, London, and to send some note to inform the Publisher at the office of this journal.

Markets.

COVENT GARDEN, May 11.

Trade somewhat quieter this week, and prices depressed. James Webber, Wholesale Apple Market.

Table with 2 columns: Fruit—Average Wholesale Prices and Lemons, per 100. Lists various fruits like Figs, Gooseberry, Raspberries, etc. with prices in s. d. and p.

Table with 2 columns: Vegetables—Average Retail Prices and Potatoes, doz. Lists various vegetables like Artichokes, Asparagus, Beans, etc. with prices in s. d. and p.

CUT FLOWERS—Average Wholesale Prices.

Table with 2 columns: Cut Flowers—Average Wholesale Prices and Aralia, white, doz. Lists various cut flowers like Abutilon, Anemone, Arum lilies, etc. with prices in s. d. and p.

PLANTS IN POTS—Average Wholesale Prices.

Table with 2 columns: Plants in Pots—Average Wholesale Prices and Aralia Schottii, per doz. Lists various potted plants like Arbutus, Arum lilies, Azalea, etc. with prices in s. d. and p.

SEEDS.

LONDON: May 10.—A very quiet trade characterises the trade for farm seeds, and the season can now, in fact, be regarded as over. According to the Board of Trade returns the imports of Clover and grass seeds into the United Kingdom for the past month were 2,720,000 cwt., value £55,134; and 1,370,000 cwt., value £284 for Clover and other seeds continue to drop in, but for the moment there is no speculative enquiry for any description. Mustard and Rape seed are in improved request. Linsed tends slightly downwards. John Sainsbury & Sons, Seed Merchants, 37, Abchurch Lane, London, E.C.

POTATOS.

The Borough and Spitalfields Markets reports state that moderate supplies are to hand, which meet with a quiet trade. Quotations—Scottish Champsions, 50s. to 60s.; ditto Regents, 70s. to 80s.; Magnum Bonum, 55s. to 60s.; Victoria, 110s.; Lincoln Champions, 60s. to 70s.; York ditto, 60s. to 70s.; ditto Victoria, 120s.; flukes, 130s. per ton; German Reds, 4s. to 4s. 6d. per bag.—The imports into London last week comprised 15,847 bags from Birmingham, 2713 bags 837 half-boxes from Lincoln, 1754 packages from Malta, and 1195 bags from Snettlin.

COALS.

The following are the prices current at market during the week:—Easton Wym, 15s.; Walls End—Hawthorns, 14s. 3d.; Lambton, 15s.; Original Hartlepool, 15s. 6d.; Wear, 14s.; South Hetton, 15s. 6d.; Carleton, 15s. 6d.; South Kellow, 15s.; Thornley, 15s.; Hatfield, 15s. 6d.; Hetton Lyons, 15s.; Tunstall, 14s.; Chilton Tees, 14s. 6d.; Tees, 15s. 6d.

DAY, SON & HEWITT,

Inventors and Sole Proprietors of the "Original"

STOCK-BREEDERS' MEDICINE CHESTS,

FOR ALL DISORDERS IN HORSES, CATTLE, CALVES, SHEEP & LAMBS;
AND INVENTORS OF THE

FIRST ANIMAL MEDICINES EVER KNOWN AS "DAYS'."

The No. 2 MEDICINE CHEST contains the following matchless remedies:—

- | | |
|---|--|
| 'THE CHEMICAL EXTRACT,' for Cuts, Bruises, Sore Udders, and Ewes Lambing. | 'THE GASEODYNE,' for Parturition in Mares, Ewes, &c. |

| 'THE RED DRENCH,' for Cleansing after Calving and Lambing, Fevers, &c. | 'THE ALCOHOLIC ETHER,' for Colds and Chills. |
| 'THE RED PASTE BALLS,' for Conditioning Horses. | 'THE CARMINATIVE CHALK,' for Diarrhoea in Lambs and Calves. |

PRICE OF CHEST, with GUIDE to FARRIERY £2 16s. 6d.

No. 1 COMPLETE MEDICINE CHEST, £6 6s., Carriage Paid.

USED FOR OVER FORTY YEARS THROUGHOUT THE UNITED KINGDOM AND THE BRITISH COLONIES.

THE KOSSOLIAN SALT OR BLOOD SALT,

FOR HORSES, COWS, OXEN, SHEEP AND CALVES.

Its saline and ferruginous elements prevent languor, exhaustion, want of energy, and loss of appetite. All animals should have an ounce or two of the

KOSSOLIAN OR BLOOD SALT

mixed with their food once or twice a week, from the hunter down to the carriage horse and hack. All young animals, whether colt, calf, or lamb, should have half an ounce of the

KOSSOLIAN OR BLOOD SALT

mixed with their food, for it is a safeguard against contagious diseases, and it is destructive to the parasites in the bronchial tubes, causing that distressing malady the Hoose or Husk. It converts the food, while in the stomach, rapidly into flesh and bone making elements, and gives a firmness to the flesh to resist all poisonous effluvia; and it also renders all animals capable of enduring with safety the heat of summer, and the cold rains and sleet of winter.

Sold in Boxes, containing one dozen packets, price 12s.

DAY, SON & HEWITT,

22, DORSET STREET, BAKER STREET, LONDON, W., and WANTAGE, BERKS.

ESTABLISHED 1834.

SALAP MISREE PERSIANA,

OR

PERSIAN FOOD FOR INFANTS, INVALIDS, AND CONVALESCENTS

(REGISTERED).

It is Highly Nutritious. Its Nutrient and Strengthening Properties are in a Condensed or Concentrated Form. It is most easy of Digestion. Is alike agreeable to young or old. Is a Non-irritating Tonic.

FOR LADIES NURSING this preparation is most acceptable, as it not only enables the patient to take a sufficient amount of nourishment without overloading the Stomach—which under the circumstances is naturally irritable, thereby SUPERSEDING the ordinary gruel diet, so very distasteful to many—but it supplies in a high degree all the necessary ingredients for REARING the YOUNG. In derangements of the Stomach, so common to INFANTS, especially in cases of Diarrhoea, it will be found INVALUABLE. Those who suffer from Dyspepsia, and its many ills, will hail it as a boon. It is recommended by many of the most eminent Members of the Medical Profession.

Opinion of the late W. B. O'SHAUGHNESSY, M.D., F.R.S., &c., Bengal Medical Service, late Professor of Chemistry and Materia Medica in the Medical College, Calcutta, E.I.

"Two Drachms afford a sufficient meal for an Invalid. Good Salap Misree, carefully prepared, is in truth one of the Best Articles of diet a Convalescent can use."

TESTIMONIAL.

"GENTLEMEN,—For years I was a victim to the quackery of pills and patent medicines, but now I have renounced them all, and with good reason too. As soon as I found that your *Salap Misree* was not only a health restorer but a succulent and pleasant food, I threw physic to the dogs; and now I am a hale, hearty, happy man.—Truly yours,

"J. T. GORDON.

"To Messrs. FERRIS & Co."

TESTIMONIAL.

"I can heartily recommend your *Salap Misree* to those who, as I did myself, suffer from Indigestion and its accompanying horrors. The food is easily prepared, is pleasant to the taste, and is an excellent stomachic. I intend never to be without a supply of it in my family.—I am, your obedient servant,

"JAMES H. WILSON.

"To Messrs. FERRIS & Co."

TESTIMONIAL.

"GENTLEMEN,—I am bound to tender you my most hearty thanks for the very substantial benefits I have derived from the use of *Salap Misree*. For some years my food would not properly assimilate, and as a last resource I tried your Persian Food. Now my stomach is strong, and the result is that I am in sound bodily health and in good spirits.—Faithfully yours,

"THOMAS FORDHAM,

"To Messrs. FERRIS & Co."

Sold in Bottles, 2s., 3s. 6d., and 10s. 6d. Directions on each.

SHUTTLEWORTH, CARDER & CO.
 Have great pleasure in offering the above beautiful new species.

The numerous brilliant red and yellow flowers render it one of the most charming of cool conservatory climbers. *Full description by Dr. Masters in the Gardener's Chronicle for Jan. 21, 1882, p. 76.*
Strong Plants are now offered, price 21s., 42s., 63s. each. Also strong plants of BOMAREA CONFERTA, 10s. 6d., 15s., 21s., and 42s. each.
" CARDIERII, 5s., 7s. 6d., and 10s. 6d. each.
EUCHARIS CANDIDA, flowering plants, three and four bulbs in a pot, 5s., and 7s. 6d. each.

SHUTTLEWORTH, CARDER & CO.,
ORCHID and NEW PLANT IMPORTERS, 191, PARK ROAD, CLAPHAM, S.W.

NEW POPULAR WORK ON GARDENING.

Now ready, Crown 8vo, Cloth, Price 6s. 6d.,
EPITOME OF GARDENING
 By THOMAS MOORE, F.L.S., F.R.H.S., Curator of the Botanic Gardens, Chelsea;

With an Introductory Chapter on the Principles of Horticulture, by MAXWELL T. MASTERS, M.D., F.R.S. Illustrated with upwards of 200 Woodcuts.

"The quality of this book differs widely from what we are accustomed to in ordinary garden manuals. It is eminently practical and very thorough, giving every information as to the best arrangement of a garden and the right cultivation of plants and flowers. Its value is much enhanced by Dr. Masters' able scientific chapter on 'The Principles of Horticulture.' Taken altogether, this *Epitome of Gardening* is quite the best book of the kind we have seen for a long time."—*Athenaeum*.

"We need say no more in praise of a book which has been most carefully and intelligently prepared for popular use."—*The Queen*.

BEIGATE SILVER SAND—Coarse and fine, on rail at 7s. 6d. per ton, not less than 4000 trucks. Terms cash.—Apply to H. SIMS, The Friary, Keigate.

WEEDS, HOW TO DESTROY THEM.
 Use SMITH'S celebrated WEED KILLER, 4 gallons of which, sufficient to make 100 gallons when mixed with cold water, sent as a sample, carriage paid, price 7s. 6d. Thoroughly destructive to all vegetable growth.
 Manufactured only by **MARK SMITH, Chemist, Louth, Lincolnshire.**

Hydro-Carbon Oils as Insecticides and Washes for Plants and Animals.

SOLUBLE
FIR TREE OIL INSECTICIDE.

Bottles, 1s. 6d., 2s. 6d., 4s. 6d., and 9s. 6d.; Gallons, 12s. 6d.; Casks, 11s. per gallon.
 It destroys all insect pests on plants and fruit trees, whether at the roots or on the foliage, and it destroys all parasites and fungoids which infest animals and human beings. It is free from poison, very clean and pleasant in the using. It is the cheapest insecticide ever produced.

Testimonial.
WILKESLEY GARDENS, February 15, 1882.
MR. HUGHES—Sir,—Please send me at once 1 gallon Fir Tree Oil. I have again tried the above, and believe it to be what has been said of it. My previous disappointment with it was on account of its not being stirred sufficiently.—Yours, &c., **H. TISSINGTON.**
 From all Seedsmen and Chemists. Manufactured by **E. GRIFFITHS HUGHES, Operative Chemist, Victoria Street, Manchester.**

GISHURST COMPOUND.—Used by many of the leading Gardeners, since 1859, against Red-spider, Mildew, Thrips, Greenfly, and other Blights, in solutions of from 1 to 2 oz. to the gallon of soft water, and of from 4 to 16 oz. as a winter dressing for Vines and Fruit Trees. Has outworn many preparations intended to supersede it. In Boxes, 1s., 3s., and 10s. 6d.

A MERICAN BLIGHT ON APPLE TREES
CURED by rubbing a wet hard Painter's brush on Gishurst Compound, and working the latter into the infected part.

GISHURSTINE keeps feet dry, softens hard boots, preserves leather, takes a polish. In Boxes, 6d. and 1s. each.
 Wholesale by **PRICE'S PATENT CANDLE COMPANY (Limited)**. Retail by Seedsmen and Oilmen.

2-WHEEL HAND GAPING DRILLS.
 Will show every description of Farm and Garden Seeds.
 There is no spring and slide to get out of order and damage the seed, being worked by a brush. The rows can also be put in at equal distances without a line.
 Prices, with 2 wheels, 20s. each, with 1 wheel, 16s. each, to sow rows, 12s. 6d. each.

For larger Manual and Pony Drills, see Illustrated List free from **F. BIRD & CO.**, 21, Great Castle St., Regent St., London, W.

NEW CRIMSON and YELLOW BOMAREA.
BOMAREA SHUTTLEWORTHII.

SHUTTLEWORTH, CARDER & CO.
 Have great pleasure in offering the above beautiful new species.

The numerous brilliant red and yellow flowers render it one of the most charming of cool conservatory climbers. *Full description by Dr. Masters in the Gardener's Chronicle for Jan. 21, 1882, p. 76.*
Strong Plants are now offered, price 21s., 42s., 63s. each. Also strong plants of BOMAREA CONFERTA, 10s. 6d., 15s., 21s., and 42s. each.

TESTIMONIALS.

From J. SPENDER CLAY, Esq., Ford Manor, Lingfield, Surrey, August 9, 1880.

"In reply to your letter of inquiry, I am glad to be able to say that the two Hydraulic Rams which you fitted here are working satisfactorily, and list out of 13 gallons 3 quarts per minute, the maximum power of the spring, they deliver to the top of my 40 ft. tank 100 ft. from the spring, 4 gallons a quart per minute, or 672 gallons per twenty-four hours, being 120 gallons above the quantity you guaranteed."

From Captain TOWNSEND, Wincban, February 10, 1877.

"In answer to your inquiry, I am glad to say the Hydraulic Ram you sent me in November, 1875, is working exceedingly well, and gives no trouble. It will work when quite immersed, as it has been several times during the floods this winter, forcing up water through a delivery pipe 500 yards long, at the rate of 80,000 gallons per day, although you only promised 50,000."

From the Rt. Hon. the Earl of ROMNEY, 56, Eaton Place, S.W., June 12, 1880.

"Sir,—In reply to your inquiry, I have pleasure in stating that the Hydraulic Ram which you erected for me at Givton does its work remarkably well, and is a great success. I think the work is especially creditable to you on account of the very small fall of only 1 ft. with which you had to deal, and I shall always be glad to recommend you—Yours faithfully, ROMNEY."

From Captain GANDY, Castle Bank, Appley, February 11, 1880.

"The Self-acting Hydraulic Ram you erected for me is an excellent example of strength and good workmanship. Whilst working with a 7 ft. 4 in. fall, it forced water 71 ft. high, and is doing me every satisfaction. It will do more work in one day than the old Ram of another make could do in a week."

From V. F. BENETT-STANFORD, Esq., M.P., Pyt House, Tisbury, Wilts, August 29, 1880.

"I have no hesitation in saying my self-acting Hydraulic Ram, and apparatus for extending the supply, which you laid down here, and which you have so kindly and so very satisfactorily. The Ram forces upwards of 2000 gallons per day to a service reservoir holding 25,000 gallons at an elevation of 275 feet above the roof of the house, from which reservoir the water is distributed to the house, stables, horse barn, and several cottages, and in 1878-9, four jets can be thrown on the house from different sides, at a great force, and large volume. I consider your work has been done well and efficiently, and does you credit."

From the Rt. Hon. the Earl of GRANARD, Castle Forbes, March 1, 1880.

"The Hydraulic Ram erected for me at Castle Forbes has answered perfectly. Considering the very small fall attainable by the nature of the ground, it is a great success, and throws up water to a cistern on the top of the tower 55 ft. high. When Mr. Blake first proposed to put it up I doubted the possibility of its succeeding, owing to the nature of the ground; but I have been most agreeably undeceived."

From Sir ROBERT MENZIES, Bart., of Menzies, Rannoch Lodge, Rannoch, August 20, 1880.

"The Hydraulic Ram you fitted for me to supply water to Rannoch Lodge and Camerich, two houses three quarters of a mile apart, is a complete success. The extreme distance the water is carried is 1 1/2 miles, and though the elevations of the two houses are different, there is a regular supply of seven quarts per minute to each house, which has never ceased since the Ram was set going, about three months ago. Your Ram took the place of one previously tried on the same spot, which did not succeed, and was in fact a complete failure."

JOHN BLAKE, ENGINEER, ACCRINGTON, LANCASHIRE.

Is now being used extensively by all the principal Nurserymen, Market Growers and Gardeners throughout the United Kingdom with the most remarkable success, and has established a reputation never obtained by any other Manure.

CAUTION.—It having come to our knowledge that some unprincipled persons have been substituting other Manures for Clay's Fertiliser, we beg to state that we guarantee the genuineness of none except in our bags, marked:—

GARDENING WITH PROFIT

CAN ONLY BE ATTAINED BY A FAIR AMOUNT SPENT IN

GLASSHOUSES AND HEATING.

With these appliances judiciously planned, well constructed, and ably managed, the largest Household, whether living in Town or Country, can be supplied with all its Fruits, Flowers, and Vegetables at little cost.

ORCHARD-HOUSES, VINERIES, PLANT-HOUSES and FRAMES Erected with BEST QUALITY ONLY of Materials, Glazed with English Glass, without the use of outside Putty.

The Best Vertical Boiler is
THE MONARCH
 (A New Patent),

Combining an Inner UPRIGHT TURBULAR and an Outer CONICAL BOILER, made of Wrought Iron, to avoid the risk of damage and failure attached to Cast Iron ones.

Accompanying section shows it set in brickwork, with outer flues, but these are not necessary; and as an

INDEPENDENT BOILER, requiring NO brickwork at all, it will be found most economical and powerful, in a very small compass.

The Best Horizontal Boiler is
BEN'S BOILER
 (Registered)

(Royal Hort. Soc's Medal, 1881),

and combines the common Saddle, Terminal and Flued Boilers, with the advantage of its specially secured characteristic, a L-shaped Crossbridge, which sends the hot water directly into the flowpipe.

Ordinary Crossbridges are of no use, and quickly fall up, as they only cause the water to boil inside without benefit to the general circulation.

One BEN'S BOILER (7 feet long only) now heats 7000 feet of piping.

The "PAXTON" Patented Independent Boiler, for 600 feet and upwards. The "LONDON" Independent Wrought Boiler for Amateurs' Greenhouses to build in wall or wood framing, to heat 200 feet of 2-inch pipe, £3 10s. "ALEXANDRA" Gas Boilers with New Condensing Arrangement. Gas Stoves. Portable Joint Hot-water Pipes.

HEATING APPARATUS (Large or Small) FIXED COMPLETE.

MEAD'S Patent Reflex GARDEN SEAT, TABLE and AWNING combined. Garden Seats, Vases, &c.

Patent "ECLIPSE" Glazing with Indestructible Lead Bars instead of Zinc.

Illustrated CATALOGUES and CIRCULARS free; also ESTIMATES for any such work on receipt of particulars.

Gardens visited, dimensions taken, and instructions received personally.

B. W. WARHURST,

Horticultural Engineer (Successor to HEREMAN & MORTON, formerly of Pall Mall and Tichborne Street)

33 (and 81A), HIGHGATE ROAD, LONDON, N.W.

THE "AUTOMATON."

FOR GENERAL PURPOSES.

The "AUTOMATON" Lawn Mowers are thoroughly strong, well-made, and durable machines, and the best suited for general work and Gardeners' use. They cut the grass perfectly, leave no ribs, but produce a smooth, velvety surface on the lawn, and are light in draught.

They will either collect the cut grass in the box or leave it on the lawn, as preferred.

The "AUTOMATONS" have front rollers for general work, and side rollers for cutting long grass, or when it is unnecessary to roll the grass in front of the cutters. They have the best machine-made gearing, the best knives of steel and iron rolled together, and an automatic silent action.

PRICES.

Boots for Donkey, 20s. per set.

THE "HORSE-POWER."

The "HORSE-POWER" Lawn-mowers are made from new designs, embodying many improvements, and are believed to be the very best machines yet introduced. They are suitable for large Lawns and Pleasure-grounds, Cricket-grounds, Arboretums, and Lawn Tennis-grounds, Bowling-greens, the Borders of Parks and Drives, &c.

They can be fitted with patent side-delivery apparatus, to be worked from the handles, and also with seat for the driver to ride, particulars and prices of which will be sent on application.

PRICES.

THE "REVERSIBLE."

The "REVERSIBLE" LAWN MOWERS have a roller behind the knives and roll the grass as well as cut it. They collect the cut grass in the box in front, or scatter it as preferred. The handles adjust themselves to the height of any person.

The "REVERSIBLES" can be worked either side inwards, which reverses the action of the cutting barrel, and brings a fresh set of edges into use. They are fitted with side rollers. The cutting barrel runs in renewable brass bushes, and the ledger blade can be adjusted to the knives.

PRICES.

With Grass Box, 6-in., 30s.; 8-in., 40s.; 10-in., 50s.
Without " " 27s.; " 36s.; " 45s.

THE "GLOBE."

The "GLOBE" Lawn Mowers are intended for cutting long grass; and which, whilst similar to the Lawn Mowers imported from America, have the special advantages of the more accurate fitting and general durability of English manufacture, and perfect adjustment.

They have a cutting barrel which is large and open, with three knives, and is simply adjusted by top and bottom screws.

The knives are made of steel and iron rolled together, and are not liable to be broken by any hard substance like cast-iron cutters, nor loosen like knives which are only screwed on.

The "GLOBES" will cut wet, dry, long or short grass without clogging, and cut off almost all the "beats."

PRICES.

"THE COVENTRY."

(REGISTERED).

NETTLEFOLD & SONS desire to call especial attention to their "COVENTRY" LAWN MOWER, which they can confidently recommend as the best and cheapest in the Market. It has all the improvements which have of late been introduced into this class of Machine, either in England or America; and for the manner in which it does its work, its lightness, and the ease with which it can be used, cannot be surpassed. Its cheapness brings it within the reach of every one, and in this respect it defies competition with any American machine before the public. It is made, as its name implies, at Coventry, by skilled English workmen, and of best English Steel and Iron. These Machines can also be supplied with ROLLERS at SAME PRICE, and GRASS BOXES at a small extra cost.

MANUFACTURED BY

THE "NOTTINGHAM"

£10 GREENHOUSE,

AS ABOVE, is a lean-to for brickwork. The dimensions are 12 feet long, by 8 feet wide, with 2 feet 6 inches of wood and glass upon the front wall. It has two glazed ends, in one of which the door (as shown in the illustration) will lock fitted on. It is ventilated in the roof by a casement with all necessary apparatus to open, by a cord and pulley, as well as two casements opening in the front. The house is made of good red deal, all fitted together so that any handy man (not necessarily a joiner) can specify put it together. We deliver it to any railway station in England, and send with it included in the price, the 15-oz. glass cut to the dimensions, the putty and the spout and down-pipe. All the wood and ironwork has one coat of paint before sending away.

Geo. NEIGHBOUR and SONS, 127, High Holborn, W.C., and 149, Regent Street, London, W.

ADIE'S PATENT LAWN EDGER.

This Machine constantly employed will pay itself in two days. Dr. Hogg, in the *Journal of Horticulture*, says—"This Edge Clipper we have tried, and know not which to admire most—its simplicity or efficiency." Mr. Moore, in the *Florist*—"This new machine does its work rapidly and admirably, the grass being cut with precision, and" he further adds, "the use of it will, we have no doubt, become general."
PALL MALL LAWN EDGER CO., 15, Pall Mall, London, W.

THE HANDBOOK OF THE FARM SERIES.

Edited by J. CHALMERS MORTON.

Editor of the *Agricultural Gazette*.

THE FOLLOWING VOLUMES ARE NOW PUBLISHED,
PRICE HALF-A-CROWN EACH:

THE CROPS OF THE FARM.

By T. BOWICK, J. BUCKMAN, W. T. CARRINGTON, J. C. MORTON,
G. MURRAY, and J. SCOTT.

THE LIVE STOCK OF THE FARM.

By W. T. CARRINGTON, G. GILBERT, J. C. MORTON, GILBERT MURRAY,
SANDERS SPENCER and J. WORTLEY AXE.

THE CHEMISTRY OF THE FARM.

By R. WARINGTON, F.C.S.

NOTICES BY THE PRESS OF THE FIRST VOLUME OF THE SERIES:—

From the GARDENERS' CHRONICLE.

"Mr. Warington's little book appears very opportunely, at a time when a 'popular' book, in the best sense, on agricultural chemistry is demanded. The author deals in successive chapters with the characteristics of plant growth, the sources of plant food, the nature of manures, the several crops grown on the farm, the food to be given to the stock, and the chemistry of milk and its derivatives. If the remaining books are as well done as this is, and bear evidence in their degree of as much original work, the result will be creditable to English science, and can hardly fail of proving very beneficial to agriculture."

From the NORTH BRITISH AGRICULTURIST.

"If the contributors to the other volumes deal with their subjects as intelligently and instructively as Mr. Warington has dealt with his, the Editor and his assistants will have to be congratulated on the success of their labours and enterprise. We sincerely trust that this may be the case, and have pleasure in recommending with confidence Mr. Warington's book, not only to teachers, but to students, and especially to farmers who may consider themselves past the age of attending agricultural classes profitably and conveniently."

From the FARMER.

"The first of what promises to be the finest series of farm hand-books that has yet been issued in this country, or, in fact, in the English language. The little hand-book is one that cannot fail to be useful, and we hope the whole series will find their way to the library shelves of all our readers."

From LAND.

"This is a concise and useful manual, forming one of a series of hand-books adapted to meet the wants of the teacher and the student of agriculture. The number of persons who stand in need of a formal manual, by reason of their connection with our agricultural schools and colleges, has greatly increased, and there is every reason why we should keep abreast of the Germans in the formal and scientific treatment of a subject interesting to an important national interest."

From the LIVE STOCK JOURNAL.

"The chief merit of the book is that it is written up to the times, a very important consideration, remembering that our knowledge of agricultural chemistry is growing 'from more to more,' with greater rapidity than is the case with older branches of science, where the ground has been broken up for many a long year."

HOT WATER PIPES AND BOILERS. CHARLES P. KINNELL & CO., IRONFOUNDERS, 31, BANKSIDE, LONDON, S.E.

Oil Paint No Longer Necessary. HILL AND SMITH'S BLACK VARNISH for Preserving Ironwork, Wood, or Stone. (Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertiser, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale.

UNSOLICITED TESTIMONIAL. "Pierceland Park, June 21, 1876.—Sirs,—I have this day forwarded from Chestnut to your address a black varnish cask, to be filled and returned with as good Varnish as the last we had, which I candidly admit was the best we ever had. Address Varnish to Pierceland Park, Chestnut.—I am, Sirs, yours respectfully, Wm. Cox." CAUTION.—Hill & Smith would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'s Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade mark as above, without which none is genuine.

Large Illustrated CATALOGUE of Flower Borders, Field and Entrance Gates, &c., sent free on application to HILL AND SMITH, Briery Hill Ironworks, Staffordshire; 118, Queen Victoria Street, London, E.C.; and 180, Buchanan Street, Glasgow.

L. REEVE AND CO., 5, Henrietta Street, Covent Garden, W.C.

WE WERE BALD, BUT WE USED WARDE'S CAPILLARE AS A DAILY DRESSING FOR OUR HAIR.

THE **DOCTOR CIRCULAR** (under Royal Patronage) says:—"The preparations before me are public for the fanciful purpose of facilitating the growth of hair are so numerous that information in regard to a really genuine article must meet with satisfaction. We have seen the effect of

WARDE'S CAPILLARE upon a lady's head which had become almost bald—the result of sickness. After perseverance with

WARDE'S CAPILLARE our fair friend regained possession of her lost tresses, which are, in result, now more profuse than before.

WARDE'S CAPILLARE is equally a friend to the sterner sex, as it has, to our knowledge, made whiskers and moustaches grow after nearly every other advertised preparation had signally failed. For which latter purpose it is used as brilliant. The active principle set in motion by the judicious combination of the hair-growing properties met with in

WARDE'S CAPILLARE (which is harmless, stainless, and transparent, and contains no oil), renders it at once a complete specific, so that a "thoroughly hygienic article"

WARDE'S CAPILLARE, "cannot be gainsaid, and it must take its place as the best and empiric and therapeutic remedy of the day for loss of hair."

WARDE'S CAPILLARE, which is adapted for Infants' as for Adults' Use, stimulates apparently decayed hair bulbs, and so acts upon the sudatory functions as to produce an entirely new growth that it prevents dandruff, and makes a most refreshing hair wash, one teaspoonful to half a pint of water being sufficient; and that it counteracts the deteriorating effects of hot climates upon the hair.

WARDE'S CAPILLARE, 2s. 6d. and 4s. 6d. per bottle; three, 7s. or 12s. 6d.; six, 12s. 6d.; or 21s.; dozen, 25s. or 45s. Of Chemists, Perfumers, and Hair-dressers, everywhere; or, 72d. free (United Kingdom), upon receipt of remittance, of WARDE & CO., Great Marlborough Street, London, W. Sent to any part of the world.

ROBINSON & CLEAVER & COLLINS, BELFAST.

Paul and Son's above capacity. Efficient Correspondent and Book-keeper.—F. A. RICHE, 12, Pelham Road, South Wimbledon, S.

BOOK-KEEPER.—Age 26; eleven years in the Nursery and Seed Trade. Good references.—A. T. G., 14, Queen's Road, Bayswater, London, W.

By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, MR. EPPS has provided our breakfast tables with a delicately-flavoured beverage which may save us many a heavy doctor's bill by the judicious use of such articles of diet that constitute may be gradually built up until soundness of constitution and every element of disease. Hundreds of subtle maladies are arising around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame.—WOLF BRAND, & Co., Great Street, London.

EPPS'S COCOA.

GRATEFUL AND COMFORTING.

Made simply with boiling water or milk. Sold only in packets, labelled, JAMES EPPS AND CO., HOVE PATENT CHEMISTS, London.

Makers of Epps's Chocolate Essence for Afternoon use.

HOLLOWAY'S PILLS are the medicine most in repute for curing the multitudes of maladies which attack humanity when wet and cold weather gives place to more genial temperatures. In short, these Pills never fail to relieve the first class of distempers of the system, and to allay the nervous energy, which at times oppress a vast portion of the population. Under the wholesome, purifying, and strengthening powers exerted by these excellent Pills, the tongue becomes clean, the appetite improves, digestion is restored, and a soundly rendered perfect. Holloway's medicine possesses the highly estimable property of restoring the whole mass of blood, which in its renovated condition carries purity, strength, and vigour to every tissue of the body.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING and COLLECTING MACHINES for 1882.

THE WINNERS OF EVERY PRIZE IN ALL CASES OF COMPETITION.

Patronised by Her Most Gracious Majesty the Queen on many occasions, His Royal Highness the Prince of Wales, the King of the Belgians, the late Emperor of the French, the Emperor of Russia, and most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "Journal of Horticulture," of June 9, says:—"MOWING MACHINES.—After a critical examination the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. Green & Son, of Leeds and London. As the machines are known in all lands where good laws are cherished, it is quite unnecessary to give any description of them."

Upwards of 105,000 of these Machines have been Sold since they were first introduced in the year 1856, and Thousands of unsolicited Testimonials have been received testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off every Prize that has been given.

The following are their advantages over all others:—

- 1st. Simplicity of Construction—every part being easily accessible.
- 2d. They are worked with much greater ease than any other.
- 3d. They are the least liable to get out of order.
- 4th. They make little or no noise in working.
- 5th. They will cut either short or long Grass, wet or dry.

Single-handed Lawn Mower.

To cut 6 inches	Price £1 15 0
Can be worked by a Lady.	
To cut 8 inches	2 10 0
Can be worked by a Lady.	
To cut 10 inches	3 10 0
Can be worked by a strong Youth.	
To cut 12 inches	4 10 0
Can be worked by a Man.	
To cut 14 inches	5 10 0
Can be worked by a Man.	

Double-handed Lawn Mower,

To cut 16 inches	Price £6 10 0
This can be worked by One Man on an even lawn.	
To cut 18 inches	7 10 0
By a Man and Boy.	
To cut 20 inches	8 0 0
By a Man and Boy.	
*To cut 22 inches. By Two Men ...	8 10 0
*To cut 24 inches. By Two Men ...	9 0 0
*It made stronger, suitable for Donkey, gas, extra.	

Prices of Donkey, Pony, and Horse Machines, including Patent Self or Side Delivery Box, with Cross-stay complete, suitable for attaching to Ordinary Chaise Traces or Gig Harness:—

DONKEY and PONY MACHINES.

To cut 26 inches	£14 0 0
To cut 28 inches	16 0 0
To cut 30 inches	18 0 0
Leather Boots for Donkey	1 0 0
Leather Boots for Pony	1 4 0

HORSE MACHINES.

To cut 30 inches	£22 0 0
To cut 36 inches	26 0 0
To cut 42 inches	30 0 0
To cut 48 inches	34 0 0
Leather Boots for Horse	1 9 0

The 26 and 28 inches can easily be worked by a Donkey, the 30 inches by a Pony, and the larger sizes by a Horse; and as the Machines make little noise in working, the most spirited animal can be employed without fear of its running away, or in any way damaging the Machine.

GREEN'S PATENT "MULTUM IN PARVO" LAWN MOWER.

PRICES.

Without Grassbox.

To cut 6 in.	£1 1 0
To cut 7 in.	1 8 0
To cut 8 in.	1 15 0

This Mower is specially designed to meet an almost universal want experienced by those who have small lawns or grass plots, to have a good and useful machine at a low price. The inventor having seen this want continually increasing, year by year, has brought out the Mower to meet the requirements of the public by supplying a good and useful machine at a cheap rate.

It is simple in construction, easily adjusted, is well adapted for mowing small plots, cutting borders, verges, round flower beds, the edges of walks, &c.; it is a most handy, serviceable machine, and very easy to work.

PRICES.

With Grassbox.

To cut 6 in.	£1 5 0
To cut 7 in.	1 13 0
To cut 8 in.	2 0 0

GREEN'S PATENT GRASS EDGE CLIPPER.

Specially designed to cut the overhanging grass on the edges of walks, borders, flower beds, &c., and to do away with the tedious operation of cutting with shears.

SIZE and PRICE.

Wide.	Diam.
8 inch	7 inch
Packing Case, 2s.	

GREEN'S PATENT LAWN TENNIS COURT MARKER.

This Machine is of novel design and construction, and the simplest and most effective in its operations.

In the trough containing the liquid there is a loose drum which revolves when the machine is in motion, and conveys the marking material to the intermediate pulley, which in its turn transmits it to the front one, so that the ground is marked effectively as the machine is pushed along.

Price, 21s.

Small Bag of Patent Marking Composition, 11d. and Packing, 1s. 6d.

Delivered, Carriage Free, at all the principal Railway Stations and Shipping Ports in England, Scotland, and Ireland.

No Lawn Mower Manufacturer keeps so large a stock of Mowers as is to be found at our London Establishment, 53 and 55, Blackfriars Road, where purchasers can select out of several hundred Machines, of Hand, Pony, and Horse Power, and have their Orders executed the same day they are received.

The above Machines are Warranted to give entire Satisfaction, otherwise they may be returned AT ONCE, free of cost to the Purchaser.

N.B.—Those who have Lawn Mowers which require repairing should send them to either our Leeds or London Establishment, where they will have prompt attention, as an Efficient Staff of Workmen is kept at both places.

Garden Seats and Chairs, and Horticultural Implements of every description, Wire Netting, &c., &c.

Descriptive Illustrated Price Lists free on application to

THOMAS GREEN & SON (Limited), Smithfield Ironworks, Leeds; and 54 and 55, Blackfriars Road, London.

GRASS SEEDS

FOR LAWNS,

Of the finest close-growing Evergreen kinds, 12. per lb. Special preparations for all purposes, soils, and situations. Advice gratis.

Unsolicited Testimonials:—

"Knowing how difficult it is to obtain pure stocks of grass seeds, even when price is a secondary consideration, I write to say the supply I obtained from you for our terrace lawns has given the greatest satisfaction."

"Please send me three bushels of the very best Lawn Grass Seeds, suitable for an exceedingly hot upland soil. . . . The seed I have had of you has been the only kind which has been able to resist the influence of the sun and drought upon my soil, gravely soil."

FARM SEEDS

Of all kinds, which have given unequalled satisfaction. See Illustrated and Descriptive LIST, free on application.

UNSURPASSED FLOWER and VEGETABLE SEEDS. LIST Free by Post.

H. CANNELL & SONS,

EXHIBITION OF ORCHIDS.

B. S. WILLIAMS

Has much pleasure in announcing that he has determined to make a grand show of his flowering ORCHIDS, during the next two months, at home. The Exhibition will include, in addition to the usual stock of young Flowering Plants, all the grand specimens that he has been in the habit of including in his Collections, which have obtained the leading prizes for many years both at home and abroad.

Patrons of Horticulture are especially invited to inspect this Exhibition.

The Exhibition will contain large and small specimens of ODONTOGLOSSUMS, CATTLEYAS, LÆLIAS, ONCIDIUMS, CYPRIPEDIUMS, MASDEVALLIAS, VANDAS, AERIDES, SACCOLABIUMS, and other rare and showy ORCHIDS.

AN EARLY INSPECTION IS RESPECTFULLY INVITED.
NO CARDS TO VIEW REQUIRED.

A hearty welcome will be given to all who honour us with a visit.

CARRIAGE ROUTE.

Carriage Route from the West End is through Albany Street, Regent's Park, Park Street, Camden Town, Kenish Town, and Junction Road.

The North Metropolitan Tramway Cars, in addition to the Street Tramways Company's Cars, arrive at and start from the Nurseries, for the City and West End, every few minutes.
The Great Northern Main Line trains all stop at Holloway Station, which is within fifteen minutes' walk of the Nurseries. The Midland and Great Eastern Main Line trains all stop at Kenish Town Station, which is within ten minutes' walk of the Nurseries. The Midland, in connection with the Metropolitan Railway, runs frequent Trains during the day from all parts of London to Upper Holloway Station, which is within three minutes' walk of the Nurseries.

SEVENTY-FOUR ACRES OF FRUIT TREES—Apples, Pears, Plums, Cherries, Peaches, Nectarines, Apricots, and other Fruit Trees, at Standards, Dwarf, Pyramids, Bushes, Gordon and Trent trees, extra strong, all full of vigour and warranted true to name. Descriptive Price LIST, containing a sketch of the various forms of Trees, with Directions for Cultivation, Soil, Drainage, Manure, Pruning, Lifting, Cropping, Treatment under Glass; also their Synonyms, Quality, Size, Form, Skin, Colour, Flesh, Flavour, Use, Growth, Duration, Season, Price, &c., for 1d. stamp.

TWELVE ACRES OF ROSES.—Standard, Dwarf, and Climbing, all the popular varieties, free of choice Tea-scented and Noisette Roses in pots; extra strong Roses in pots for immediate forcing.
See Descriptive Price LIST, free for 1d. stamp.

TWO HUNDRED THOUSAND HERBACEOUS and ALPINE PLANTS for Borders, Rock-work, &c. See Descriptive LIST, giving colour, height, time of flowering, &c., free by post for 1d. stamp.
R. S. & Co.'s selection of too good showy varieties for 25s.

GRAPE VINES and ORCHARD-HOUSE TREES in POTS.—**GRAPE VINES**, extra strong, short-jointed and well-ripened Planting Canes, 3s. 6d. to 15s. each; extra strong Fruiting Canes, 7s. 6d. to 10s. 6d. **ORCHARD-HOUSE TREES**, Fruiting in Pots, consisting of Peaches, Nectarines, Apricots, Plums, Cherries, Pears, Apples, and Figs. Descriptive Price LIST for 1d. stamp.

LIST of all the EVERGREEN FIR TRIBE, suitable for Britain, giving size, price, popular and botanical names, derivations, description, form, colour, foliage, growth, timber, use in arts, native country, and size there, situation, soil, and other information, with copious index of their synonyms. Free by post for six stamps.

LIST of EVERGREEN and DECIDUOUS SHRUBS, RHODODENDRONS, STANDARD ORNAMENTAL TREES, CLIMBING and TWINING PLANTS, with their generic, specific, and English names, native country, height, time of flowering, colour, &c., and general remarks, free for a penny stamp.

ALL KINDS of GARDEN SEEDS, of first quality. **BULBS**, **RHODODENDRON SPRAWN**, **TORONTO PAPER**, **ARCHANGEL MATS**, and other **GARDEN REQUISITES**. See **LISTS**, which may be had on application.

SEAKALE.—Extra Strong, for Forcing, 2s. 6d. per dozen, 16s. per 100.

New Coleus "Crimson Velvet."
EDWIN COOLING has much pleasure in calling attention to the above splendid novelty. The colour of the leaf is bright crimson, veined with darker crimson, and remarkably rich and velvety in appearance. The habit is very free and compact. As a pot plant for the decoration of the greenhouse it is unequalled, and in warm situations will take a high rank as a bedding plant. Strong plants now ready, 3s. 6d. each. A specimen leaf will be sent to any address on receipt of a stamped and directed envelope.
EDWIN COOLING, Mile-Ash Nurseries, Derby.

THE

Gardeners' Chronicle.

SATURDAY, MAY 20, 1882.

NORBURY PARK.

TWO hundred years ago that "fine old English gentleman"—justly called the pattern of his age—John Evelyn, of Witton, since known from the title of his best known work as *Sylva* Evelyn—used occasionally to walk over to this village from his country house; and here, quoting his own words Sir Francis Stidolph received him, "among his goodly walks and hills shaded with Yew and Box." This is the earliest incident connected with Norbury that need be noticed. The next matter of interest in relation to landscape gardening concerns the Park. There are 300 acres of park in the gorge of the Mole, which passes through it with many a graceful bend, the chalk hills and slopes on either side sweeping down into the valley. Even in Surrey you will not find such another park—

"Where up the sunny banks
The trees retire in scattered ranks,
Save where, advanced before the rest,
On knoll or hillock rears his crest,
Lonely and huge, the giant Yew,
As champion to his country true,
Stands forth to guard the rearward post,
The bulwark of the scattered host."

But lovely as the park is now, it was much less so a hundred years ago, when unsightly Walnut trees overcrowded it, and when the old Manor House stood by the river, in a bad, obscure position, where it remained, damp and low, till Mr. William Lock bought the place in 1774, abandoned the old house, and built a new one. The present house is an improved edition of that new one of the last century, and it occupies a site which could not be altered for the better. It was produced by the improvements of one of the builders of the Houses of Parliament, the grandfather of the present owner of Norbury Park, Mr. T. D. Grissell. And although Norbury owns an ancient history and boasts a Saxon Thane and a Norman knight among its possessors, the erection of a good house on one of the best sites in Surrey is a matter of more importance to the present generation than any other portion of its history.

Mr. Lock has been described as "the Meccenas of English literature and art," but we are here in sight of Deepdene, once the residence of Thomas Hope, author of *Anastasis*, and collector of the greater part of the costly art treasures of that superb abode, and I shall, therefore, be content to describe Mr. Lock as a man of sense who pulled down the old house in the bottom. The spot he selected for his new mansion is about 400 feet above the river, and well sheltered by Beech woods behind. It is not an inch too high, nor a hair's breadth too low, and it commands such a prospect as you will hardly find elsewhere even in Surrey. From the windows and the lawn before the house are seen a varied park with famous Yews and graceful Beeches, the village of Mickleham, with the river and the gabled rectory; Box Hill—that promontory of many hues changing with the sky—Denbies and Dorking, with Deepdene among the trees beyond, the avenues of Betchworth Park, and Leith Hill in the distance.

Another piece of curious history connected

with Norbury Park is the planting of the Walnut trees. Evelyn speaks of "the Walnuts innumerable" which covered the path, to the exclusion of that ornamental kind of timber which now render it delightful. There is no record of the exact date of the planting of these ugly orchard trees, but we are told that they yielded in good years £300 in Walnuts, and no doubt they were planted by one of the priors who preceded Sir Francis Sidolph at Norbury Priory.

A few scattered Walnut trees have been allowed to remain, as interesting mementos of the past, but the orchard generally was destroyed by Mr. Anthony Chapman, who immediately preceded Mr. Lock. The Beeches in the Park were not mentioned by Evelyn on the occasion of his visit, and, judging from the apparent age of most of them, they replaced the Walnut trees towards the end of the last century, though some of the trees are older. They are now the chief ornament of the Park, and when Mr. Downing, the gardener, had conducted me to a favourable point of view, he might well speak with enthusiasm of the many shades of their foliage during the earliest expansion of the leaf, and the part they play in the tumbled foreground of a most sweet landscape.

The Yews of the "Druids' Grove" are probably not much altered since the seventeenth century; some say they were in their prime at the Conquest. Some of them have been appropriately named as "The King of the Park," "The Fallen Giant," and "The Horse and his Rider." The Grove extends from near the house, athwart the hill-side, towards the village of West Humble. At Foxbury, the high-seated villa of Mr. Birkett, I fortunately trespassed on his domain on leaving the Park, and met with more than my deserts from that kind proprietor, who showed me his happily selected site, its lovely outlook on the hills, his lawn and shrubs, and much-prized purple Gentians, all of which he enjoys at eighty-one, and has fresh Roses in his cheeks, so healthful is the pure air here, which has enabled even age, as he assured me, to dispense with any other stimulus.

I did not count the Yews—they stand by thousands, nor measure them—they vary from small and spreading to very large and tall, one measuring 22 feet round I believe. "None of your small waists here!" says a local writer. The Druids are said to have walked here, as the monks of the Priory below certainly did. They are supposed to have walked in more unlikely places, as in Wistman's Wood, in Dartmoor, where they are said to have cut Mistletoe on a site far too rough and cold for that plant. The banks of the Mole suit it better, by the way, and numerous great bunches grow upon the Black Poplars opposite the Burford Bridge Hotel. I believe that artists find more "manageable" scenery within the confines of Norbury Park, than in the wider landscape outside, where the hills cannot easily be caught, and the country retreats many miles beyond reach. They find convenient Thyme banks, rounded knolls and heights, and pleasing sweeps of smooth turf. Then there is always a delightful background of trees, or single specimens, a Beech for instance—a capital study—reported 100 feet spread by 160 feet high. Any artist might revel in Norbury Park, where each scene, shrub and tree, Yew or Box, or younger Beech, is ready for his canvas, to express by perfect Art what is already perfect in Nature. H. E.

GENISTA HISPANICA.—This pretty little shrub is now one mass of yellow blossoms. It forms a dense hemispherical bush, and is at all times, from the arrangement of its rigid spinous branchlets, an elegant plant. It is found under various names in nurseries. In one of the leading London nurseries we lately saw it labelled *Ulex nanus*, which in others it is sometimes named *U. hispanicus*. A native of Southern France, Spain, and Portugal.

New Garden Plants.

BOMAREA FRONDEA, Mart., n. sp.

(Fig. 102, p. 669.)

THIS is a heretofore undescribed species, belonging to the same group as *B. Caldasiana*, and, indeed, so similar to it in the dried state that it has been confounded with it. It may, however, be readily distinguished by the stem being leafy all the way up to the base of the inflorescence, by the shorter flower-stalks, the larger and more trumpet-shaped flowers, the more elongated flower-segments, the wedge-shaped shortly acuminate inner segments tapering at the base into a relatively very long narrow stalk. The colour of the outer segments is rich yellow (lutescens) splashed with orange, while that of the inner segments is clear canary-yellow (flavus), with numerous small purplish-brown spots. Our material has consisted of dried specimens collected by Carder at or near Bogota, and of a coloured drawing made by the same collector. After comparison we also refer to the same species the specimens collected by Holton, n. 145, and by Triana, n. 271, in the same neighbourhood.

Messrs. Shuttleworth & Carder have stock of the plant, and if in cultivation it prove as good as in the wild state (and the probability is it will prove better), then it will form a decided acquisition even to this very handsome group of greenhouse climbers. There can be no doubt as to its superiority to *B. Caldasiana*, to which, as above said, it is nearly allied. *M. T. J.*

ARIDIS SUAVISSIMUM, Lindl.

The original variety, as represented in Paxton's *Flower Garden*, ii., 66, with the fine broad leaves, the short, strong, exceedingly dense raceme, the fine colours, and—what could not be represented—the delicious perfume—a combination of Poinsettias and honey, I might say. It is long since I have had flowers sent of this plant: I think it is nearly lost. Hence it is declared by many spectators to be new, as I am informed by the lucky possessor, Dr. Alex. Paterson. It has taken a very long time to grow, till it has arrived to its actual perfection, bearing five spikes at once, being 4 feet high. There is no doubt that, to judge from the leaf, it was neither exposed to great intensity of heat, nor light, nor air. I believe some species can be managed to flower in short time, but I doubt whether the plants would bear the excitement. I think the safer plan is the Patersonian—*to be patient, and to give the plant full time.* H. G. R. H. f.

FERNS AT ROCKVILLE, EDINBURGH.

As Mr. Neill Fraser is kind enough to allow those who care for the cultivation of Ferns to see his collection, it is well known to many; and as he gets Ferns from various parts of the world, there is always something of fresh interest, as well as many a specimen of successful culture to be seen. It would be difficult to find a better basket Fern than *Goniophlebium subauriculatum*, with, probably, over a hundred fronds, varying in length from about 4 feet to 9 feet, many of them perfectly pendulous. The plant is about 6 feet through, and has grown from a small plant to this size in three or four years. Another finely-grown Fern is *Platypeltis sporidicarpa*, 16 feet in circumference, with fronds over 4 feet long. Its glaucous foliage is good for contrast with other Ferns; but a much prettier Fern is *Peris scaberula*, very like a small and finely-cut *Davallia*: this plant is 4½ feet across. A very fine specimen of *Adiantum gracillimum*, one of the most beautiful of Ferns, is not yet in its full beauty, nor is a plant of *Lygodium scandens* (nearly fifty years old), which is usually cut down every year, the new fronds growing about

15 feet in length. *Asplenium macrophyllum* is a good basket Fern, but of slow growth. The hanging fronds are about 2 feet long. *Nephrolepis exaltata* is grown in a picturesque way, planted on a hollow stem about 2 feet high; the runners root down the side of this stem, and send out young plants. On reaching the surface of the soil these runners form a mass of young Ferns, the whole specimen being formed of a group of plants at different levels. *Peris serrulata major cristata*, 19 feet in circumference, has gracefully drooping fronds, which are 4 feet long. There are some curious varieties of *Polypodium*, *P. sanctum*, more like a *Cystopteris* than a *Polypody*; *P. falcatum*, from North America, resembles a very acute form of *P. vulgare*; it is still rare. *P. vulgare cornubiense* has *Davallia*-like fronds; and *P. vulgare glomeratum* is another curious form; *Lomaria fluviatilis cristata*, from New Zealand, has long narrow fronds; *Pellaea densa*, somewhat resembling a very finely-cut Parsley Fern, is nearly hardy; *Gymnogramma triangularis*, imported from North America, is like a miniature *Polypodium calcareum*; *G. schizophylla* has fronds so finely-cut as to be quite lace-like; the annual, *G. leptophylla* is doing well in the cool-house, in which many of the Filmy Ferns are grown; the fronds of *Hymenophyllum demissum* var. *nutans* are very finely cut, and amongst many other good kinds are *Adiantum sessilifolium*, *A. speciosum*, with gracefully arched fronds; *Lygodium flexuosum*, with much larger and thicker leaves than *L. scandens*; and *Davallia pycnocarpa*, a new Fern from Fiji, which resembles *D. pentaphylla*, but is more divided—Mr. Neill Fraser thinks it is possibly a variety of the latter.

No plants are more successfully grown here than Filmy Ferns; *Trichomanes*, and *Hymenophyllum* in great variety appear perfectly at home, some in heat but the greater number in a cool house, which only receives heat from the adjoining houses. Todeas sow themselves freely in this house, and in it the most beautiful specimen of *Trichomanes* in the whole collection is to be found a piece of tree-stem covered thickly all over its sides with the little fronds (of hair-like fineness) of *T. trichoidemum*, the whole specimen being about 13 foot high, and nearly as wide. On another piece of tree stem is *T. trichoidemum* growing on one side of it, and *T. pyxidiferum* on the other. *Hymenophyllum arizonicum*, from New Zealand, on a Tree Fern stem, is another specimen of Filmy Ferns grown as they are imported on stems—a plan which not only seems to suit these small kinds well, but also effectively shows their beauty. *Hymenophyllum asplenoides* on a stem, from Jamaica; *Trichomanes lucens*, also imported from Jamaica, probably the only plant in the country, and promising to be a very pretty Fern; *T. floribundum*, very rare, from Demara; *Hymenophyllum Malingii*, probably the only plant yet imported from New Zealand; *Trichomanes crispum*, like a transparent *Lomaria*, with the fructification well developed along the edges of the fronds, from Jamaica; and *Hymenophyllum dilatatum*, with long narrow fronds, are amongst the rarest kinds grown here. There is a fine plant of *Trichomanes reniforme*, and a specimen of *Hymenophyllum demissum* is about 3 feet across. There are but a few of the large variety of Ferns grown under glass. The collection of Ferns, native and exotic, out-of-doors, is very interesting; but, of course, it is too early in the season to see the plants fully developed. *Struthiopteris orientalis*, from Japan, has lived out-of-doors for the last six years. C. J. Owen.

THE DEVON ROSERY.

ALTHOUGH this extensive Rose-growing establishment is not perhaps so familiarly known to our readers as others that could be mentioned, it is not because it lacks interest as regards size, or that it is behind other leading establishments in the variety and quality of the stocks of Roses that are annually grown for sale, and that find their way in larger or smaller numbers to the remotest corners of the United Kingdom every season. But the Devon Rosery is more than its title would lead the majority of people to believe. It is, indeed, a well organised general nursery establishment, in which will be found excellent variety and superior quality of all the leading plants, trees, and shrubs of the day. Roses are, however, the "speciality," and it is no part of the writer's business to find fault with the title selected by the owners, Messrs. Curtis, Sandford & Co., who have been for many years successful prize-takers in the

* *Bomarea frondosa*, Mart., n. sp. nov. (Fig. 102, p. 669.)
Gleditsia edulis, lanceolata; acuminata; sommis compositis; foliis; cynis umbellatis simplicibus; multilobis; basi foliatis; pedunculo racemosis brevibus (1-2 pollicibus); floribus 2 poll. long. tubulosis; compositis dorsibus; perianthio segmentis; exterioribus angustis oblongis obtusis; lobis aurantiaco-lavatis; segmentis interioribus (quarta parte majoribus) flavis rubro-maculatis. L. fructibus apice tenui; medio lacinioso; acuminatis; basi compositis in unguem longissimum angustatis. Hab. Bogota. B. S. Under the name of *B. Caldasiana* supra descripta. Holton, Herb., n. 145, et Triana, n. 271, in herb. Kew.

leading classes for Roses at the principal exhibitions held in London and elsewhere. The Rosery is situated about a mile from Torquay, and less than five minutes' walk from Torre station. The entrance to the nursery is off the Paignton Road. A neat flower garden, already planted out, is laid out in front of the offices, near to which there is a span-house filled with Tea Roses in flower, and at the back of this house a lean-to structure is filled with white Arums, hybrid Perpetual Roses in flower, and a stock of the useful

south, with a path up the centre. Roses are trained against the back wall, and are planted out in the border along with two other rows trained bush fashion for supplying cut blooms. Addressing a question as regards kinds, one finds standard sorts well to the front in Devonshire as elsewhere. Niphetos first, Isabella Sprunt, Goubault, Madame Falcot, Marie Van Houthe, and Alba rosea, are foremost upon a very long list, which are all legibly named, so that he who runs may read. The stage in

season; and over 200,000 stocks are planted for working the present year. These numbers will give the reader an idea of the extent to which Rose growing is carried on. The next door is opened, and, lo! more Roses, but upon the roof this time—two giants, trained in opposite directions, in a cool-house, 120 feet long, and of considerable width. The sort is Marschal Niel, and the same house contains stocks of Gladiolus The Bride, coming into flower, young Myrtles, Marguerites, Solanums, Deutzias, Clematis,

FIG. 102.—BOMAREA FRONDEA: FLOWERS ORANGE AND YELLOW WITH RED SPOTS. (SEE P. 668.)

Scolopendrium Morganii, which is beautifully crested. The next house, a fernery, contains a healthy stock of Adiantums (of sorts), Neopteris nidus, Pteris, Gymnogrammas, and others, and a large span-roofed house is filled with Camellias and Azaleas—the latter a very healthy, saleable lot just starting into growth. A house attached to one side of the Camellia-house is filled with Pelargoniums, which have done good service through the winter and are now enjoying a partial rest. The long Rose-house, in two divisions of 60 feet each, is, however, the chief attraction for visitors at present. It is a lean-to house facing the

front is gay with seasonable plants in flower of Arums, Azaleas, decorative Pelargoniums, Lilies of the Valley (very fine), Auriculas, Mignonette, and hosts of other flowers, showy or fragrant.

But Roses form the theme of our discourse. "I cut over eighty blooms out of this small border," said my guide, and there were hundreds of others in bud, many of which would be cut during the next few hours. Climbing Devonensis is grown extensively, but in order to avoid vagueness I will quote statistics. Over 150,000 Roses in pots, dwarfs and standards, are, I was informed, grown in the Devon Rosery in a

and other useful plants. The plant stove and Azalea-house, both 70 feet long, and only divided by a glass partition, are filled respectively with excellent stock, the former with plants of Medicinilla magnifica, Clerodendrons, Crotons, Gardenias, Dracaenas in variety, Palms, all the favourite sorts, and Marantas, and the collection of Azaleas is also very fine. Then follows a house 100 feet long, filled with show Pelargoniums and bedding plants, and another of equal length stocked with Marschal Niel Roses in superb health worked on the Brier stock. This house is in two divisions, the warm end being filled with Orchids,

Amaryllis, a large stock of *Eucharis amazonica*, and other miscellaneous plants. The propagating house is in two divisions of 60 and 30 feet each, and in this department the usual briskness is observable—thousands of plants are either rooted or rooting, and Rose grafting is also being conducted by experts at the work.

In the outdoor department the stock is also in first-rate condition. The Roses are planted in double rows at about a foot apart, and 3 feet between the rows. This is not the usual way of planting, but it admits of horse labour taking the place of hand labour in scuffling between the rows, and of course the purchaser shares the advantage of cheap labour with the proprietors, whose great aim is to produce the best article at the cheapest price. When the plants are staked the stakes lean towards each other until their points meet about half way between the two rows of plants, thereby avoiding contact with the implement employed in scuffling between the rows. Acres of Roses are to be seen treated in this way at the present time in the most vigorous and healthy condition, and the display of bloom promises to be earlier and of greater excellence than usual. The soil is rather largely impregnated with red oxide of iron, which, strange as it may appear, exercises a healthy influence in producing bunches of fibrous roots, thereby securing almost complete immunity from loss in transit however far the distance. It is a well-known proverb that he who can make two blades of grass grow where only one grew before deserves well of his country, and may not the proverb be made applicable where Onions are found growing between the rows of fruit stocks, and Potatoes between the rows of Rose stocks, as is the case in the Devon Rosery? "We keep no vacant spaces here," said my *chaperon*; "we crop heavily and change our quarters frequently, so that the land is never worn out with the same kind of crop." And the evidence is indubitable that what is stated is a fact. Provision is also made for abundance of water over several acres of the nursery, standpipes being fixed at certain distances to ensure a liberal supply. The general nursery stock consists of choice Conifers, ornamental trees and shrubs in variety, fruit trees, herbaceous and alpine plants, florists' flowers and bedding plants, well grown, and embracing nearly every novelty of approved repute for the embellishment of gardens of all sizes during the summer and autumn months, *Devonian*.

ALPINE PLANTS.

THE GENTIANS.—From a horticultural point of view we may distinguish two classes of Gentians—1, the large-growing species, which may be cultivated in the open border, and the stout roots of which are too much restricted in the narrow space afforded by our rockeries; 2, the smaller species, the fine and numerous roots of which are specially adapted to "alpine" cultivation. In the first series may be placed *G. lutea*, *purpurea*, *punctata*, *Charpentieri*, *Thomasi*, and *Gaudiniana*, as well as the two marsh-growing species, *G. asclepiadea* and *pneumonanthe*. The second series includes *G. verna*, *bavariae*, *brachyphylla*, *acutis*, *alpina*, *pyrenaica*, *ciliata*, and some allied species.

G. lutea, *L.*, is the most widely spread species of the genus. It is met with in all the mountain regions of Europe. In Switzerland it grows in alpine pastures at a height of 1000–2000 metres, but is often found at a lower elevation. This plant belongs specially to the mountain region, of the vegetation of which it forms one of the principal characteristics. Its tall habit and its bold broad leaves are very ornamental. This *Gentian*, the *Veratrum* and the *Rumex*, have the finest foliage of all our Swiss plants. *G. lutea* is almost always found in company with *Veratrum album*, the habit and the leaves of which are very like those of the *Gentian*, so that they are often confounded when not in flower, unless they are closely examined. *G. lutea* grows to a considerable height. I have seen specimens measuring 1.50 metres (4½ to 5 feet) in rich pastures. The numerous yellow flowers, arranged in cælebrum fashion, are unique in the genus. The cattle refuse its foliage and leave untouched the noble inflorescence, but on the other hand the shepherds and the natives make war upon it and dig up the enormous roots for distilling purposes and the formation of a liqueur. Such distilleries occur in all our

mountains, and this liqueur, which is useful to those who know how to partake of it in moderation, is a perfect cure to others of our mountain population, who cannot use it in moderation. The plant then is in process of extirpation, and if this be not checked it will become very rare.

G. lutea is easily cultivated. It is planted on grass in well drained soil, rich in humus. If it is wished to cultivate it on a rockery it must have a corner to itself where the soil is so deep as to admit of its deeply penetrating roots. Transplantation is not successful unless in the case of young plants. I have succeeded in propagating it by seed, but it requires five or six years before it will flower. *G. lutea* is in bloom from July to September.

G. purpurea, *L.*, has some resemblance as to foliage to the preceding, but differs in habit and flower. It is met with in the lofty pasture, and is very pretty and interesting. It flowers so late in the season as to be the last decoration of our mountains. This plant never attains a great height, and its flower-stem is provided with numerous thickly-set large flowers of the deepest purple. It is met with especially in moist places and on soils rich in humus. Its cultivation is the same as that appropriate to the four following species, and may be briefly summed up as follows:—

Soil peaty or of decayed leaves, aspect rather shady and moist, flat surface, or if it be desired to grow it on a rockery a deep pocket is required for it, as for *G. lutea*, but carefully drained, so that the water may readily get away. In the case of transplanted specimens, and which should be young and with all their roots, they must be cultivated in pots for a time, so as to allow them to become established and be more easily managed. Good plants are obtained from seed, but in order that the seed shall be well ripened it must be gathered late in the year—as late as October even.

G. punctata, *L.*, is a very pretty and remarkable species. Its yellow corolla is sprinkled with small reddish-purple spots, and in habit it is intermediate between *G. lutea* and *G. purpurea*. It is found especially in the Bernese Alps and in the higher Alps of the Valais.

G. Thomasi, *Gill*; *G. Charpentieri*, *Thom.*; *G. Gaudiniana*, *Thom.*, are three forms of hybrid origin; nevertheless, by reason of their very marked characteristics, some botanists consider them as species. They are rarely met with, and indeed are nearly confined to the mountain districts of Western Switzerland, as on the Dent du Morcle, the Croix de Taverne, and the grassy slopes of Anzeindaz.

G. cruciata, *L.*, is a very pretty species, with flowers arranged crosswise, in large heads, and of a celestial blue. It is found on all our limestone mountains and is common on the Jura range. This species does not belong to the higher alpine region, but to the lower mountain districts, and may sometimes even be met with in the plains. It is thus that in the plateaux and meadows which encircle the base of the Jura, *G. cruciata* occurs in admixture with the members of the Swiss flora, and bears the brilliancy of an almost Italian sun. Its foliage is handsome and bright, and it has the advantage of flowering late in the year, the roots being smaller than in the previously mentioned species, it may be more readily cultivated on the rockery, but the pocket must be large and well-drained. If a clump of it is grown in such a situation, the effect will be better than if grown as isolated specimens. I have seen it make a good appearance when used for edgings in the open ground. For this purpose it must be grown in a sunny situation, and in a rich limestone soil.

G. pneumonanthe, *L.*, is a very beautiful species, which is a marsh or bog plant. It grows on the plains and is not met with on the mountains. Its elegant habit, its deep green shining leaves and its large flowers, arranged in heads, are of the finest blue. They have precisely the colour and form of the flowers of *G. acutis*, but are smaller and arranged in groups of five or six. The height of the plant varies according to the soil. I have met with some which did not exceed 15–20 cm. in height, while others on the banks of streamlets attained a height of a metre. This fine species is met with in the marshy districts of Yverdon (Vaud), and generally speaking in all the marshes at the base of the Jura; and may (although not usually met with on the mountains) be seen near St. Croix, a village surrounded by peat bogs and at an elevation of 1000 metres above the sea. I grow this fine species in good leaf-mould mixed with sphagnum and sand in damp places, but fully exposed to the sun. On a rockery it should be grown in a deep pocket and plentifully supplied with water.

G. asclepiadea, *L.*, resembles the preceding, but is more alpine in its locality, and is only rarely met with in the plains; it is, nevertheless, a bog plant, but which occurs especially on the mountain sides. It is true that in the canton of Zurich, and generally in the lower Alps, it descends to the base of the mountains. It is met with thus all along the Albis-mountains. It descends even to the marshy grounds of the "petits cantons." Its habit differs from that of *G. pneumonanthe* in that its stems are taller, provided with broad, clear green leaves, while the flowers are arranged all along the stem in the axis of the leaves. It forms then long spikes of blue flowers, larger than those of *G. pneumonanthe*, but of a less bright colour. There is a white variety. This plant, which has been introduced among our herbaceous plants in gardens, requires no special care, and succeeds very well in the open border. Nevertheless, to cultivate it well it should be grown in peat, or on porous soil kept moist. Its immense roots afford an obstacle to its transplantation from the mountains, but if quite young plants be chosen success will ensue. This plant grows generally on the margins of woods, or in coppices, never fully exposed to the sun, but always where there is much moisture—conditions easily imitated in cultivation. I have seen in the woods which are near the Plan de Fremire above Bex, at 1068 metres elevation, plants of this species, the stems of which were more than a yard in height, and which were covered with flowers in their upper portion, producing a beautiful effect. *H. Correvon, Botanic Garden, Geneva.*

(To be continued.)

MANURES AS ABSORBENTS OF WATER.

BY A. STEPHEN WILSON.

(Continued from p. 641.)

FOURTH SERIES.

THE fourth series of comparisons consisted of some of the same manures as were used in the third series. They were taken from the same dried heaps, but put into cups of a different form, the intention being to have confirmation of results under various circumstances. The cups were placed in the same floor upon a board, so as to avoid adhesive moisture. Only a few of the weightings are recorded in the subjoined table.

1881.	I.		II.		III.		IV.

In this experiment the cups were deeper and had less surface than in the previous case, but the order of absorptive power is nearly the same as before. The period of exposure was the same as in the third series, but the Potato manure—the most powerfully absorptive of the set—has here only taken up 59 per cent., while in the previous case it took up 92 per cent. Probably the difference is to be explained partly by the difference in area of surface exposed; but there are evidently other considerations involved, because in this case the deeper cup of cow-dung with less surface has the higher weight of absorbed moisture, namely, 19 as against 16. I shall not at present attempt to explain this difficulty, as it in no way affects the main contention.

FIFTH SERIES.

THE fifth series of comparisons was also with some of the same manures as above, dried in the same way, but tested in another form of cups, and in the same place as the others. Only a sufficient number of weightings are given to show the comparative rate of absorption:—

1881.	I.		II.		III.		IV.		V.

Here the coprolite dissolved with sulphuric acid absorbs four times as much water as the same coprolite merely ground to a fine flour. In the third series the dissolved phosphate took up five times as much as the ground phosphate. The difference no doubt arises from causes acting in relation to difference of surface exposed; but that the superphosphate absorbs a large amount of moisture more than the ground phosphate is clear. It is clear also that the guano, as compared with the soil and the ground phosphate, has a high hygroscopic power.

DEDUCTIONS.

No new property in any of the substances here experimented with is assumed to be discovered; but only some of the well known properties assumed to be set perhaps in a new light. Into the composition of guano, superphosphate, and the various Turnip and Potato manures, enter large quantities of various salts of a highly deliquescent character—that is, salts which are highly hygroscopic. The large percentages of sulphate of potash and ammonia in Potato and Turnip manures, explain why, in the above experiments, these manures absorb such large quantities of moisture. A comparison of the composition of the superphosphates with the undissolved materials of which they are formed, also explains why these materials, after being treated with sulphuric acid, became more absorptive of moisture.

Now if in a dry season part of a Turnip crop, for example, is laid down with a hygroscopic manure and part with a non-hygroscopic, the plants in the first case will be better supplied with water than in the second case.

HOW ROOTS GET WATER.

But how do the roots of plants get water? In plants which grow in water in its liquid form, the roots are directly in contact with water, and the matter seems plain. But with plants which grow in drained land, where there is no water in a liquid form, the aspect of things is different.

I filled pots of clear glass with small stones and loose open soil up to near the brim and finished with a thin layer of good soil. Seeds of Oats, Wheat, and Barley were then planted close round the edge, so that their roots would come down near the clear glass through and amongst the openings made by the small stones and lumpy soil. Whenever a fresh growing root appeared in an available position, a low power objective was directed upon it, and it was found that the root-hairs were covered with innumerable vesicles of moisture. I therefore concluded that in dry soils the roots of plants do not go in search of water—the water comes in search of them. The water which they need is condensed upon their root-hairs, and thence absorbed into the tissue.

Now a manure which has a highly hygroscopic capacity will keep the soil around the roots of plants better charged with moisture than a manure of the opposite character; evaporation will fill the interspaces of the soil with vapour, and will thus enable the moisture withdrawn from the air to be condensed on the roots. Whether any part of the food of a plant may be condensed in solution upon the root-hairs in addition to mere water may be a question. "Liebig has suggested," say Johnston and Cameron, "that plants do not take up their food in solution, seeing that it is so sparingly soluble in the liquid present in the soil. It seems, however, improbable," they add, "that solid matters could pass into the organisms of plants, and we can hardly accept Liebig's theory, at least in its entirety, until our knowledge of the physical condition in which the food of plants exists in the soil is considerably enlarged" (pp. 229, 230, 11th ed.). The "solution" implied by Liebig was solution in liquid water. But if any part of plant food—ammonia, for example—may be vapourised and condensed within the vesicles on the roots, a different view is opened up.

Certain manures are characterised by giving a rapid growth to plants in the early part of the season. Two main causes combine to render hygroscopic manures rapid in their action; they are soluble, and they have the capacity of absorbing the moisture which renders them fluid, thus distributing their particles and rendering them highly available by the roots.

HYGROSORPTION IN RELATION TO FUNGI.

But other incidental consequences will arise from the hygroscopic action of a manure. From certain

experiments made by Mr. Thomas Jamieson, he has discovered that manures treated with sulphuric acid have a greater tendency to foster the development of club-root in Turnips than manures not so treated. His explanation is that the sulphur in the manure and in the Turnip is the predisposing cause of clubbing (see Report Aberdeen Agr. Assoc. 1880). This explanation does not seem to me to meet the requirements of the case. M. Woronin has clearly shown that the cause of clubbing in the roots of Brassicaceous plants is the simple spore-bearing parasitic fungus which he names *Plasmodiophora brassicæ*. His main conclusions have been all verified by the present writer. Now the spores of this fungus, which are minute hyaline spheres, lie quiescent through the winter. In the early summer, if they are supplied with moisture, they give off zoospores, which very soon "plasmodiate" or become fused together into a homogeneous, semi-liquid mass. A manure, therefore, of a hygroscopic character, is just the very manure to promote the plasmodiation of these spores, and render them fit to be absorbed in the form of a fluid plasm by the roots of the plants. We do not directly know that sulphur promotes the germination of this fungus, but we do know that the moisture accompanying a manure dissolved by sulphuric acid is a *vera causa* in promoting the germination of the spores of this fungus; in other words, the application of moisture to a spore previously kept dry is directly seen to cause it either to give birth to a zoospore or to plasmodiate retaining its contents—both results being essentially the same, and giving rise to a speck of granular plasm. But upon this view any manure of a highly hygroscopic character, whether containing sulphur or not, should be found promoting club-root. This, accordingly, is known to be the case. Land manured with sea-weeds, the salts forming which are highly absorptive of moisture, has had to be disused as a Turnip soil—owing to the prevalence of clubbing. But, indeed, all the manures here tested are more or less hygroscopic as compared with soil; and all manures are occasionally found associated with clubbing. The enormous clubbing of the Cabbage roots in the market gardens around St. Petersburg, referred to by M. Woronin, was not caused by the use of superphosphate. And the first recorded prevalence of this disease is found by that botanist in the writings of a Spanish king of a date earlier than the invention of dissolving manures with vitriol. Besides this fungus attacks the stock Gilliflower, and other plants which never receive dissolved manures. In cornfields where no superphosphate has been applied the Charlock is in many cases found to be clubbed. And the fact that clubbing in Turnips goes along with superphosphate, or along with manures containing deliquescent salts, finds its natural explanation as a corollary of the theory of hygroscopicity. The manures do not cause the club-root fungus any more than they cause the plants in which it grows—they simply promote the growth of both; and the more rapidly the host-plant grows, or multiplies its cells, the further through its tissues will the plasm of the parasite be carried.

The Potato manure in the above tables contains a high percentage of potash, and is the most hygroscopic of the set. There can be no doubt, therefore, that the growth of the non-parasitic system of the *Peronospora infestans*, or Potato fungus, will be promoted by such hygroscopic manures. The parasitic system of this fungus, as it exists in the Potato leaf, grows mostly during the night, when plenty of moisture is available; and the non-parasitic mycelium, arising from conidia and resting spores within the soil, can only grow and extend its lines when surrounded by a moist medium.

The manures here experimented with only began to promote the germination of certain moulds after the salts had been so far diluted by the water they absorbed as to be harmless to the fungi; for it is obvious that strong sulphuric or other acid would be destructive to all vegetable life. But if manures are favourable to the growth of phenogamous plants, all the more likely is it that they will be favourable to the growth of cryptogamous plants. Indeed hardly a speck of decomposing or rotting matter, in other words manure, can be found free of certain parts of some non-parasitic fungus. And if manures, which are simply plant-food, are thus favourable to non-parasitic fungi of all kinds, they must be favourable to the non-parasitic elements of those fungi which attain their perfect or fruit-bearing condition as parasites in the tissues of phenogamous plants. And that

the hygroscopic action of manures should favour the growth of certain Cryptogams is no more to be wondered at than that the same action should favour the growth of certain Phenogams.

But these effects on fungi are rather to be regarded here as incidental. The direct value of hygroscopicity in a manure is the supply which it draws of moisture from the air for the roots of plants. The manure requires to be so nearly in a liquid form, as that it may find its way osmotically through the cell-walls of the roots, and it has the property of being able to absorb from the air the very moisture required to liquify it. The process is still further accelerated by the condensation of vesicles of moisture upon the young and growing fibres of the roots. It is not water in the liquid form which agricultural plants require, but water in the form of condensable vapour, and this is what is partly supplied to them by the hygroscopicity of manures.

In their ordinary market condition these manures usually contain from 12 to 15 per cent. of moisture. But we see that they can add largely to this amount when exposed to the atmosphere. And the more powerfully a manure abstracts moisture from the air the more powerfully will it resist drying or the giving of it up again. During the night moisture will be drawn from the air, and during the day a part of this moisture, vapourised within the soil from the dead material of the manure, will be condensed upon the living roots and root-hairs in the form of minute dew-drops to water the plants. Farmyard manure, which keeps the soil open, has a mechanical value in creating air-chambers, from which vapour may be condensed upon the roots passing through them, succeeded by a chemical value consequent upon complete decomposition.

By what cause moisture is thus condensed upon the root-hairs is doubtful. My own experiments with masses of the young roots of Cress and Turnip growing through little wire baskets under a water-closed glass bell, and having a delicate thermometer which keeps the soil open, has a mechanical value in creating decided indication that the roots were colder or warmer than the surrounding air. Other trials made within the soil were not satisfactory. The matter deserves further investigation, and will probably bring into view some new facts regarding the relationship of plants and their food; and also some new facts in explanation of the theory of drainage.

MISS NORTH'S CRINUMS.

AMONGST the paintings in Miss North's beautiful collection, already hung in the new gallery which she has built in Kew Gardens and shortly to be opened to the public, are two Crinum from Borneo. One of them is the *Crinum angustum* of Roxburgh, which is perhaps the finest for decorative purposes of all the known species. This is already well known to botanists, and as I described it fully in the monograph which I contributed to your columns a year ago, I need not say anything further about it now. But the other species, which hangs over the doorway in the south-east corner of the gallery and is numbered 424, is quite distinct from any of those noticed in my paper, and I draw attention to it now in the hope and expectation that, as in the case of the Nepenthes, it will be looked after and brought into cultivation. The following is as full a description of it as I am able to give from the painting. The plant grows in water, and Miss North speaks of it as being plentiful in the locality, which is in the vicinity of Sarawak, and therefore easy of access. It belongs to the *Platyaster* section, but differs from all the known species (*erubescens*, *americanum*, *ameum*, *longifolium*, *Balfourii*, &c.) by its large asiaticum-like leaves, stout scape, and dense many-flowered umbel. In fact, in general terms it may be described as being a species with an asiaticum-like habit, but with the lanceolate perianth-segments of the *Platyaster* section.

CRINUM NORTHIANUM, n. sp.—Leaves large, lorate, bright green, erect, overtopping the umbel, apparently 3 or 4 feet long, and 3 or 4 inches broad. Scape stout, tall, probably 1 inch in thickness. Flowers thirty or forty in a dense, centripetal umbel; spathe-valves deltoid, 3–4 inches long. Perianth-tube greenish, as long as the segments; segments lanceolate, pure white, narrowed gradually from the middle to the acute point, 3–4 inches long, $\frac{1}{2}$ inch broad, spreading stately horizontally and equally. Filaments bright red, about 1 inch shorter than the perianth-segments; anthers linear. Style arcuate, bright red, about as long as the filaments.—Sarawak, Borneo. Miss North's drawings, 424, *f. G. Baker*.

NEW GARDEN FERNS.

ELAPHOGLOSSUM BACKHOUSIANUM, *sp. n.* (fig. 104).

Caudex stout, slowly creeping, densely covered with pale brown lanceolate scales. Sterile fronds large, crowded, erect, smooth, oblong-lanceolate, broadest upwards, the apex acute, the base narrowed acute or rounded, the costa rounded and prominent behind, where it is densely scaly, the margin decorated with a fringe of dark brown criniform scales; veins free, simple or forked near the base, parallel, extending at an obtuse angle towards the margin, and ending in a thickened point just within the edge, the stipes short, stout, densely scaly. Fertile fronds much smaller, narrow lanceolate, broadest upwards, entire, attenuate both at the apex and decurrent base, "thickly sprinkled with deciduous dark scaly hairs," the spore-cases covering the whole of the under surface, the stipes twice as long as in the sterile fronds, the scales of the stipes and costae very dark brown, criniform, affixed by a short broad base, resembling those which border the sterile frond.—Habitat, Mexico. Introduced by Messrs. J. Backhouse & Son, York, amongst an importation of epiphytal Orchids.

This noble species of Elephant's-tongue Fern, which was sent to us a short time since by Messrs. James Backhouse & Son, of the York Nurseries, appears to have been hitherto undescribed, and we have therefore much pleasure in connecting with it the name of Mr. James Backhouse, who, in the annals of pteridology, is not unknown to fame in connection with the discovery of some of the rarer British species. As a temperate stove Fern it will be welcomed by growers of these plants for its bold character, and for the very interesting fringe of peculiarly shaped dark-coloured ornamental scales which decorate the margins of the sterile fronds, and which are similar in form and colour to those that give a densely shaggy appearance to the short thick stipes, and to those also which, as Mr. Backhouse informs us, are thickly scattered over both surfaces of the fertile fronds like the hair-scales so familiar in *Hymenodium crinitum*. It is most nearly allied to the Brazilian *Elaphoglossum Prestonii* (*Acrostichum*, Baker), described in the *Gardener's Chronicle* for 1872 (p. 1555), but that has smaller long-stalked fronds, and differs greatly in the form of the scales with which its stipes and the margins of its fronds are invested.

Elaphoglossum Backhousianum, the subject of our present notice, has a decumbent slowly creeping caudex, as thick or thicker than one's thumb, which is densely clothed with pale brown lanceolate-subulate scales (fig. 103). From this caudex spring up at short intervals the erect subcoriaceous fronds, which grow from 1½ to 2 feet or somewhat more in length, including the thick densely scaly stipes of little over an inch long; the lamina is sometimes acute, sometimes rounded at the base, about an inch in width at or near the lower extremity, gradually widening upwards, so that at from 4 to 6 inches below the apex it measures 3 to 4 inches or more across, whence it gradually narrows and curves off to form the acute point, the margin being somewhat wavy. Thus, the upper half of the frond is conspicuously wider than the lower portion. The colour is a bright green, which shows off the fringe of dark brown scales which occupies the margin (fig. 105, A). These scales are of peculiar form (fig. 105, B), having a short broadly-ovate base and a much extended criniform apex several times longer than the base; the back of the costa is furnished with numerous scales of a similar character (fig. 105, C), as also is the stipes (fig. 105, D), but the former are deciduous and soon lost, while the latter appear to be more permanent.

The fertile fronds (fig. 105, E, F) are much smaller than the barren ones, not exceeding a foot in length, including a stipes of 2 inches, and a narrowly decurrent base of about the same length, while the width does not exceed an inch at the broadest part above the middle, whence it narrows gradually upwards to a longish attenuate apex, and downwards to the decurrent base already mentioned. The upper surface (fig. 105, F) is smooth and green, and the under surface (fig. 105, E) densely covered throughout, including the decurrent base, with light brown spore-cases, forming the usual universal acrostichoid fructification (fig. 105, G). According to Mr. Backhouse's observation, these fertile fronds are thickly furnished on both surfaces with dark chatthy scaly hairs, such as occur on the fronds of *Hymenodium crinitum*, but these appear to be soon deciduous, and do not occur except on the costa in the specimens which have reached us, The

margin is slightly repand, but otherwise entire, and is without the scaly fringe which appears on the sterile fronds. *T. Moore.*

DAVALLIA GRIFFITHIANA, *Hook., Sp. Fil., i., 168, t. 49 D; Hook. and Baker, Syn. Fil. 96.*

Fronds deltoid with an attenuate apex, coriaceous,

been met with in other parts of Northern India and in China. It may be regarded as an evergreen greenhouse plant, though how low a temperature may be compatible with its healthy growth we have no information. Perhaps Mr. Howard will state his experience on this point.

FIG. 103.—ROOT-STOCK OF ELAPHOGLOSSUM BACKHOUSIANUM.

tripinnate; pinnae acuminate; pinnettes oblong-lanceolate, obtuse, obliquely cuneate at the base, the basal ones again pinnate, the rest pinnatifid; lobes short, obtuse; sori large, cup-shaped, submarginal, usually with a marginal tooth projecting beyond them; indusium flat, membranaceous; rhizomes extensively creeping, as thick as one's little finger, densely clothed with whitish fibrillate linear scales; stipes erect, wiry, elongated.

This Fern is very remarkable for the silvery scales with which its rhizomes are covered, and as these grow freely and extend to a considerable length they soon make themselves seen hanging from the surface of the pot or basket in which the plant is grown. The fronds are thick and durable, elegantly shaped and elegantly cut, of a dark bluish shade of green, and of moderate size, 9–12 inches in length, and

FIG. 104.—ELAPHOGLOSSUM BACKHOUSIANUM: SHOWING HABIT: REDUCED.

This elegant Fern was shown at the last meeting at South Kensington by Mr. Howard, of Southgate, and received a well-merited First-class Certificate as a desirable species for basket culture and other decorative uses.

It was originally found in Assam by the late Dr. Griffith, after whom it is named, but has since

4–8 inches in breadth, so that they never verge upon coarseness; while the abundant fructification and the paler under-surface of the frond, as seen in the various positions in which the plants and fronds are placed, add much to their interest.

We understand from Mr. Howard that his plants were picked out of an importation of Orchids—a way

in which many other Ferns have found their way to this country. As a free-growing and ornamental Hare's-foot Fern this species will, no doubt, soon become popular in collections where decorative plants are grown and appreciated. *T. Moore.*

countless number of ramifications, so that the plant forms a little green ball, studded over the whole upper surface with points innumerable, and very much resembles in its subdivision a branch of the leaf of an extra fine curled Parsley. The comparison

cushions of green velvet, and the effect produced by the tiny tufts of this curious Fern will be realised. As a variety amongst the British Ferns this is, for pteridologists, a gem of gems.

Surely the force of variation can no further go—no flat lengthened leaf-blade produced, but an indefinitely branched dense glomerate ball, bristling with little herbaceous points, so fine that the surface suggests the velvety texture of the mass. The change is marvellous, the result startling, bewildering, making sport of nice botanical definitions and distinctions—as Nature is apt to do.

The variety *densum*, as we learn from Messrs. Kelway & Son, of Langport, by whom it was raised, originated as a sport from, we presume, the variety *Kelwayi*, itself a crested form. It was shown by them at South Kensington on the 9th inst., the dozen plants which were staged affording good evidence of its constancy of character. On this occasion the Floral Committee unanimously awarded it a First-class Certificate, as a most interesting addition to a particular group of plants, which, if not bold and startling enough to suit all tastes, counts at least many admirers amongst those who appreciate the minute types of beauty to be found amongst the productions of Nature. *T. Moore.*

ASPLENUM (DIPLAZIUM) LAFFANIANUM, *Baker, n. sp.**

This is a Bermuda Fern, which we have had *sub judice* at Kew for a great many years, and looked on as a probable new species. A dried specimen was sent to us in 1874 by Lieut.-General Sir J. H. Lefroy, who at that time was the Governor of the islands, and took great pains to work out the botany and all other points of interest connected with the group, on which he has, since his return home, published a valuable monograph. Although the plant seemed to be distinct, I durst not venture to found a new species on the material obtained. In 1880 we received a pinna from Professor Eaton, gathered by Mr. Anson Allen, and the same year a living plant from Major-General Sir Robert Laffan, who succeeded Lieutenant-General Lefroy as Governor in 1877. This has now grown up to the fruiting stage, and I think there can be no room for doubt that the plant is really a distinct endemic species, allied to the well-known West Indian *A. crenulatum* and *Franconis*, coming in between them in character, and also to *A. diminitum*, a new species recently discovered by Mr. G. S. Jenman in Jamaica, and the Andine *A. Mildei* of Kuhn.

Caudex erect, rising in a short column above the surface of the soil, crowned by eight or ten fronds. Paleæ confined to the caudex and base of the stipes, lanceolate, dull brown, firm in texture, the largest $\frac{1}{2}$ —1 inch long, stipes 4—8 inches long, blackish and scaly towards the base, green above it, and quite naked, as is the rachis. Lamina oblong, deltoid, bipinnate, moderately firm in texture, bright green, and quite free from hairs or scales on both surfaces, attaining a foot in length and half a foot in breadth. Pinnae lanceolate, nearly sessile, imbricate, the lowest the largest about $1\frac{1}{2}$ inch broad, the central ones 7 —1 inch broad. Pinnules oblong, obtuse, serrate, unequal-sided (produced on the upper side, cut away on the lower side at the base), the upper ones broadly adnate to the rachis, the lowest free but sessile and shallowly pinnatifid, with short, rounded lobes; veins free, distinct, the upper ones of the pinnules forked, those of the lower groups pinnate, with 5—9 erecto-patent veinlets. Sori medial, running nearly from the costa to the tip of the veins, mostly simple, but the lowest diplozoid $\frac{1}{2}$ —1 inch long. Involucre glabrous, persistent. *J. G. Baker.*

LEIOPHYLLUM BUXIFOLIUM is one of the most ornamental of dwarf evergreen shrubs. At the present time its foliage is almost completely hidden by the terminal umbel-like clusters of small white flowers, which when in bud present such a pretty pink or rosy tint. It is the Sand Myrtle of the sandy Pine barrens of New Jersey, and, according to London, was introduced to this country in 1736. In nurseries it is generally found under the name of *Lesium thymifolium* or *L. buxifolium*. It flourishes thoroughly in any ordinary peat border, and remains a considerable time in bloom.

* *Asplenium (Diplazium) Laffanianum*, Baker, n. sp.—Caudex erecto, paleæ lanceolatis, sordid brunneis, stipulis semirepandibus supra basin nudis; frondibus oblongo-deltoidibus bipinnatis glabris viridibus pediculis, pinna lanceolatis imbricatis, subsessilibus infimis maximis, pinnulis oblongis serratis obtusis basi posteriori cuneato truncatis superioribus adnatis infimis sessilibus obscure pinnatifidis, venis pinnularum supero-ribus furcatis inferioribus pinnatis; soriis medialibus tubosis geminis; involucre glabro persistente.

FIG. 105.—ELAPHOGLOSSUM BACKHOUSIANUM. (FOR DETAILS SEE TEXT.)

SCOLEPENDRIUM VULGARE DENSUM, *Kelway.*
In this remarkable variety of Hart's-tongue Fern the typical plane strap-shaped frond, a foot or more in length, is reduced in stature to about 3 inches, and amplified laterally by becoming branched into a

is not intended to be depreciatory, but flattering, for what is more pleasing in its way than the foliage of a really good strain of Parsley, with its countless and complicated contortions, and its rich full green colour? Compare the pigmy plants, if you will, with little

Orchid Notes and Cleanings.

WORK IN THE HOUSES.—During the next two months the Orchid-houses will be more interesting than at any other season, as the great number of species and varieties that flower during the early summer months will keep the houses gay for some time. It is a trying season for plants that are flowering profusely unless they are very well rooted, as a large crop of flowers, if allowed to remain too long on the plants, will soon throw them into a debilitated condition. The first sign of exhaustion will be seen in the shrivelling of the bulbs, and when this occurs the sooner the plants are divested of their flower-spikes the better. All plants growing on blocks will now require frequent attention to keep them regularly moist at the roots. It adds much to the labour in attending to a collection of these plants where many of them are grown on blocks, and for this reason the system is fast dying out, as with few exceptions the plants will do equally well, or better, in baskets and cylinders. One exception is *Dendrobium pulchellum*. This we have never seen in such good condition as when grown on a round block, and the present is a good time to establish this plant on a block, as it is just past the flowering stage, and will shortly commence new growths, which must be encouraged in a warm moist atmosphere. After the growths are made up the plants must have a long season of rest in a cooler temperature, and in spring, when the flowers expand, it will be a perfect ball of blossom. The *Cyclogynis* will now be growing freely, and should be kept well watered. The same remarks apply to the *Pleiones*, but the latter need not be so heavily shaded as the *Cyclogynis*. *Chysis bracteosa* should be resurfaced as soon as it has finished flowering; and as the flowers and the young growths come together, the latter must be encouraged in a warm moist atmosphere as soon as the flowers are removed from them. Another distinct and pretty Orchid, now in right condition for potting, is *Eriopsis rutidobulbon*. It should be potted in rough fibrous peat, and should not at any time be allowed to become dry at the root. It generally flowers twice a year, and grows well in a cool part of the Cattleya-house. *Oncidium Marshallii*, one of the finest of the genus, may now be resurfaced and put in order before the young growths are far advanced. A cylinder is a more suitable receptacle in which to grow this plant than a pot. *Oncidium incurvum* and *O. ornithorhynchum* will now be pushing up their fragile spikes, and should be carefully guarded from damage. Most of the *Trichoplias* will now be over, and if any need potting the sooner they are seen to the better. These all do well in rough fibrous peat, with good drainage, and the temperature of the Cattleya-house will suit their requirements. It will be necessary to give the East India-house a fumigation occasionally to keep the thrips and other insect pests in check, for if these are allowed to gain a footing on the plants they soon disfigure them for the season. Any of the *Acerides* that are flowering should have their spikes removed before the flowers commence to fade and drop, as, owing to their sticky nature, if they are allowed to drop into the axils, or to remain long on the leaves of the plants, they are very likely to cause decay in the plants; but these should always be carefully sponged over after flowering. *J. Roberts, Cammersbury.*

CHATEAU DE ST. GILLES, near Liège, is prettily situated among the hills above this picturesque city, and is the summer residence of Mons. F. Massange de Louvrex. Orchids are grown here in large quantities, as well as new stove and greenhouse plants, Bromeliaceous plants, &c. In the cool Orchid-house were recently some fine well-grown specimens of *Odonotoglossum*, *Masdevallias*, &c., flowering freely; there was, at the time of our visit, a fine variety of *M. ignea* in flower, called *Masanganana*, as also *M. trochilus*, with several flowers, and *M. amabilis*, with a profusion of flowers. Amongst the *Odonotoglossum*, *O. Andersonianum* was in fine form, and the rare *O. polyanthum* and many others in bud. The new *Masdevallia rosea* was also showing flower. In the East India-house were some fine examples of *Cypripediums* and *Vandas*, well cultivated. Passing to the Cattleya-house we observed some fine examples of *C. Warneri*, *C. Mossie*, *C. speciosissima*, and a grand plant of *Lælia elegans*; these, as were all the

Cattleyas, were in good health, and showing sheaths. In the stove were some fine examples of new plants, some of the specimens of which took the leading prizes at the exhibition at Liège last year. I noticed a grand example of *Platyterium grande*, one of the finest specimens I have ever seen. The whole of the plants here are well cultivated, and great credit is due to M. Karl Kramer, the gardener, for the way in which he grows the plants, backed up as he is by his employer, who spares no expense to have the best of everything. *H. Williams, Holloway.*

ORCHIDS IN FLOWER AT TREDREA, CORNWALL.—There is now at this place a grand display of these attractive flowers, which to any lover of Orchids will amply repay a visit. There is here at all times much to interest an Orchid grower, as former visits can testify. Mr. Merton (the gardener) has long been known as a veteran in this department, and well he maintains his position, as proved by the health of his plants. There are now in flower many specimens (over sixty) that would delight the eye of a connoisseur. *Oncidium applanatum majus*, with a dozen spikes, and in rude health, is a most telling specimen; while *Lycaste cruenta* is another golden mass, with fragrance sufficient for a large house. *Lycaste Deppel* is another most interesting plant, but the grandest plant in the whole collection, now in flower, is *Dendrobium Falconeri*—this of itself is worth a long journey to see. Mr. Merton has evidently found out the right treatment for this gem of a *Dendro*, which many find so difficult to flower, but when seen as here amply repays any care that may be bestowed on it. *Masdevallia Hartmanni* catches the eye, and is a most excellent variety of these peculiar flowers. There are also in flower *Acerides vitens*, *Anguloa Closwey*, very fine; *Brassavola glauca*, *Brassia Lawrenceana*, *Burlingtonia fragrans*, *Calanthe veratrifolia*, *Cattleya citrina*, *C. Mossie* (two), *C. maxima*, *C. Skinneri*, *C. Warneri* (two); *Cypripedium barbatum*, *C. barbatum nigrum*, *hisutissimum*, *Lawrenceanum*, *niveum* (three plants), and *Pearecei*; *Dendrobium Bensonae*, *D. chrysotoxum*, *D. Devonianum*, *D. eburneum*, *D. Parishii* (three varieties), *D. infundibulatum*, *D. suavisimum*, *D. thyrsoiflorum*; *Epistedium macrochilum*, *E. Stamfordianum*, *E. elongatum*, *E. rhizophorum* (several), *E. vitellinum majus* (several); *Lælia majalis*, *Lycaste aromatica*, *Maxillaria tenuifolia*, *Odonotoglossum crispum*, *O. citrosomum*, *O. maculatum*, *O. vexillarium* (fine plant), *O. Koezii* (grand variety); *Oncidium aurosum*, *O. phymatochilum*; *Phalænopsis Parishii*, *P. Luddemanniana*, *P. Schilleriana*; *Phaius Wallichii*, *Scaccolabium ampullaceum*, *S. curviflorum*; *Sobralia macrantha*, *Trichoplia tortilis*, and *Vanda savais*. *R. G.*

TULIPS IN LANCASHIRE.

WHATEVER may be the character of the malady that at times affects so seriously the collections of show Tulips, it does not appear to originate from merely local causes, as the same phenomena appear alike in Lancashire, Derbyshire, Staffordshire, and Yorkshire. At Stakehill, near Manchester, Mr. S. Barlow's beds are this season grievously affected by it; the bloom of a great many of the finer varieties is lost for this season, and it may be for a year or two afterwards, while the very existence of fine strains is imperilled. Nothing could appear better suited for the Tulips than the soil used in Mr. Barlow's beds; they were made up, as usual, with great care and according to the best rules of practice, and planting was done at the proper time. For a period the growth appeared promising, then it began to turn brown, and the leaves withered up. In Mr. Barlow's best bed row after row has been affected in this way; here and there a plant flourishes, but they are unfortunately the exceptions. On lifting the bulbs it is found that no roots have been put forth; and the keel of the root from which the roots are thrown out is found decayed in some of its parts, endangering the very existence of the bulbs. In some cases small offsets are formed; but the parent bulbs become weakened and small in size. Mr. James Thurston, of Wolverhampton, who is also a severe sufferer from the disease, states that he has some magnificently marked blooms, but nearly every one has blemishes owing to the disease. The Tulip show takes place at Manchester on May 27, but owing to the earliness and dry character of the season it is doubtful if many good flowers will be forthcoming; what with drying east winds, cold nights and bright sunny days, the flowers fade quickly. The disease, in combination with the weather, must affect the number of the flowers up to show form.

The Flower Garden.

PLANTING HARDY BEDDERS.—As soon as the beds are all prepared, as before recommended, a beginning may be made towards refilling them, commencing with the edging, for which purpose there is no more substantial and useful plant than the *Echeveria secunda glauca*, and it will be best that the outlines of the whole of the design should be indicated by this neutral tinted edging; it harmonises well with any colour which may be placed in juxtaposition with it, and it is also a good outline for carpet bedding, and wherever hardy plants, such as *Mentha pulegium*, *Gibbularium* and the various *Saxifragas* are used for the groundwork, they may be planted at once, leaving the proper spaces to be filled with tender plants later on, when all danger of frost is over.

RHODODENDRONS, AZALEAS, MOUNT PAEONIES, form now the most attractive feature in the flower garden and pleasure-grounds, and in order that the enjoyment of them may be complete, all the surroundings should be kept in the neatest possible order; grass lawns and verges should all be kept well mown, the edges of the walks and also of the beds neatly cut, and the roller constantly at work both on gravel and grass. As an adjunct to the flower display, the plants in the herbaceous garden are beginning to make an interesting feature amongst the abundance of bloom now prevailing everywhere, and the plants should be kept neatly tied to stakes, and the borders hoed and raked. The same attention must be paid to the borders of shrubberies and plantations, which are now contributing their share of beauty to the general display, such as common and Persian Lilac, *Berberis Darwinii*, several crimson Thorns, both single and double, amongst which Paul's double crimson is the most conspicuous; the double-flowered Japanese Cherry, *Cerasus Sieboldii*, which, as it attains size, will become one of the finest flowering trees we possess; *Magnolia Soulangiana*, purplea, and others, all beautiful; *Viburnum plicatum*, one of the most showy plants for the shrubbery in existence. The walks and verges should be kept constantly rolled and swept; Box edgings may also be cut now.

ANNUALS.—If not already done, advancing seedlings of such annuals as were sown early in the month will be very much benefited by pricking out under glass for a short time, or if at all thick they will be drawn up weakly; African and French Marigolds, Zinnias, Helichrysums, and some others absolutely require it. Many of the tender bedders, such as *Coleus Verschaffeltii*, *Iresine*, and *Alternanthera*, will be very much strengthened by being turned out of the pots and plunged into light soil under glass for a time, also, if pots are much wanted, a great portion of the stock of *Pelargoniums* and other well-rooted bedders may be treated in the same manner; these will all require complete exposure very soon, but do not be in a hurry to plant out the general stock, as the prevailing east winds are very scathing.

ROCKERY.—Amongst the many beautiful objects which characterise the present season the rockery stands first and foremost, the variety is so charming, ever changing and full of novelty, and to a lover of plants the interest surpasses anything which can be derived from the gorgeous inflorescence of bedded-out plants, so that every exertion should be used to keep up evidence of caretaking and neatness, not, however, carried to the extreme of formality, as the effect to be produced is what I should style a cultivated wildness. The *Tropeolum speciosum*, amongst other desirable plants, is well adapted for planting among the little interstices of the rockwork, and should have the assistance of branchlets of *Birch* to assist them in trailing about. The *Ivies*, too, should be assisted in their endeavours to attach themselves to the surface of the rocks. These should be confined to the small-leaved varieties, which are just now in their juvenile growth, and a very striking and important feature, worthy of every possible attention. The golden yellow of *aurea spectabilis* is very attractive, as is *nana marmorata* and many others. For rockwork on a large scale the abundant flowering *Genista hispanica* will be found one of the most desirable, its brilliant colour and compact habit of growth render it peculiarly suitable for planting amongst large masses of rocks. *John Cox, Rellap.*

The Hardy Fruit Garden.

THE disbudding of young trees of Peaches, Cherries, and Plums, ought now to be completed, observing that no more growths are retained than are needed. Nail in the most forward shoots requiring such attention at once, but do not secure them too near to the growing points, or the advancing growth will push forward and become crooked and twisted. Complete the general disbudding of Peaches and Nectarines as soon as possible. Carefully remove all shoots and leaves on which there are evidences of greenfly; disbud entirely the lower side of each branch as a means of shortening the work of selection, but make an exception of all growths with fruits at their bases by pinching back to a few leaves, and retain no more on the upper side than will be required to supply the place of those to be removed at the next pruning. In the interior of well-furnished trees it is thus plain that only one growth from the base of bearing shoots is in general wanted, and that all others may be removed, or pinched back where placed by fruits and at the point of the shoot. The growths may be entirely removed down to the best-placed base one where there are no fruits on the shoot operated upon, as no object will be served by retaining them. In disbudding extensions and branches required to furnish weak parts of the tree it will be well, after removing all growths on the lower side, and also all forelight shoots, to select the required number of growths for laying-in, and to pinch back a few of the others instead of removing them, as such spurs often prove useful on the main branches of the tree by yielding shoots to fill up any vacancies that may occur; but this remark must not be understood to apply to the work of disbudding generally, which would lead only to crowding and confusion, but only to branches intended to form the framework of the tree. Remove crowded and deformed fruits as the work proceeds, leaving the general thinning-off of fruits for a little while longer. Much attention will now be needed to the walls of the fruit garden, and the varied work of disbudding, pinching, and thinning fruits, will require, with the nailing-in of the more forward shoots, much labour that cannot be delayed without injury to the well-being of the trees. Continue the use of the garden-engine frequently, using it with such force as to dislodge all insects, while avoiding injury to the still tender foliage. If there is the slightest appearance of blister on Peaches or Nectarines it will be advisable to remove at once all affected leaves, and to give an application of Ewing's Mildew Composition at the strength recommended by the maker. An attack of mildew, should such unfortunately occur, may also be effectually combated by the same remedy. Complete the thinning of Apricots as soon as possible, leaving at this time no more than may be considered sufficient for a fair crop, which will depend more upon the state of the tree as to vigour, and the quantity and quality of the root-run, than upon any rule that could possibly be given as to the average distance apart at which fruits may generally be allowed to remain. Nail-in the growths as they advance sufficiently to require such attention; continue to keep a sharp look-out for the leaf-rolling grubs, and make their quarters as uncomfortable as possible by keeping the trees frequently washed.

Gooseberry caterpillars are making their appearance, and where the outbreak is not too widespread, can be best held in check by pinching the affected leaves with the fingers; as in all but the worst cases the depredators will in the earliest stage be found to affect only a few leaves, where they can be easily destroyed by the score before they have had time to distribute themselves. Proceed with the planting-out of Strawberries that have been forced; and if the ground has been prepared for them, as recommended in a previous Calendar, there need now be no delay in putting out the later batches as soon as the fruit is gathered. See that the balls are thoroughly soaked through with water before proceeding to put them out; plant firmly and deeply, and assist their establishment by watering freely, if the weather prove dry, before they have time to make fresh roots. Vines on walls are now sufficiently advanced to enable a selection to be made of such shoots as will be required for extension, and for furnishing the existing canes. Where the long-spur system is adopted it will be

necessary to retain the lowest break to replace each spur, as well as the growth selected to carry the bunch. If it be intended to replace old canes by young ones, decide at once upon those to be carried up for that purpose, and see to making them secure against wind by keeping them fastened in as they advance in growth. *R. Crossings, Castle Gardens, St. Fagan's.*

Grapes and Vineries.

GRAPES that are ripe will do without any fire-heat now that the weather is bright and fine. Admit air freely on the back and front ventilators in the daytime, but reduce towards evening, so that the house will be nearly closed through the night. Only a little air should be left on the back ventilators, which must be increased early in the day. Give sufficient water at the roots to keep the berries plump and in good order.

If red-spider has been troublesome, after the Grapes are cut use the engine freely on the foliage every evening, when it will soon disappear. Succession Hamburgs as they commence to colour must have liberal supplies of warm air; a little fire-heat in the daytime is very beneficial. Leave a little air on the front and back ventilators night and day, and increase it as the temperature rises until mid-day; afterwards reduce it as the sun-heat declines, always being careful to avoid cold draughts. A night temperature of 65° to 68°, with a rise of 10° by day, will be quite hot enough for Hamburgs. Let the laterals now run without stopping within reasonable limits. Damp the house down thoroughly in the early part of the day with tepid water, so that it will dry up while there is plenty of air on, and let the evaporating pans go dry. Those Vines that are swelling their fruit must have liberal supplies of tepid manure-water, and must be looked over with the scissors for the last time, taking out any berries that are likely to become crowded, but still left thick enough to support each other when cut and laid on a dish. Close the house early in the afternoon with plenty of atmospheric moisture, and keep the evaporating pans filled with weak manure-water. The latest Hamburg-house must now be closed if not already done, as a little beat helps to draw out the bunches. No fire-heat will be necessary for a few days after closing if the weather is bright and fine, but I always use a little fire-heat as they come into flower, as it makes the atmosphere light, and the pollen disperses better. Give a good soaking of tepid water to the inside borders before starting; the outside borders will be generally wet enough for some time yet. Stop the shoots at about four joints beyond the bunch, and tie them down as they require it. Muscats can be kept at a night temperature of 70°, with a rise of 10° by day, closing the house early in the afternoon, and on bright days with sun-heat the thermometer may be allowed to range from 90° to 95° if plenty of moisture be given. It is a good plan to damp the houses down occasionally with weak manure-water. If red-spider appears sweep the leaves either with clear water or 4 oz. of Gishurst Compound to the gallon of water. Do not sulphur the pipes until the skin of the berries is hard enough to stand it, or it will rust them. The late varieties of Grapes, such as Alicante, &c., will now be ready for thinning, and must be more severely thinned than other varieties, so that the air can circulate among the berries. Take out all the inside or cross berries, leaving only those that point directly outwards, and the result will be handsome bunches that will keep well. After the thinning is completed give the borders a thorough soaking with tepid manure-water. Keep the night temperature 65° to 70°, with a rise of 10° by day, and close the house early in the afternoon.

Vines in newly-planted vineries will now be growing fast, and will take liberal supplies of clear tepid water. Admit air freely on bright days, and close early in the afternoon. Vine-eyes in pots for early fruiting next year must have liberal treatment, so as to get the growth matured early. Tepid manure-water must be used when the pots are filled with roots, and stop the shoots when they have grown to the required length. *Joshua Atkins, Loking Gardens, Wantage.*

The Pine Stove.

FOR the next two or three months all available space will be required for fruiting plants, succession, and young stock. Extra accommodation can be got by putting a number of succession plants into large frames, placed on hotbeds. The plants do well in these places, and lay the foundation of a robust constitution. Those short, thick, and broad leaves are formed, a point so desirable in Pine growing. These plants should at all times have their own quarters, therefore the space in spring is at times circumscribed. By the addition of frames, other conveniences are obtained, and a larger number of plants can be fruited without the aid of additional permanent houses. When the fruiting plants are drafted out, the plants from the frames can be gradually cleared off to fill up all vacant places. Attend to the linings of pits and frames, in which the heat should be steady and continuous. Those plants that should fruit in early autumn are ripening, and at this season and afterwards the fruits have that luscious, juicy flavour no other fruits have. Let down the shadings every night as before advised, for any covering, however slight, greatly assists in keeping up the temperature. All frames should be covered over at night with Frigi Domo, or thick mats; and if these are not sufficient for top-heat, a double mat will greatly assist in raising the temperature during the night. Keep the temperatures the same for the present as advised in my last, and do not neglect early closing, so important in all forcing, which makes the most of solar heat. Start the fires early in the afternoons, which will prevent the day temperatures falling too rapidly, and these should be well maintained up to 10 P.M. as before advised, which reduces the firing when the external temperatures are at their lowest point. Study the atmospheric conditions, and those varied remarks given in former Calendars will answer either for hot-water pipes, flues, or fermenting materials. If the crowns of the fruits are likely to get too large this arises from different causes—being too far from the glass, excess of moisture in the atmosphere, or too much liquid-manure. Pines should at all times and in all stages be grown close to the glass. If succession plants are inclined to become drawn or otherwise weakly in their young growth, two of the most primary causes are being too far from the glass, or the atmosphere too humid; if these conditions are reversed this can easily be corrected. Take suckers from plants from which the fruit has been cut, and subject the old stools to the treatment previously recommended. By this process if a little brown-scale is on the old plants the young suckers come up clean. Another way of inducing the old plants to form suckers, after the fruit is cut, is to shorten back the leaves to within 8 or 10 inches of the stems. Plunge them thickly together in a bottom-heat of 90°. Pot the crowns of the good varieties of Charlotte Rothschild and Smooth Cayenne, as these varieties are very shy in reproduction. Those plants that showed fruit in January and February are swelling fast. Stake all fruits before they become too large, and water them every time with liquid-manure. The temperature for the water for syringing and watering should not be under 55°. If the pots dip on one side make them level; as the bed decomposes and shrinks the pots require attention. If the plunging materials are very dry give them a good soaking with tepid water. *D. Wilson, Castle Hill, Devon.*

FRUIT NOTES.

Apple Sturmer Pippin.—This tolerably well known kind is now in splendid condition for dessert; it makes a showy and attractive dish at this part of the year, and is certainly one of the best late-keeping dessert Apples we have; the tree is hardy, and a good bearer, and the fruit keeps very plump and firm, and almost equals a Nonpareil for flavour. Another good late variety not so well known as the former one is Ord's Apple; this promises to be a good cropper and keeper, and is also of very good quality. The tree, depending in habit, and vigorous; the fruit light green on the shady side, changing to a pale yellow, and dark red next the sun, which becomes brighter as it ripens; flesh crisp, firm, and juicy, and of good flavour. *W. H. Davis, Buryley.*

The Alexander Peach.—From what I have seen of the Alexander Peach I am of opinion that it is a very valuable early variety. I gathered the fruit from it on April 22 this year and May 2 last year, growing it in an early house against such as Early Rivers, Early York, and other early varieties. I find it to ripen a month earlier than any of these. The fruit is of a good size and colour, and I think it will become a great favourite among Peach growers. *E. Smith, The Gardens, Kewville, Cosham.*

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY,	May 23	Royal Horticultural Society: Great Summer Show (three days); Meeting of Fruit and Floral Committees, at H.A.S. 4; Scientific Committee, at F.S. 4; Sale of Plants at the Jerildon Nursery, by Protheroe & Morris; Presentation of Testimonial to Mr. Moore, at Cannon Street Hotel.
WEDNESDAY,	May 24	Annual Meeting of the Linnean Society, at 37, St. James's Place; National Horticultural Exhibition opens at Manchester.
FRIDAY,	May 26	Sale of Plants at the Church Walk Nursery, Stoke Newington, by Protheroe & Morris.

MANY of our nurserymen have now experienced great difficulties in the transit of their plants to the Vine-growing districts of the Continent and of our colonies, by reason of the enactments in force in various Continental Governments with reference to the PHYLLOXERA. In view of the facts mentioned in the following communication, those difficulties are not likely to diminish.

Nothing but experience will convince the powers that be of the futility of their policy. Facts and argument are thrown away when a *douanier*, or custom-house officer, is suffered to be judge whether any particular dispatch is likely to be the means of introducing the dreaded insect. Meanwhile, in order to provide an imaginary safeguard to one industry the interests of many others are sacrificed.

By the rules of the Berne Convention those countries which have signified their adhesion to that document are more or less favoured; but those countries which have not given in their assent are, as it were, left out in the cold. If custom-house regulations could suffice to exclude the insect there would be some sense in the restrictive enactments, and so far as those enactments are directed against the importation of Vines in any shape, there is nothing that can be reasonably complained of; but in the case of other plants—of Potatoes, bulbs, seeds, &c.—the case is quite otherwise. The Royal Horticultural Society has not been backward in protesting against these regulations, and we, while upholding all reasonable restrictions, have taken many opportunities of exposing the ridiculous nature of many of the supposed safeguards. So little support, however, have we received from those most interested that we can but believe, either that the matter is unimportant to our exporters or that means have been found of evading the provisions of the law; and if so, the value of the enactments is, after all, not great. Indeed, we have had reason to believe that the law as put in practice is not so severe as it appears to be on paper, in spite of the remonstrances of those who have had their bouquets taken from them on the frontiers, while hay carts were allowed to pass. In any case, we would counsel those about to send consignments of plants abroad to make an affidavit before the Consul of the country to which the goods are consigned that the plants in question not only are not Vines, but that they have not been grown in the same establishment with Vines. Belgium has, if we are rightly informed, become one of the contracting parties, and has thus a *locus standi*; and if this be so, her nurserymen, having, under certain conditions, the right to send plants into other countries, will not be such sufferers as heretofore, and the risk of Belgian competition in this country, already considerable, will not be so great as it promised to be when the Belgians, having no outlet from their own country to their Continental neighbours, began to invade our territory.

The following is the official document, which has been transmitted to us for publication.

“(Copy).”

“Foreign Office, May 15, 1882.”

“With reference to the letter from this office of December 20 last respecting the International Phylloxera Convention, I am directed by Earl GRANVILLE to state

to you that his Lordship has received a despatch from HER MAJESTY'S Minister at Berne reporting that the ratifications of the revised Convention have been exchanged by Austria-Hungary, France, Germany, and Switzerland; Portugal has not yet ratified it. Mr. ANAS adds that in addressing the Swiss Legislature on the subject in April last the Vice-President of the Confederation observed that Italy had refused to adhere to the Convention, not because she considered it too severe, but because she thought it was not severe enough; she will not, therefore, be a dangerous neighbour to Switzerland. The Vice-President also stated that Switzerland was winning the battle against the Phylloxera, and must persevere in the road leading to that success.—I am, &c., “CHARLES W. DILKE.”

—*TELOPEA SPECIOSISSIMA*.—When Sir GEO. MACLEAY recently showed, through his gardener, Mr. GREEN, a fine flowering branch of this noble Protead, we intimated our intention of giving an illustration of the plant. We now redeem our promise (fig. 106), and only regret that the black and white of the engraving cannot do justice to the clear pink-coral colour of the flowers or the rich crimson tint of the environing bracts. We may refer to our statement at p. 500 for a brief account of the history of the plant and its mode of culture by Mr. GREEN, merely reiterating the fact that the specimen produced by that skillful cultivator is not only superior to all that have been figured before, but surpasses the ordinary condition of the Waratah in its native country (New South Wales). We can but hope that Mr. GREEN'S success may be the means of inducing others to undertake the cultivation of these noble plants with those sumptuous grandeur our forefathers were much better acquainted than we are. Abundance of water during the growing period, dry heat during the process of maturation, and something approaching drought during the resting stage, would seem the necessary conditions of success.

—*AUCUBA POLLEN*.—So many applications have reached us relative to the supply of this, that we think nurserymen might find it worth their while to advertise, or at least supply, it. Better still would it be if those desirous of securing the scarlet berries would purchase a male plant and plant it in their shrubberies. From our own experience we should say that one male plant is sufficient to fertilise all the female plants within a range on all sides of at least a quarter of a mile. In those cases where the male flowers open before the female we would recommend that the male flowers be gathered and kept in a dry place for a week or two, and the pollen then applied with a camel-hair pencil. We have never experienced any difficulty in the matter, and we know from experience that the pollen may be kept in a dry place for many months without losing its vitality. The plan has been tried of grafting the male on the female plant, with the result that it in time outgrows the stock, and the plan found to answer best is that of growing the male plant in a pot, and setting it when in flower among the female bushes, or alongside of them.

—*GARDENERS' ROYAL BENEVOLENT INSTITUTION*.—We learn that it is proposed to institute a simultaneous collection throughout the country on Monday, July 31, for the purpose of increasing the Pension Augmentation Fund. It will be remembered that the object of this movement is to provide sufficient funds to increase the scanty annual stipends now paid to decayed gardeners or their widows. A large number of annual pensioners is now on the list, subscribers to the Society for a certain number of years having the right to claim the benefit of the Institution without the trouble and expense of election. It is obvious that to secure these benefits annually and to increase the pensions as proposed a large reserve fund is requisite, as well as annual subscriptions. It is, therefore, most desirable that every effort should be made to compass these ends. It is not every gardener who can afford his annual ginea (though none who can do so should neglect to contribute in this way, on the grounds of self-interest no less than on that of beneficence to others less favourably placed), but every gardener, and every garden labourer even, can afford his mite to increase the pensions. It is with the special object of securing these mites that the simultaneous collection is organised, and we trust it will meet with the success it deserves. Nurserymen, head-gardeners, and employers generally may do a good service by bringing the matter under the notice of their *employés*, and by

reminding them that the smallest subscriptions will be welcome. Possibly the committee might see their way to accord the privileges of a life subscriber to those who shall collect in this way funds equal in amount to those requisite to constitute a life subscriber, and in this way to stimulate charitable effort. The annual dinner of the Institution will be held on June 29, under the Presidency of the Lord MAYOR, who will be supported by the Sheriffs, the Master of the Fruiterers' Company, and others. The Society has a reserve fund of over £15,000, but before the pensions can be augmented in value at least an additional £5,000 must be raised. The collection of this amount should not require any very lengthened period if every gardener would do his best, by example and influence, to facilitate it.

—*SIR JOHN BENNET LAWES, BART.*—It is satisfactory to have to record, that the life-long services of this eminent man to chemistry and agriculture have at length been officially recognised. Few men have rendered the State more service than he. His merits have long since been acknowledged by the scientific institutions of the country and of Europe, and the agriculturists themselves have not been unmindful of the laborious experiments carried on for so many years with the aid of Dr. GILBERT. If we cannot boast many agricultural stations and experimental institutes, as they may do in Germany or America, at least we may boast of one wherein it is hardly too much to say that the work done has exceeded in amount and intrinsic value that of all the rest put together. We could wish that the State could devise some special order of merit for such recipients as Sir JOHN LAWES, and not put them on a level with political partisans, municipal dignitaries, or successful traders. Meanwhile Sir JOHN LAWES honours the baronetcy more than the baronetcy honours him.

—*OTHONNOPSIS CHEIRIFOLIA*.—Plants that will flourish by the seaside are not so numerous but that additions to the list are welcome. Mr. T. BUNYARD, of Ashford, sends us specimens of this long known but rarely seen Composite shrub, said to be hardy by the sea, but as the plant is a native of the Cape of Good Hope we should imagine that it will prove hardy only under exceptionally favourable circumstances. In any case it is a striking plant or undershrub, with long fleshy ovate leaves tapering to a long stalk, and with yellow flower-heads about 1 inch across, and surrounded by an involucre of one row of oblong erect bracts.

—*ANNUAIRE GÉNÉRAL D'HORTICULTURE*.—An international directory of nurserymen, seedsmen, and gardeners holding public appointments throughout Europe and America is in course of publication at Toulouse. Communications should be addressed to M. le Directeur de l'Annuaire Général d'Horticulture, 7, Rue Mataubau-Bonnefoy, à Toulouse, France.

—*EXHIBITION AT BORDEAUX*.—A great exhibition of agricultural, horticultural, and industrial objects will be held at Bordeaux, under the auspices of the Philomathical Society, from June 1 to October 31. The horticultural portion comprises classes for horticultural buildings, apparatus, tools, flowers, seeds, vegetables, and forest products. Exhibitors of all nations are invited, but prizes will only be awarded to exhibitors belonging to France, Algeria, the French colonies, Spain, and Portugal. For plants, &c., there will be ten series of exhibitions, each lasting a fortnight. The programme is very comprehensive. Communications on the subject should be addressed to M. le Président de la Société Philomathique, Bordeaux France.

—*PRIMULA MOLLIS* is a most distinct Primrose, first introduced to this country from Himalaya nearly thirty years ago. For many years, however, it was probably lost to cultivation. A good specimen in fine flower may be seen in No. 6 house at Kew, and also another planted out on the rockwork. The species was figured in the *Botanical Magazine* for 1854, tab. 4798, and is there stated to be intermediate between *P. sinensis* and *P. cortusoides*. It has long stalked cordate leaves, hairy on both surfaces, the petioles clothed with spreading white hairs. The scapes are a foot or a foot and a half in height, and bear three or four whorls of flowers, the calyx and corolla tube being red and the spreading limb deep rose with a dark blood-coloured ring round the eye.

FIG. 105.—TELLOPIA SPECTABILIS: FLOWERS CORAL-RED, BRACTS CRIMSON. (SEE P. 676.)

— THE RECENT HURRICANE.—Every additional storm visitation does but serve to show us the greater need of shelter-breaks, and these formed of trees that have in them something more substantial than the Elm has. Though one of our noblest of forest trees—perhaps in some soils the very finest of them—yet it is found to be the most dangerous, for when it has reached those dimensions which extort our admiration it also becomes a source of danger to all brought within its range. The national antipathy shown on the part of landowners of all sections to lop large trees is too well known to need special mention, but were this antipathy less prevalent, and the ordinary requirements of common sense and experience practised, many thousands of the noble trees that have fallen from their high estate during the past few months might still be standing, and would, if for a time less grand, be yet serving the useful purpose of forming shelter and assisting to stay the rage of other storms. Trees, however, have not alone been injured, and tree shelters alone have not been missing. Over many large breadths of Peas the damage done has been excessive, and specially so is this the case where the rows ran lengthwise to the wind and there were no hedgerows to break its force; such hedgerows, whipped and twisted by the wind have suffered severely, whilst in other cases, where the rows ran in the cross direction, the harm done has been but trivial. With an anxiety that is always on special occasions made manifest, and is, perhaps, but natural, we have had from various quarters all sorts of suggestions as to the cause of so much injury to leafage, but the right one seems to have been studiously ignored. The real causes, as elsewhere explained, are to be found in the excessive friction caused by the terrible force and pressure of the wind, allied to the very tender structure of the immature foliage. Where salt might have equally fallen, and where frost might have been equally destructive, no harm was done, if the wind did not play directly upon the tender growth.

— DEIMYS WINTERI.—This plant is now flowering freely in the winter garden at Kew; it is an evergreen, with umbels of creamy-white flowers. In sheltered places of many parts of England it will succeed in the open air, but the pleasing green of its foliage and the large umbels of flowers render it a desirable object for cultivation in the cool conservatory. Its bark is the "Winter's Bark" of commerce, so called by reason of its use having first been brought into notice by Captain WINTER, who accompanied Sir FRANCIS DRAKE, in the year 1578, to the Straits of Magellan, where it was first discovered; the species, however, extends all along the west coast of the vast continent of South America.

— HARDHOOD OF CYCADS.—Baron von MUELLER writes from Melbourne:—

"I see by one of the December numbers of the *Gardener's Chronicle* that *Cycas siamensis* resists the freezing point. But in all probability the grand *Cycas media* would also endure open-air temperature, sinking occasionally quite as low, if the plants were well established previously by shelter culture, and if the position of such a 'Pine Palm' be not exposed to cutting winds. I kept *Cycas revoluta* with impunity in the open air of the Melbourne Botanic Garden through several years-winter, though sometimes the thermometer sank as low as 21° Fahr for a few hours." In Southern Japan, far outside of the tropics, though in an insular climate, it will have to submit naturally to some frosts also. Hardier still than the *Cycas* species are the *Macrozamia*, of which *M. spiralis* grows naturally as far south as 37° in East Australia, and *M. Fraseri* as far as 35° in West Australia, and I believe that they are quite hardy in Southern Tasmania as far as 45°. I have no doubt that all the other *Macrozamia* could also stand some frost, unless perhaps *M. Demsoni*. As is well known, one genuine *Zamia* is indigenous in Florida, and several extend into extra-tropical regions of Mexico while in Central America *Z. Chigua* or an allied species ascends to 7000 feet. All these will have to encounter some amount of frost. In fact, it is clear that many *Cycadeoid* could with safety be placed unprotected in localities occupied in gardens by the hardiest of Palms, and there is every reason to believe that within British ground in Europe they could be kept in the open air of the Channel Islands, at not even at Arran. That even very tall *Zamia* and *Cycas* stems can be exported at very long distances packed as dead goods in closed wooden cases deprived of leaves and soil, for subsequent revival

in gardens, I have shown very many years ago. The South African species of *Enephalartos* endure the night frosts of Melbourne also perfectly well."

— ATRAGENE ALPINA.—Many authors do not consider that this plant should belong to a genus apart from *Clematis*, the only difference between the true *Clematis* and the *Atragene* being that the former have sepals only, whilst the latter have both sepals and petals. *A. alpina* is a pretty deciduous climber, with long-stalked drooping blossoms. In colour these vary from white and sulphur to dark blue or reddish. *A. sibirica* of nurseries, and books, too, is identical with *A. alpina*.

— HERBACEOUS CALCEOLARIAS AT BEDFORD HILL HOUSE, BALHAM.—The named varieties of herbaceous *Calceolarias*, such as raised by many of the celebrated growers of these plants that were going twenty or thirty years back, were remarkable for two things—the perfection of form and marking of the flowers, according to the florist's standard, and for their weakly, indifferent constitution. To the latter serious defect was, no doubt, attributable the majority getting so much out of favour amongst the majority of those who cultivate plants for ordinary decorative purposes, and who reasonably avoid things that are found wanting in stamina, such as the *Calceolarias* in question. The continual selection for seed-bearing purposes of plants that, however beautiful the flowers were in form and colour, were yet scanty in number, and the foliage deficient in size and quantity, was sufficient cause to account for the neglect into which they had fallen. Of late years a different course has been followed by a few growers who have taken this section of these beautiful plants in hand, and have made strong and vigorous growth, with a dwarf compact habit, the basis on which they have worked, and after securing this have gone in for the properties of the flowers afterwards, and so successful is the result that, as with *Cincratias*, *Gloxinias*, *Primulas*, and some other things that to secure flowers of the required character it used to be necessary to propagate from the old plants, they may now be had from a good strain of seed possessing all the requisite properties in the flowers, combined with habit and vigour of growth, that it would be difficult to improve upon. Amongst the most successful raisers of these greatly improved *Calceolarias* is MR. RAPLEY, gr. to J. BRAND, Esq., Balham, who in recent years has frequently exhibited groups of his seedlings, alike excellent in every way. An opportunity we lately had of seeing the stock, which consists of some 400 plants, enables us to pronounce them even better than they have ever been before. They fill a wide front stage in a lean-to house about 100 feet in length. The self colours range from ivory-white, through light to the deepest yellow, from pink through the various shades of red to the darkest velvety crimson and maroon, combined with others that have the blotched face of the pouch edged with a distinct colour, and again others that are spotted and freckled with every imaginable shade. They are grown in pots from 6 to 8 inches diameter; with this limited root-space many of them ran from 18 inches to 2 feet across, measured through the dense head of flowers which literally lie packed so closely as to overlap each other; the biggest plants are from 15 to 18 inches high, standing without any need for sticks. The broad massive foliage which half covers the pots all but hides the stems, forming a groundwork to the mass of bloom which each plant presents, and effectively tones down what otherwise would be an overpowering amount of colour; the individual flowers are well formed and of unusual size, some of the largest measuring just 2½ inches across the pouch. It would be difficult to imagine anything more effective for greenhouse or conservatory decoration, especially as when once in flower they may be stood about in places where one would hesitate before putting plants of a more costly character.

— RANUNCULUS GRANDIFOLIUS.—In the *Botanical Magazine*, tab. 4625, this fine plant is figured under the name of *R. cotuifolius*, by which probably it is more widely known. It is by no means a common plant, and probably does not succeed everywhere; where, however, it does grow well it makes a splendid show. We have a lively recollection of seeing a profusion of it some years ago in a wonderful garden near Farnham (that of the late MR. GILES MUNBY), where large self-sown clumps of it made a

grand show. The letterpress accompanying the above-mentioned figure states it "is unquestionably the handsomest of all the Buttercups yet known to botanists. The flowers are not only large—more than 2 inches across—but of a singularly glossy yellow colour; and although a native, as it would seem, exclusively of the Canary Islands and of Madeira, it is quite hardy." It attains a height of from 2 to 4 feet; the large root leaves, between round and kidney-shaped in outline, have long hairy stalks, and the large flowers are borne in cyme-like panicles. Now in flower at Kew.

— CAMELLIAS AND CLIMBING ROSES.—At Furze Down, Tooting, there is a large house with two rows of *Camellias* planted out in the body of the house, and the back wall occupied by these plants as well, the rafters being covered with climbing *Roses*. There are few arrangements that do better than this, for several reasons—the extra warmth that is beneficial to the *Camellias* whilst making their growth suits the *Roses*, which, so treated, grow away vigorously, supplying a large quantity of flowers, at the same time giving a little shade, which the *Camellias* enjoy. Another advantage is, that the insects—aphides and red-spider—more or less inseparable from the cultivation of *Roses*, but which little affect the *Camellias*, can be easily kept from being injurious if the syringe is freely used.

— LINNEAN SOCIETY.—The anniversary meeting for the election of Council and officers, and President's address, will be held on Wednesday, May 24, at 3 P.M.

— CYTISUS PRÆCOX.—This beautiful and free flowering shrub, stated to have been raised by MR. WHEELER, of Warmister, between *C. albus* and another species, perhaps the common *Broom*, is, it appears, distributed in gardens under the names of *C. odoratus*, *C. albus* var., &c. From MR. PARKER, of Tooting, we learn that seedlings of this plant revert to *C. albus*.

— THE EFFECTS OF THE RECENT GALE.—Perhaps nowhere else can the effects of these gales on vegetation be more strikingly traced than at High-bridge, between Bridgewater and Weston-super-Mare. Here there is an immense flat plain stretching away to the seaboard at Durham. Over this plain the wind must have sped with terrific force, for the hedgerows, Thorns, and other trees are as brown as if they had been scathed by fire. For a considerable distance the traveller sees but little of green leaves, and it will occupy a season—if that does not prove short—for the stricken plants to regain their spring verdure. The rich green of the pasture-land is in marked contrast to the withered hedgerows, &c.

— SINGLE DAHLIAS AS POT-PLANTS.—It is probable that some of the more striking varieties of the single *Dahlia* will make good exhibition specimens grown in pots. At the recent exhibition of the Torquay Horticultural Society, Mr. R. T. VEITCH exhibited a few varieties growing in small pots, and though the plants had been pushed on to get them into flower they were very pretty indeed, and bloomed with great freedom. If grown on generously into good size in sufficiently large pots till the plants become somewhat pot-bound, and then treated to a little liquid manure, the plants would no doubt make fine decorative objects in a conservatory, and carry on a supply of cut flowers till a period some time after the plants were cut down in the open air. The experiment is worth trying.

— LIGHTNING-STUCK TREE.—The conversion of tall trees into lightning conductors is a common event, and usually one attended with very disastrous results to the tree. The moral of such an event, doubtless, is that our finest and specially most valuable trees should have the protection of an artificially constructed conductor, but perchance the expense would, to be really effective for all trees, be greater than many owners of trees would care to meet. Early last week a heavy thunderstorm passed over the Reading district, and during its presence the electric current struck a noble deciduous Cedar that stands in the grounds of the Wilderness at Earley, and, singularly enough, did little harm to it. The current struck the tree at its highest point, and thence descending the surface of the stem plunged into a groove from the bark from 1 to 2 inches in width, sending the

bark flying from the tree in small shreds to a distance of 30 feet. At about 2 feet from the ground the current, which in all cases had avoided limbs, here met with a large one, and dividing produced two distinct grooves, and finally entered the earth, though here it first ploughed up the turf to a depth of 6 inches, and for several feet round the tree. Though thus struck, it is satisfactory to find that the tree shows no further injury. When the tree was struck the effect resembled that of an instantaneous discharge of musketry. Phenomena of this kind tend very forcibly to illustrate the danger of standing at the base of a big tree when a thunderstorm prevails.

— **BERRERIS SINENSIS.**—According to LOUDON this species was first discovered during Lord MACARTNEY'S mission to China, and was introduced into England in 1860. It is the most graceful of all the numerous species of *Berberis* cultivated at Kew, the branchlets from the base to the crown of the plant weeping, and being loaded with long racemes of yellow flowers. The figure in LOUDON'S *Encyclopedia of Trees and Shrubs* gives no idea of the graceful habit of this species.

— **CAMELLIA-COVERED WALLS AT BEDFORD HILL HOUSE.**—If evidence were wanting of what plants are the best for covering the walls of greenhouses and conservatories, a sight of the Camellias on the back walls of a long lean-to greenhouse and conservatory here would completely settle the matter. In the greenhouse in question the wall is not only covered with the shoots secured to it in the ordinary way so as to form a covering, but the plants have made growth that is in a great measure left to itself, so that the branches of each stand out from the face of the wall, 3 to 4 feet, presenting a close mass of shoots, covered with the densest of healthy leaves from bottom to top. The plants are turned out in the border, requiring a minimum of attention in the matter of water, and yielding thousands of flowers. In the conservatory, which is a lofty structure, the plants have reached the top, and are in a most luxuriant state, although the position is such that not every thing would thrive through want of light. So late as the middle of May there were dozens of fine blooms open on them, in fact, where planted out and in healthy condition, after they have attained size and strength, the time they keep on blooming is such as to lengthen their season of flowering beyond that which occurs when their roots are confined in pots or tubs. A selection of the best kinds are here used.

— **MEDINILLA MAGNIFICA.**—A plant growing in a 16-inch pot, and which measures 7 feet in height and 6 feet in diameter, is now in bloom, with sixtysix magnificent racemes, in the Royal Gardens, Wilhelmshöhe, near Cassel, Germany. The average length of the racemes is 21 inches, and the plant is greatly admired by all visitors.

— **THE DALKEITH YOUNG GARDENERS' MUTUAL IMPROVEMENT SOCIETY.**—The session of 1881-82, which has just been brought to a close, has been the most successful of any since the institution of the Society in 1878. The programme for the past session extended to a wider range of subjects than has been the rule hitherto, and papers were read by several young men from neighbouring gardens, which added considerably to the interest of the meetings, and aided the discussions on the various questions brought forward. The meetings are held weekly from October to April, and the attendance during the past session has been very regular and exemplary on the part of the members, with whom, of course, it is voluntary. Mr. WILLIAM MILNE performed efficiently the duties of Secretary during the session. The following subjects, among others, have formed the text of really useful and interesting papers:—"Notes of Interest from a Holiday Tour," "Stoves and Stove Plants," by Nimrod Sherwood; "Vine Culture," and "Peach Culture," by John McKinnon; "Nutritive Organs of Plants," and "Reproductive Organs of Plants," by William King; "Floral Decorations," by James Dickie; "Rose Culture and Forcing," and "Asparagus Culture," by John Clark, Newbattle Gardens; "Landscape Gardening," by Alexander Westland; "Insecticides," by William Milne; "The Wants of Man," by James Grant; "Agriculture," by Thomas McKenzie, Newbattle Gardens; "Lessons of Chemistry," by James McDonald; "The Potato," by David Ramsay,

Drum Gardens; "Vegetable Growing for Seed Saving," by Robert Davidson; "The Chrysanthemum," by John Lindsay, Newbattle Gardens; "History and Culture of the Dahlia," by Isaac Milson; "Wall and Fence Climbers," by James Nicoll, Newbattle Gardens; "Roots," by Thomas Donaldson, &c. A marked improvement was shown in the general composition of the papers, and the points touched upon were criticised with intelligence and interest. Questions upon various interesting and useful subjects were frequently laid before the meetings, and brought out much useful information in the discussions which followed in reply to them. The questions embraced such matters as "What is the Best Method of Preserving Hardy Fruits during Winter?" "The Best Method of Packing Fruits and Flowers for Travelling Long Distances?" "The Proper Definition of the Term 'Florists' Flower'?" "The Electric Light: will it ever become beneficial to Horticulture?" "Large or Small Gardening Establishments: which are the better of the two for young gardeners learning their profession?" "Peaches and Vines: which are the easier managed to attain good results?" "High or Low Night Temperatures: which are the most beneficial to plant life?" "Is it advisable to flower *Eucharis amaranica* oftener than twice a year?" and other queries on topics of a similar nature. Such instructive meetings and well-conducted discussions must prove beneficial to the young men in after-life.

— **WINTER GREENING APPLE.**—Miss FAWCETT has sent us a Winter Greening Apple gathered in her garden at Springfield, Knowl Hill, near Twyford, on the 8th inst. It had, with a dozen others, remained on an espalier tree throughout the winter, and appears to have only thoroughly ripened amid the fresh blossoms now adorning the tree.

— **THE CONSERVATORY AT FURZE DOWN, TOTTING.**—The conservatory here affords a good illustration of what may be accomplished in the way of effective grouping where there is a large, well-appointed structure, occupied by plants of a character alike suitable for the purpose, and that will thrive in the description of house in which they have to be located; for the house in question, like many others attached to a mansion, has been built with quite as much view to external appearance as to the well-being of the plants it was intended to contain. It is a handsome, roomy structure, consisting of glass and massive stonework on the side which forms the front overlooking the lawn; on the opposite side there is no glass, but the surface of the wall has been judiciously dealt with by forming narrow recesses enclosed with glass, that can be opened or shut at will. These are filled with Ferns, Palms, and other suitable things, mostly planted out, the rest in pots. A fair amount of light reaches the body of the house from the roof, but in front this all-essential element is only admitted in limited quantity through the presence of the masonry; the body of the house is connected with one of the rooms of the dwelling by an extension, in the shape of a short corridor. No stages of any kind are used, on the floor along the middle are three moderate sized circular groups of plants, each of which has a noble Tree Fern, with a straight tall trunk for its centre, surrounded with suitable material round the large boxes in which they are growing; on these are arranged, as also hanging from the trunks of the Ferns, a quantity of Orchids in flower, consisting of *Odontoglossum*, *Oncidium*, including *O. Lanceanum*, *Dendrobium*, *Cyrtopodium*, and others: these have a pleasing and natural appearance. Right and left, on either side of the narrower portion of the structure which leads to the room already mentioned, as likewise on both sides of the body of the house, and its opposite end, there are groups of plants arranged so as to present an irregular outline; they consist of lofty Palms, *Dracenas*, Ferns, and the like, intermixed with flowering plants of whatever may be in season, and of which large quantities are brought on in other houses. All the groups are edged with *Selaginella Kraussii*, grown in wire troughs filled with moisture-holding material. Mr. LAING manages to arrange the whole so that each group, from the floor level up to the top line of the tallest plants, is well broken up, avoiding the even slope so often apparent where grouping in the natural style is attempted, and which is frequently spoilt through want of the surface being sufficiently relieved. The plants are all grown in pots or boxes, yet the grouping is so managed that scarcely anything of them is

seen; the great advantage of this over the planting out system is, that the entire appearance of the house can be varied at will, by altering the position and character of the groups from time to time as deemed desirable, which, with plants that are stationary, as where planted out is impossible.

— **PHYLOXERA IN AUSTRALIA.**—The most strenuous efforts, it is stated, are now being made by the Victorian authorities to stamp out the *Phylloxera*, which is seriously threatening the ruin of all the vinegrapes in the colony. Every vineyard in the Geelong district has been, or is to be uprooted, and so completely is the work being carried out that even Vines trailing over verandahs round a country house are ruthlessly sacrificed. When the work has been finished, the nearest vineyard will be separated from the infected districts by a belt of some 30 miles of country. This has been fittingly considered a proper case for compensation, and the adjoining Colonies have agreed to bear their fair share of the cost. The value of the Vines destroyed has been appraised, and it is estimated that the total sum to be paid to the vigneronists will amount to some £25,000.

— **TUBULAR FLOWER AND TREE STAKES.**—Messrs. DROOKES & Co., 4, Cathcart Street, Manchester, have lately introduced a new iron tubular flower and tree stake, for which they claim the advantages of cheapness, lightness, durability, strength, resistance to wind pressure, stand driving in deep, withdraw easily, and pack away conveniently. The new stake aims at superseding the rapidly decaying wooden stake, and is made in sizes ranging from 2 feet long, $\frac{1}{2}$ inch thick, and weighing 7 oz., to 7 feet long, $\frac{3}{4}$ inch thick, and weighing 3 lb.

— **FRUIT BOXES.**—Messrs. THOMAS CHRISTY & Co., 155, Fenchurch Street, have sent us a sample box made for a dozen Peaches, or other early valuable fruit, desired to be sent away as presents or otherwise. We need only further add that they are cheap, simple, and handy.

— **PRESENTATION TO MR. MILLER OF CLUMBER.**—On the retirement of Mr. MILLER from the management of the Clumber Gardens, he was recently presented with a purse of gold by a few old friends and well-wishers, as a slight mark of the esteem and respect in which he has been held during his twenty years' residence in the neighbourhood of Worksp. His departure from Clumber is much regretted, and his friends hope soon to hear that he is in harness again.

— **THE WEATHER.**—General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending May 15, issued by the Meteorological Office, London:—The weather has been generally dry and fine, though some thick fog was experienced during the earlier part of the period at many of our western stations. The temperature has been about equal to the average in the south and south-west of England and south of Ireland, but 1° or 2° below it in all other places. The maxima which were registered on the 11th were as high as 71° in "England, S.," and 70° in the "Midland Counties," while on the 9th the thermometer fell as low as 31° at Durham and Cirencester, and to between 33° and 35° in most other places. The rainfall has been equal to the mean in "England, N.W.," but considerably less in nearly all other districts. Bright sunshine has been more than that recorded for some weeks past, the percentages ranging from 44 in "Scotland, E.," to 64 in "England, N.W.," and 62 in "Ireland, N." Depressions observed:—During the greater part of this period a large area of high pressure held steadily over our southern coasts and France, while some small shallow depressions moved from west to east over, or to the northward of Scotland. The wind was consequently from the westward, or north-westward, and generally light, or moderate in force; in Scotland, however, it reached the force of a gale for a brief time on the 12th. By 8 A.M. on the 13th the high pressure area had extended northwards, and during the remainder of the period moderate easterly or north-easterly winds prevailed on all our coasts.

— **GARDENING APPOINTMENTS.**—Mr. BROOKS, Gardener to J. P. CROSS, Esq., has left that gentleman's place at Morthfield, Bolton, to take charge of the gardens at Colthorpe Towers, Rugby, also the property of Mr. CROSS.

RABY CASTLE, DURHAM.

(Continued from p. 646.)

LEAVING the Castle, and again passing through the porter's lodge—the keeper of which, by the way, is an old Guardsman of huge stature, intelligent, well versed in the history of the place, proud of the situation he holds, and as worthy an example of an English veteran as one could well meet with—in a north-westerly direction lies the garden; the space intervening slopes considerably for a short distance to a hollow, the garden occupying the gentle rise opposite, thus lying nicely to the sun, well sheltered from the north and east by the higher ground at the back. On the southern side of the garden, outside and continuous with the wall facing the park, there is a slip of ground some 250 yards in length; this wall is well stocked with healthy trees of Pears, Plums, and Apples, carrying nice crops; the borders occupied by their roots is planted ribbon-fashion, with the usual summer bedders, backed with Phloxes and Hollyhocks, not standing so near as to injure the fruit trees.

On the opposite side of the walk there is a wall supporting this slip, which is raised above the park adjoining; on the top of this wall there is an iron palisading planted with Clematis Jackmanni, in front of which at intervals are standard Roses—the whole, including the ribbon border, which is well planted, giving a very nice effect. Here also at the end of this border is the noted Raby Castle Fig, brought from Italy by one of the family 150 years ago. It is planted against the garden wall, occupying a house 18 yards long, and completely covering the wall the whole length of the house, and is trained down the rafters from back to front as well. It is a strong, healthy old tree, yearly bearing quantities of fruit. The entrance to the principal walled garden from this slip is at the opposite end to the Fig-house. The garden, I may here say, is irregular in shape; one of the good old-fashioned descriptions, combining the useful with the ornamental.

On the higher side to the north are a number of glasshouses, devoted to various purposes, which will be noticed hereafter. Fronting these there is a long broad walk leading from the entrance already mentioned to Mr. Westcott's house, which stands at a considerable distance, yet within the garden; right and left of this walk there is a moderately wide border filled with an immense quantity of flowering and fine-leaved plants, varied in their character and arrangement. Commencing at the entrance, the filling consists of the different varieties of bedding subjects, including Lobelias, Verbenas, Ageratum, variegated Alyssum, and Saponaria calabrica, sown late, so as to bloom in the autumn, at which time the place is required to be gayest. The border here is backed with a dense close line of Fuchsia Riccartoni. On the opposite side of the walk the planting is different, consisting of a good selection of herbaceous plants, amongst which are strong clumps of Tritoma uvaria. Further on, a space, irregular in shape, is filled with fine-leaved plants, green and variegated, such as Bamboos, Yuccas, Tobacco plant, coloured Beet, and a variety of similar things; still further on the arrangement is again varied, the border running parallel with the walk being laid out in half circles. Yellow, white, and purple Pansies are here freely used with good effect, associated with Tropæolum Hunteri, bronze and silver Pelargoniums, and Golden Gem Calceolaria, which here was very fine, and stands much better than *C. aurea floribunda*. Following the walk, the garden to the left is intersected by divisional walls and Vew hedges; the first of these divisions contains a combination consisting of Pentstemons, Gladioli, pink and white Anemone japonica and white Marguerites, grouped with summer bedders, having standard Roses at intervals to still further relieve the surface. Here is an assemblage of plants, such as even those who have the greatest dislike to the formality of bedding could see little to find fault with. To the back of this is a small Rose garden. On the border to the opposite side of the walk the filling in consists of Pelargoniums, Violet Hill, May Queen, and Christine, in circles set in Blue Bell Pansy, with yellow Fyretbrum back and front. In the next division, confined within the Vew hedges before mentioned, the arrangement differs; a large centre bed in grass has a Yucca for centre, surrounded with Veronica variegata pegged down, Verbena venosa, Ageratum Countess of Stair, Pelargoniums, Clematis Jackmanni pegged down, and

Blue Bell Pansy. Four large circles, occupying the corners of this grass space, are each filled with a specimen Cordyline australis encircled with Iresine Lindenii, Pelargoniums, Pansies, variegated Alyssum, &c. The continuation of border opposite is here arranged in chain fashion, the plants employed being Harrison's Musk, Lobelia speciosa, white-leaved Pelargoniums, and scarlet Tropæolums. The next of the divisions, which is fronting the conservatory, is laid out in geometrical beds round a large central one filled with succulents consisting of Yuccas, Agaves, Sempervivum, and Echeverias in a setting of Saxifragas and other things of like habit. There are here also four beds of Raby Carnation, a pale pink variety, a late bloomer flowering in succession; the remainder are filled with ordinary bedders. The beds in this division are in box, the paths gravelled with material from the lead works, which is of a nice yellow-brown shade, and keeps its colour well. To the left of the walk continuing up to Mr. Westcott's house the border is planted ribbon-fashion, with subjects giving enough, but not too much colour. The opposite side is occupied by a good selection of herbaceous plants, of which the best varieties of Phlox are a prominent feature, combined with Tritomas, Lupins, Aquilegias, and a host of others. The Phloxes are taken up every other year, and divided; in this way they bloom profusely in rich soil. I have thus gone somewhat into detail in describing the way that flower gardening is carried out at Raby, in which, by a judicious selection and arrangement of many plants widely different in their habit and general character, there is an absence of the monotony in form and glare in colour which is the objectionable feature in modern bedding. In place of the even balance in form and colour, the absence of which is often looked upon as a fault, there is no place in the whole length of this long walk where the opposite sides are exactly alike, and the same applies to the sectional portion of the garden divided in the way described, in each of which the planting is wholly different. The free use of good kinds of herbaceous plants prevents the ground at all seasons from having the bare appearance too often present, and independent of this there is always something in bloom from spring to late in autumn.

There is a large number of fruit and plant houses, a portion of which are in this garden. Fine-leaf plants have long been well grown here, the collection of these often holding the post of honour at the noted Lishop Auckland shows. Mr. Westcott is well known as a most successful fruit grower, Grapes, Pines, Peaches, Melons, and Figs, as well as the commoner kinds, being produced in a condition that only ability and unflinching attention can command. Beginning at the point nearest the entrance from the Castle, the first we come to are a couple of lean-to Peach-houses, each about 60 feet in length. The front border is sunk some 2½ feet below the level of the back path, with the trellis on which the trees are trained correspondingly lower than usual; in this way those with which the back wall is planted do not suffer from want of light. The Peaches are Barrington, Bellegarde, Noblesse, and Royal George, with Pitmaston and Newington Nectarines. *T. B.*

(To be continued.)

ELY COURT.

ELY COURT, the residence of J. H. Insole, Esq., is a modern building, having been erected by the present proprietor, who is one of those large colliery owners who have made names for themselves and found employment for thousands, and have converted the comparatively thinly populated vale of Glamorgan into a centre of trade and industry teeming with a dense population, which has, however, suffered during the last few years, in common with other districts, from the general stagnation of the coal and iron trades. One of the lodge entrances abuts upon the road from the Great Western Railway Station to the singular old city of Llandaff, which is in reality but a large village, with little of interest to the stranger except the cathedral itself, which stands on the site of the original "Church of the Taff" (from which the name Llandaff is derived), destroyed at the Conquest. A plain, but beautiful and substantial, restoration of the cathedral has been accomplished, which was rendered the more necessary from ill-directed efforts at restoration attempted in 1730, which had quite destroyed the character of the building.

Entering the grounds of Ely Court from the upper lodge, one is at once struck by the beautiful situation of the place, being on a rising ground gently sweeping up from the narrow alluvial plain lying between the rivers Taff and Ely. Sheltered by higher ground and excellent timber to the north, a beautiful view stretches out in front over the widening valley as the rivers reach the Channel, between the ports of Cardiff and her younger sister, Penarth; thence over the wide waters, dotted with a few islands distinctly visible, on to the Somersetshire coast beyond, just dimly seen, except when gleams of sunshine give sufficient light and shade to display the irregularities of its varied conformation. The constant movement on the water of numberless craft of all descriptions, from the largest of Atlantic steamers to the tiniest boat, the relief afforded by an expanse of perfectly level meadows immediately in front, and the bold undulating scenery crowned with luxuriant vegetation to the right and left, combine to form a picture harmonising as a whole, and beautiful in detail.

The mansion is a handsome Gothic building with a tower and observatory 85 feet high. On the west, or entrance front, is a spacious lawn, with fountain, &c., and bounded by banks planted with Rhododendrons, hardy Ericas and Azaleas, amongst which the growths are rapidly appearing of a varied collection of bulbs. Beyond this rises a very effective piece of rockwork which has been planned to hide a blank wall leading to the stables, and has been carried, partly by mounding and partly by large masses of natural rock brought from some distance, to a height of 30 feet. The planting has been effectively carried out, the intervening slopes of earth stretching from one mass of protruding strata to another have afforded accommodation for a considerable collection of rock and alpine plants. The conservatory is situated on the southern front of the house, and is effectively arranged with many nice specimen plants of Camellias, Palms, some good Tree Ferns, Dicksonia antarctica, *D. squarrosa*, and Clotium princeps, also large plants of the variegated forms of *Yucca aloifolia* and *Agave americana*. Amongst the Epacris, Epiphyllums, Hyacinths, &c., with which the house was gay were some particularly well grown specimens of Mignonette in the most robust health and covered with bloom, and the prettiest semi-double strain of *Fimula* we have seen. The flowers, which are either white or magenta, are of perfect form and substance, and have a small rosette of petals in the centre, suggestive of the double form of the Paper-white Narcissus. The roof is furnished with the usual climbers, which do not call for special comment.

A terrace in gravel and grass commands a view of the flower garden on the east front; the beds being furnished with shrubs and bedding plants for spring effect which are not particularly interesting in January. To the left of the flower garden a winding path is entered, with shrubby borders and rockwork which has been skilfully blended with its surroundings and hidden from the lawn; over fifty Camellias are here planted out, varying from 2 to 5 feet high, and, except where they receive the drip from trees, are the picture of health, and may possibly prove a success, as the position chosen is well sheltered. Winding paths amongst clumps and specimen trees and shrubs make the most of the limited extent of pleasure grounds, and lead amongst nice specimen Conifers, past collections of Rhododendrons, through a long trellis-covered walk, which must be beautiful in summer, with its covering of Roses and Clematis, and back through another Beech-covered way to the tennis-ground, surrounded by the herbaceous borders, which brings us to the bottom of the grounds, and to a recent addition to its extent taken from the park in front, and just converted into a rock garden with a small streamlet gradually widening to a pool at the lower end, where it is terminated by a rocky grotto some 30 yards long. The planting is not yet completed, but the general effect is already good; and being mounded and planted with shrubs, entirely hides the existence of such a garden from the carriage approach which passes this point. There is little doubt that it will be exceedingly effective when completed, and when the subjects planted have had time to become established; and it certainly does great credit to the artistic taste of the gardener, Mr. Julien, who has had to superintend the placing of every stone.

The kitchen garden is well stocked with choice fruits, the walls being furnished with the usual stone

fruits, looking very promising, and the borders being planted with all the leading sorts of Pears and Apples, trained in the various modes of pyramid, vase-shaped, espalier, and cordon, some of the trellises being carried to the height of 9 feet, covered with cordons which, we are informed, bear heavy crops each season. Roses are largely planted in this garden; and the vegetable crops show skilful cultivation, and testify to the mildness of the winter by their verdant hue. Here the principal houses are situated, and we commence by entering a stove full of the usual occupants of such structures, besides Ferns and a small collection of Orchids. Large plants of *Adiantum Farleyense*, *Eucharis amazonica*, *Cycas revoluta*, and several others seemed to be crowding their lesser and perhaps more useful neighbours; amongst which may be noticed nice table plants of some of the newer *Crotons* and *Dracenas*, whilst the old *Euphorbia splendens* and *jacquiniflora* were as bright and floriferous as usual. The next house entered is a span-roofed Cucumber-house, in which the plants have not done so well as usual this winter, but where, nevertheless, some useful fruits are hanging; only one side of the house is planted, the other being devoted to the propagation of bedding stuff, which has just commenced.

Following this is a house devoted to present to Fines, which were clean and healthy-looking. Crossing a portion of the kitchen garden an imposing block of cruciform shape, with lofty lantern-topped roof, is reached; the wings are devoted to late and early vineries, while the body is used as a greenhouse or intermediate plant house. The late vinery is planted with Lady Downe's, Muscat of Alexandria, Alicante, and Gros Colmar; of the latter many fine examples of large and perfectly coloured bunches remained hanging in the house, although it was filled with the store boxes, and pots of *Pelargoniums* for bedding out. Equally well finished examples of Lady Downe's were hanging in the fruit-room, showing that the house of Grapes must have been a fine one. On one of the stages in this house were equally good *Primulas* of the semi-double strain previously referred to. The central division, 42 feet by 24, was very gay with *Camellias*, the earliest *Azaleas*, *Orange trees* in fruit, *Epacris*, *Cinerarias*, and *Callas*; while a portion of staging devoted to a collection of succulents was interesting, and of climbers heavily laden with bloom may be mentioned *Clianthus puniceus* and *Acacia Kiceana*. The early vinery is planted with Black Hamburg and Foster's Seedling, not yet started, which present that robust promising appearance that Vines only three years planted ought to do. A long line of *Belladonna Lilies* were just breaking very strongly out of the ground in front of these houses, a position where they ought to prove very effective when in bloom.

Capacious pits in front of the stove, Melon, and Cucumber-houses provide commodious quarters for bedding stuff. An orchard-house was being turned to good account in forwarding Tea Roses, *Spiraeas*, &c., whilst its wonted occupants were plunged outside, and a similar use was being made of a cool-Teach-house 90 feet long, where bulbs were being brought on, and *Chrysanthemums* stored after blooming. The trees are trained to the back wall, and to a trellis in front, which only reaches half way up the rafter, and consequently only shades the border of the house, leaving the trees on the back wall fully exposed to the sun's influence.

With this rapid survey we conclude our account of a place where an endeavour is made to make the most of every inch of space, and most credit reflects upon the proprietor and his able gardener for the manner in which this is accomplished. R. C.

COFFEE IN CEYLON.—According to *The Colonies and India* hot weather has so prevailed in the Coffee districts of Ceylon that the prospect is favourable to good crops, though it now seems doubtful whether the estimate of 600,000 cwt. will be attained. The *Ceylon Observer* doubts if more than 550,000 cwt. will be shipped, and fears that there can be no improvement in the exports for the season 1882-83 unless the leaf disease disappears. Librarian Coffee, according to that journal, is doing exceedingly well, those plantations of it which are in bearing yielding satisfactory crops, the ripe berries being picked almost throughout the year. It is considered that the most sanguine anticipations formed as to the result of the cultivation of Librarian Coffee will be realised. As regards Tea, the estimated produce of which was put down as 500,000 lb., it is likely that the shipments will be nearer 1,000,000 lb., and that this will be doubled during the year 1882-3. The cultivation is extending with rapid strides.

HOME CORRESPONDENCE.

Funkias.—Among herbageous plants few, if any, will compare with these for beauty of foliage, which is strikingly handsome at all stages, for almost as soon as it appears it arrests attention by the peculiar way it is folded, and the rich delicate shades of green it presents. The most noble of all is *F. sieboldii*, which has grand leaves of a bluish metallic hue, and the plant forms a fine mass, and looks bold and commanding in any position. This variety does best among hardy Ferns, where it can have a little shade and plenty of moisture, and when so situated its foliage attains a very large size, and comes more glaucous and richer than it ever does in a border. Being fond of rich soil, the ground where it to be planted should be heavily manured and deeply dug so that its roots may get down and ramify freely. There is also a variegated form of this, which has its leaves margined with a creamy-yellow, and among the different kinds of *F. ovata* there are several, some of which are exceedingly beautiful. The most noteworthy and desirable are *F. ovata aurea variegata*, *F. ovata undulata aurea*, *F. ovata elegans*, *F. ovata sinensis marmorata*, *F. ovata glaucescens variegata*, and *F. ovata viridis univittata*. These are all worth growing, and some at least of them should be in every herbageous border, as, besides the highly ornamental character of their leaves, they all send up numerous spikes of fine Lily-like flowers, which are very showy-looking, and of great value for cutting, as they dress well, and last a long time in water. The season to divide and plant Funkias is in spring, just as they are starting, but as some nurserymen supply them in pots they may be got even now, and transplanted or turned out at once. J. Sheppard.

New Kinds of Potatos.—A short time since Mr. Kerr of Dumfries pointed out in these pages that not only had the Potatos *Crowwell* and *Ingliston Fluke* been offered in commerce in Scotland prior to season 1881-82, but also that his firm had previous to this same season offered in commerce the new American kinds *Queen of the Valley* and *Adirondack*. Waiving any further mention of the two first-named kinds, I wrote to Mr. Kerr, and asked him to favour me with his trade list of the previous year, showing conclusively that the kinds named had thus been offered as stated. Up to the present time no reply has come nor has any trade list. To prevent any such questions arising in the future, I would advise that the committee of the International Potato Exhibition, having regard to the facts that the exhibition is held in London, and that as moreover it is the headquarters of the horticultural press of the United Kingdom, I should insist that no new kind of Potato shall be regarded as having been offered in commerce, until it has been duly advertised as such, in the columns of at least two of the London gardening papers; that would-nosen constitute not merely an offer to a few in a remote locality, but a general offer to the public, which, if stock were plentiful, all might take advantage. A. D.

Lithospermum prostratum.—This is one of the most lovely hardy plants in existence, almost rivaling the *Gentianella* in the rich deep blue of its flowers, which are borne in the greatest profusion on prostrate creeping stems, which on old plants spread themselves out some 2 or 3 feet round, and quite carpet the ground. As a rock plant *Lithospermum prostratum* is quite unsurpassed, as it is specially adapted for growing on elevated positions where it can trail over, and when so cultivated it shows off its graceful habit and beauties to the greatest advantage. The soil it likes best is that which is sharp and gritty, such as the turfy parings from roadsides or peat and sand, in either of which it does well and roots freely if layered. Cuttings put in on a shady border under handlights strike readily if inserted any time after the young shoots get a little firm, but to encourage them to do this they must be kept close, and the atmosphere around them moist by occasionally sprinkling them over. J. S.

Cleaning Boilers.—Common saddle boilers are seldom fitted with cleaning plugs, though most of the better class of "improved" ones are; it is merely a question of price, as the cost of inserting two 2-inch screw-plugs in a wrought-iron boiler when first ordered is only a few shillings; but to drill and fit these after all is fixed, and especially in a cast boiler, the expense would be trebled. The 2-inch hole noted by "J. R. H." is only for the purpose of drawing over the water—not for cleaning out the mud. No doubt

some boilers are rendered inefficient by the filthy water used, but there is little excuse for this, because the trouble of roughly filtering the water when the apparatus is first filled would be very slight, and once done there is no further risk unless the water is drawn off in considerable quantities and allowed to be replaced from an open cistern, into which all sorts of dirt finds its way. The actual waste of water in a large apparatus need not be more than a quart a week if properly arranged. A piece of old calico stretched loosely over the supply cistern will allow the water to pass slowly through while filling it, and to become sufficiently pure for heating purposes. Many boilers are covered with a thick deposit even when clear pipe water is used, but it is incrustation caused by boiling the hard water continually. I have seen one so crusted over as to be useless in three years, and another fed from a pond for twelve years which did not require cleaning all the time. Unless there is a sufficient quantity of mud accumulated to stop the return inlets of boiler the deposit will not do much harm at the bottom sides of a saddle; if there were tubes there or waterway fire-bars they would probably choke up and then break. If there is a "return" on each side of the boiler close to the bottom it may be less trouble to pick out and disconnect the joints of the elbows there, and so clean out that way for once than it will be to clean out the whole of the boiler, and to take it for new plugs, but the latter, once in, are always available. B. W. W.

I think it is possible that "J. R. H." (see p. 643) may find on examination that his return pipes require cleaning out more than his boiler. The fire has generally the effect of driving all sedimentary matter out of the boiler and flow pipes, to be deposited as the circulation becomes more languid in the return pipes, and these, from the condition of the water he appears to have used for the purpose of filling his boiler and pipes, I should expect to find more than half filled with a deposit of mud, over which a small portion of water will continue to flow, until such time as the deposit increases to such an extent as to seriously interfere with the circulation of the water. I hardly understand why "J. R. H." should have used such water as he describes, to have filled his boiler and pipes, or why he should require the continued supply he appears to do, as if there is no leakage, and if the lid of the expansion cistern fits closely, it is thought to do, the water in water should hardly exceed a gallon in a month. Clean rain-water should always be used for the purpose of filling boilers and hot-water pipes. Hard water is objectionable, as it mostly forms a chalky deposit inside the boiler and pipes, which might in time to some extent retard the radiation of heat; but whether hard or soft water be used for the purpose it may not be of much importance, but it certainly ought to be clean. P. Grive.

Mulching Strawberries.—Mulching is both necessary and beneficial at this period of the year; necessary to ensure the cleanliness of the fruit, and beneficial in that it prevents the evaporation of moisture at the root in dry seasons. It also assists in keeping down weeds. Long stable litter is the best material; it washes perfectly clean with the first rain, and the fruit soon becomes dry. Grass or hay imparts a disagreeable flavour to the fruit, though it is more easily applied and obtained in many gardens. The vinery mulching. I always do the heels of the plants, underneath the foliage, and the whole of the ground, with finely sifted air-slaked lime; this prevents and destroys slugs until the season is past. Mice, which are very destructive to this crop, are trapped with figures-of-fours, which any garden labourer can make out of a few laths of deal, and which are therefore inexpensive, quickly and easily set. D. C. P.

Wistaria sinensis.—At Llechryd, near Cardigan, I saw last week a *Wistaria*, which, if not extending its branches so far as those mentioned by your correspondent, is perhaps worthy of notice. It was planted near the centre of the east side of the house (J. W. Stephens, Esq.), and branched either way, meeting at the back, completely encircling the house, i.e., in one direction, 57½ feet—the other 50 feet; but not one branch merely, but by so many as to cover the whole surface of the upper storey. When viewed the pleasure of seeing it the south end was in full bloom, and being by the roadside it is much admired. F. G.

Hemerocallis.—The *Hemerocallis* or Day Lilies are fine border flowers, of bold type and habit, the stronger varieties, such as *H. fulva* and *H. Kwanso*, being so much coarser than the others, being specially adapted for semi-wild places, where, if they can have moisture and room, they look quite at home, and are so hardy and vigorous as to be quite able to take care of themselves. The variegated forms of these would be trebled. The 2-inch hole noted by "J. R. H." is only for the purpose of drawing over the water—not for cleaning out the mud. No doubt

well known *Pandanus Veitchii*, which at first sight it somewhat resembles. *II. fulva variegata* is nearly as good, and they are both quite well growing in pots for slight forcing to get them in early for the embellishment of greenhouses or conservatories, where they stand well, and make quite a show. The most valuable, however, for that kind of work is *H. lutea*, which grows about 2 feet high, and produces umbrella-like heads of rich yellow flowers. They are as large as an ordinary size *Amarellis*, and being of a colour so scarce and of such a bright shade, plants in bloom make a fine display among others. We grow ours up in the borders or any odd spare places, and take them up in the winter, after which they are stood in frames and slowly brought on as required. Like most herbaceous plants they are fond of good soil, which should be light and open, and if they are watered now and then during the summer, they develop strong crowns, and flower with the greatest of freedom. *J. S.*

Early Tulips.—Your correspondent, writing on early Tulips, at p. 602, names *La Belle Alliance* as the best scarlet or crimson self. I have this variety growing beside *Vermilion Brilliant*, which is far superior to *La Belle Alliance* as a bedding variety; the flower is much larger and more effective. It is after the style of *Van der Neer*. The tips of the petals are slightly streaked with white; some might object to it because of this. I find that *Chrysolora* is better than *Yellow Prince* for bedding; the flowers are larger and more telling. *Vermilion Brilliant* and *Chrysolora* flower at the same time and would bed well together. Of variegated Tulips *Couleur Ponceau* promises to be a very fine variety, but it is not yet in bloom. Considering the rich effect Tulips have for bedding, their season of flowering, and the cheap rate at which they can be purchased, the wonder is that they are not more extensively planted. *J. S.*

Stephanotis floribunda.—The most floriferous example of this universally admired stove climber that I have ever seen I saw at the residence of Mr. E. K. Wootton, the residence of Frederick H. Gossage, Esq. It may be stated that the plant is extremely vigorous, is planted at one end of the stove in which it grows, and has a run of about 60 feet. The foliage and the numerous branches which clothe the plant from the base to its farthest extremity, all testify to the robust health it is in. The main branches are divided when they reach the roof, and are carried along from end to end of the house longitudinally, each wire being about 16 inches apart, thus securing ample light for all their occupants growing underneath. But the most remarkable feature of the plant was the unbroken masses of flowers which sprung from every joint from end to end of each festoon. Individually the flowers are large, a considerable proportion of them being characterised by six segments to the corolla, while the trusses also are large, and contain an average of eight to ten pins in each. It has been in bloom since February more or less, but is now at its best, and a sight worth seeing. It ranks the highest credit on Mr. Jellie's management and skill, as everything else does at *Campbell, W. Sutherland*.

Dinner-table Decoration.—That floral decorating, or, as it is called in the metropolis, furnishing, is growing in importance every year, no one, it may be presumed, will attempt to deny. Although it cannot—or at all events does not—rank as a high art, it certainly is fast leading up to that which in the opinion of some persons would justly give it a claim to such a dignified term. Every year we see something fresh, and each year brings with it some slight improvement in some shape or form on its immediate predecessor, and that it will continue its onward march in the path of progress—slowly it may be yet surely—is a question which is beyond all doubt. In itself it is obviously a luxury in the strict sense of the word, and one which resolves itself into a question simply of supply and demand. Taking this fact as our starting point we may safely assert that with our annually increasing wealth so there will be an increasing low corresponding demand for something in the future—and as a matter of course more costly—in the way of floral decorating than that which has been accomplished in the past. To many the idea of writing or talking about improvements on existing modes of decorating will doubtless seem to be not a little absurd, and the accomplishing of anything superior to what we now see is regarded as an impossibility; so also it may be retorted would a dinner-table decorated *à la* Versailles have been regarded in the same way half a century ago by our great-grandfathers? What will be done in the way of decorating in the future no one can say; if, however, the rate of progress is anything like proportionate to what it has been in the past—and it is only reasonable to suppose that it will be—who is there who dares to say that he does not lose himself in vague conjecture if he tries to imagine what a well decorated table will be like fifty years hence? Where high-class floral decorations are a *sine qua*

non the resources to cope with the same must of necessity be on a large scale, the labour also attaching to it must be of a skilled order; indeed, in many large private establishments it is found quite necessary to employ special persons for this kind of work, those of the taste and skill in the art. The amount of glass and other sundry matters connected with the growing and supplying of suitable subjects for the decorator, together with the cost of plants themselves, need not be entered into here; suffice it to say that it is the same with this as with most other things, and if the highest standard of excellency is required the longest purse, so to speak, will invariably secure it. It must not for a moment be supposed from the preceding remarks that the writer clings to the idea that no prettily effective, and telling floral combination can be obtained other than those which are the most costly. Many very effective and pleasing devices and arrangements may be produced by taste and skill, with the very commonest of wild flowers, Ferns, grasses, and leaves, so also they may be with many more occupants of our hardy herbaceous and shrubby borders. But notwithstanding this, it must be acknowledged, that the most chaste, beautiful and gorgeous decorations are those in which the best tropical plants predominate. No display of our common hardy flowers, no matter how skilfully arranged, can bear favourable comparison with an arrangement or display consisting wholly of tropical plants, such as Orchids, Palms, Ferns, and many other different genera and species of plants, which in our climate require glasshouses to grow them in. We will now enter a little more closely into the subject, and note a few of the practical points connected therewith. In the first place the best decorated tables are those on which not only tropical plants, flowers and leaves, are used, but fruit also, and this in some cases in a growing state, Grapes and Strawberries for example. To explain my meaning more clearly, I must ask the reader to draw a little on his faculties of imagination, and to assist in decorating a table in writing, so to speak, as follows: The table may be of an indefinite length, and large enough to line any number of persons from twenty to a hundred. From the ends, and with a group of plants arranged in a pyramidal form, a circular board 2 feet in diameter; the tallest plant must be from 2 to 3 feet high, any of the following being admirably adapted for the purpose—*Aralia Veitchii*, *Cocos Weddelliana*, *Draecena Cooperi*, or any of the other bright coloured and graceful leaved varieties, and *Pandanus Veitchii*; the other plants forming the group may consist of such as have ornamental foliage; finish off with a row of Fern fronds placed round the edge of the board so as to hide the same, and to drop over on to the cloth. It may be as well to remark that the majority of plants used in this way will have to be turned out of the pots, otherwise it will be difficult to arrange a sufficient quantity of plants on each board; the soil and roots should also be hidden from view with common moss, and be faced over with *Selaginella Kraussiana*. At a distance of 6 feet on either side of the centre group others must be placed, and made up principally of flowering plants and *Maidenhair Ferns*, if of medium small pots are contained so much the better—use only those, however, which when in flower have a chaste and graceful appearance, such, for instance, as many of the *Odontoglossums*, *Phalenopsis*, *Acridies*, *Coleogyne*, *Cypripediums*, and other still erect flowering kinds should be avoided; if such delicately tinted kinds as *O. Alexandrae*, the lighter varieties of *P. Schilleriana*, or *Coleogyne cristata* are used, a couple of small plants in each group of *Anthurium Andreanum*, or *A. Schottianum*, with each having two or three of their bright coloured spathes would heighten the effect considerably. Other groups of flowering and foliage, corresponding as nearly as possible with the above, should be placed in a line, 6 feet from each other down the middle of the table; half way between the groups, and about a foot outside of the centre line of the same, small eperges of cut flowers should be arranged in pairs, one on each side. Along the whole length and width of the table a row of Strawberry plants from 4-inch pots, each bearing put into a small vase, and bearing from six to ten ripe fruits on each, should be placed at a reasonable distance from each other; these, with their bright coloured fruit overhanging the sides of the vases, have a charming effect. Nothing further than the above is needed, with the exception of a few plants of *Selaginella Kraussiana aurea* dotted about here and there, which must be divested of every particle of soil and be placed on the cloth on small pieces of stiff brown paper. It may also be well to give a word of advice to those who are engaged in such a plan, that if such plants as have been named are used, a few neat stakes and ties here and there will be necessary to give the requisite form to the whole. Pot Vines are exceedingly useful for decoration, and may be employed in a variety of ways, but when grown for table work the canes should always be run through a 6 or 8 inch pot, which should rest on the top of the fruiting pot, and be filled with soil previous to starting into growth. By

this means they become, when the fruit is ripe and the small pots severed from the large ones, very serviceable either for the dinner-table or sideboard. They may be trained in the spiral form, or may be grown so as to form arches between the groups of plants; when used in this way they leave little or nothing to be desired. *F. Horsfield, Heytesbury.*

Late Frosts.—We have had several sharp frosts during the last week, and this morning it has cut the Frost down quite black in places. The wind is still north-east and very cold. The fruit crop is all right at present. *G. Merritt, Kington Hoo Gardens, Woburn, May 17.*

Hardy Flowers adapted to Town Gardens.—Very few good hardy border flowers are to be met with in town gardens as a rule. Probably the selection of unsuitable sorts, which quickly die out, leaving only the remembrance of failure, is the principal cause of the rare appearance of any except the most robust of this class of hardy flowers in neighbourhoods where smoke and other pollutions of the air abound. Perhaps a more judicious selection of sorts, and varieties having some pretensions to beauty and good constitution, and our efforts to resist the effects of smut and foul air would lead to their more general adoption in the class of gardens alluded to, and the improvement of taste in them. That such a selection may be made if sought after, may be judged of by the following list, which was noted in the Botanical Gardens, Liverpool, in the second week of the present month. These gardens may be regarded as the best test-ground in the kingdom for smoke-resisting plants;—on three sides the breadth of the roadway only intervenes between them, and the railways, with their huge engine sheds, chemical and other manufactories, and the vast extent of the city, with its thousands of chimneys spreading out in every direction and combining to produce as foul an atmosphere as can well be imagined; and as if to aggravate the evils of the position, the prevalent winds blow direct on the gardens over the greatest length and breadth of the city, leaving their smutty deposits everywhere. The only spaces and openings are on the majority of the hardy plants, particularly on the trees and shrubs; it may, therefore, be safely inferred that any plant which is found to succeed here will thrive in any similar atmosphere. I have some confidence, therefore, in recommending the plants named below to those of your readers who may have gardens to decorate in smoky parts: all were in full flower when they were noted:—

<i>Aquilegia Vitmanni</i>	<i>Orobolus canescens</i>
<i>Aubrietia Mooreana</i>	“ <i>repens</i>
<i>Armeria plantaginifolia</i>	<i>Phlox maculosa</i>
“ <i>valisaria</i>	“ <i>verna</i>
<i>Baptisia lutea</i>	<i>Potentilla alba</i>
<i>Cardamine asarifolia</i>	<i>Ranunculus repens fl.-pl.</i>
“ <i>pratensis fl.-pl.</i>	“ <i>Gouan</i>
<i>Campanula glomerata</i>	“ <i>uniflora</i>
<i>Delyria eximia</i>	“ <i>hectori fl.-pl.</i>
<i>Desmodium hybridum multi-</i>	<i>Saxifraga oppositifolia</i>
“ <i>floribus</i>	“ <i>spathulata</i>
<i>Dodecatheon giganteum</i>	“ <i>platyphylla</i>
<i>Geranium acutifolium</i>	“ <i>rotundifolia</i>
<i>Erys. coriaria</i>	“ <i>granibata</i>
“ <i>sempervivens</i>	<i>Silene maritima fl.-pl.</i>
“ <i>tenoreana</i>	<i>Scilla vesica</i>
“ <i>suecica</i>	<i>Stellaria Holstea</i>
“ <i>linifolia</i>	<i>Tulipa perna</i>
“ <i>saxatilis</i>	<i>Trollius asiaticus</i>
<i>Iris pumila</i>	“ <i>alpestris</i>
“ <i>germanica</i>	<i>Uvularia puberula</i>

H. S.

Tsuga Pattoniana.—In your issue of March 25, p. 400, you query whether the cones of the *Tsuga Pattoniana* are erect. I have never seen the very young cones, but long before they are mature they are certainly pendent, resembling in this respect the cones of *T. Mertensiana* and *T. canadensis*. The specimens of *Abies grandis* noted by Dr. Engelmann and those shown by Messrs. Veitch are from the same very local locality, possibly from the same tree. They correspond in all essential characteristics to specimens from all parts of Oregon. *E. H. Collier, Eugene City, Oregon.*

New Melons.—Messrs Dickson, Brown & Tait had doubtless found out “Best of All” to be a good Melon, or they would not have stated its merits so confidently in their advertisements of it. Mr. Tait may rest assured that I would not have made the statement if I did without good grounds. First, let me say, that “Best of All” is of fair flavour, and a remarkably free grower and setter, one plant having seven good fruit on it. What I maintain is—and I know I have with me Mr. Fish and Mr. Lumsden—that it is not equal in flavour to William Tillyer and Dickson's *Exquisite*, which have been distributed now for four years, and either of which may well be taken as a criterion. No Certificate has been awarded to it by the Royal Horticultural Society, and one occasion when exhibited before it the report in the *Gardener's Chronicle* was the opposite of complimentary. My

own experience, both in June and November, taken with this report and the opinions of the above-mentioned gardeners, caused me to give an unqualified opinion. How often have judges declared such and such Melon to be "the best they ever tasted?" The expression is hackneyed. As Mr. Ruskin says about a severe thunderstorm, which the crowd "shout together" to be the most awful they ever saw, "because they compare it, not with the thunderstorm of last year, but with their own faded recollection of it." If it was the best Melon the judges (four better ones it would be hard to find) ever tasted, why did it not beat, or, perhaps (if I know not which is the case), why was it not shown against, a rival of nearly the same coloured flesh—Héro of Lockinge—which Messrs. Sutton may well be proud of distributing? *H. Carmichael.*

Fruit Prospects in Staffordshire.—Fruit trees of all kinds promise well, except Pears on walls, which are a thin crop, while standards and pyramids promise well, being a blaze of beauty. Plums have been one mass of bloom; on walls, dessert varieties have set well, and, we may safely say, are past all danger. Cherries have been a sight worth going a long way; they have set a wonderful crop and are swelling fast. Apples are everywhere showing well, and we may look forward, if the weather proves favourable, for an abundant crop of this esteemed fruit. Apricots are better with us than they have been for years past, having a full crop of healthy fruit. Peaches and Nectarines are thin, the trees having suffered from the past severe winters. Small fruits of all kinds promise well. Strawberries will soon be in full bloom, and are strong and healthy. *E. Gilman, Ingestre Gardens.*

Reports of Societies.

Royal Botanic: May 17.—The first summer show, held on Wednesday, was an unqualified success. The large marquee was filled to overflowing; Mr. Coomber's grouping left nothing to be desired, and the weather was as it should be for a flower show—bright and fine. It is seldom at a first summer show that such a number of good plants, "in to the day," are brought together, and it is a question if a brighter or better display will be seen in the metropolis this season, as most of the subjects seen here will have to go the rounds, and cannot improve in the process. The stove and greenhouse flowering plants were a capital lot. For instance, open to amateur, Mr. Tudgay, gr. to J. F. Grosvenor Williams, Esq., Henwick Grange, Worcester, came in 1st, his finest examples being of Erica Cavendishiana, E. ventricosa magna, Clerodendron Balfourianum, Franciscana confertiflora, Azalea magnifica, A. Criterion, and Dracopis hillii gracile, all large and thoroughly well bloomed; Mr. Chapman, gr. to J. Spode, Esq., Hawksley Park, Kugeley, was 2d, with, amongst others, a fine Darwinia tulipifera, Isora Dixiana, Erica depressa major, Aphelandra macrantha, &c.; Mr. C. Rann, gr. to J. Warren, Esq., Handrove Park, was 3d. For 1st, Mr. Chapman was placed 1st, Mr. Tudgay 2d, and Mr. J. Child, gr. to Mrs. Torr, Grandbaird Hill, Ewell, 3d. In the nurserymen's class for twelve Mr. Cypher, of Cheltenham, a new exhibitor here, came in 1st, with a very good collection, including Stephanotis floribunda, some large Heaths, Andros, &c., all well-flowered. Messrs. Jackson & Son, Kingston, were a good 2d, most conspicuous in their group being a large, well-flowered plant of Rhododendron Dalhousiae, which is not often seen. Messrs. B. Peed & Son, Northury Nursery, Streatham, were 3d. The best-named specimen of the late Mr. Cypher was 1st. The fine-foliaged plants were exceedingly good all round. Mr. C. Rann took the lead amongst amateurs with a superb group of six, composed of a noble plant of Erica sapida, a large Latania borbonica, a large Croton Hendersonii, a magnificent specimen of Croton intermedium, about 7 feet through and perfect in foliage, and a very good Gleichenia Mendelii. Mr. Tudgay was a good 2d, with his large Latania borbonica, and very fine plants of Cycas cirinalis and Croton Andreanus, &c. Mr. G. Wheeler came in 3d, and Mr. Butler, gr. to W. F. Gibbs, Esq., Regent's Park, was represented by an extra prize. The trade class for the same number brought Mr. James Cypher to the front with a remarkably handsome Latania borbonica, and large well finished examples of Croton majesticus, C. Jamesi, and Gleichenia Mendelii. The Orchid class, at James's Nursery, Lower Norwood, coming in 2d, and Messrs. Hooper & Co., Covent Garden, 3d. The Fern classes call for little comment, large plants not being the rule. Mr. Douglas took the lead amongst amateurs, Mr. G. Wheeler being a good 2d. The Orchid bank, as usual, presented a very gay appearance, and introduced one or two new competitors. The nurserymen's class was the weakest, and for the first time in about thirty years our old friend, Mr. B. S. Williams, was not represented. The 1st prize in the amateur class

was taken by Mr. C. Coningsby, gr. to C. Dormer, Esq., The Firs, Sydenham, who had a superb mass of small-toglossum vexillarium, about a foot through, and smaller, but nice examples of Dendrobium Falconeri, Oncidium concolor, Cattleya Mendelii, Odontoglossum Halli leucoglossum, Aln-devalia Haryana, &c.; 2d, Mr. H. J. Noble, gr. to a large and well-flowered Dendrobium nobiliss, Cypripedium villosum, C. caudatum roseum, Dendrobium Wardianum, &c. 3d, Mr. A. G. Cutt, gr. to W. Cobb, Esq., Sydenham, with Thunia Marshallii, Vanilla suavis Veitchii, Oncidium concolor, Odontoglossum citrosimum. With a very neat collection Mr. H. James, Esq., Ladbroke, had a most interesting group, amongst other well bloomed specimens of Cypripedium novitii, C. barbatum, Odontoglossum citrosimum, Oncidium Marshallianum, Masdevallia Lindenii, &c. Messrs. Jackson & Son, Kingston, were 2d, having Odontoglossum carolinense, Lepa purpurata, Succisa guttatum, Vanilla suavis, &c. For nine specimen Roses Messrs. Grand & Son, Cheshunt, had the field to themselves, taking the 1st prize with a grand lot of plants, among them being one of the very finest Charles Lawsons ever seen, being over 8 feet through and superbly bloomed, and another well bloomed example of Madame Victor Verder, Perfection de Monplaisir, Madame de St. Joseph, superb; Anna Alexiis, Cheshunt Hybrid, and Marquise de Castellane. For twenty small plants the Messrs. Paul were beaten by Mr. Turner, whose examples, including the larger, were in this respect, in this respect, being indeed very fine. Azaleas as a rule are not so full of flower this season as usual, but those shown here were of fair average quality, and made a bright display. There were no particularly new sorts among them, so we need not name them, the leading prize winners were Mr. Ratty, Mr. Chubb, Mr. Turner, and Messrs. Jackson & Son. The specimen Heaths seem, if anything, to be getting smaller, medium sized plants only being the rule to-day.

The Pelargonium classes were also below the mark, and call for no comment. Mr. Wiggins, gr. to H. Little, was 1st, amongst amateurs, and Mr. Cypher 1st among nurserymen, the latter being lucky in having his plants judged superior to a smaller but much more highly finished lot from Mr. Turner. Miscellaneous collections and groups of new and rare plants were both numerous and good. Messrs. G. Jackson & Son, Woking, contributed the most remarkable group of Clematis that have yet been seen, the specimens being larger and the individual flowers much finer than they have ever before produced. The leading varieties were Blue Gem, Robert Hanbury, Sensation, Madame Van Houste, Mrs. G. Jackson, of Purpurea elegans, Lady C. Neville, Contesse of Lovelace, Henryi limosa, and Prince of Wales. Another group, showing excellent cultivation, but which, being smaller, suffered somewhat by comparison, came from Messrs. Richard Smith & Co., of Worcester, whose best flowers were on plants in Grand Duchesse Lawsoniana, Verschaffeltii, Impatrice Eugenie, Sensation, Gloire de St. Julien, and Lord Neville. Large and very effective groups of flowering and fine-foliaged stove and greenhouse plants, including a number of novelties, came from Mr. E. S. Williams and Messrs. John Laing & Co.; and Messrs. James Veitch & Sons had a very fine group of Japanese Acer, alongside of them being another group, equal in size, of pop Rosess, half-specimens, and admirably good from Messrs. Paul & Son, Waltham Cross. Messrs. James Carter and Co. had an interesting group of small alpine and hardy herbaceous plants; and Mr. Golder, gr. to H. Lea, Esq., Montague Grove, Hampstead, sent half-a-dozen beautifully grown specimens of Adiantum cuneatum, &c. Mr. Waltham Cross had some nice cut Roses, &c., and Mr. Hooper, of Bath, had an extensive display of Pansies, Tulips, and other florists' flowers, in the cultivation of which he is known to be an adept. Many new plants came under the notice of the judges, and the following awards were made:—

- Botanical Certificates.*
- To Mr. B. S. Williams, for Kentia costata.
- To Mr. E. S. Williams, for Pellaea Domiana.
- To Mr. B. S. Williams, for Croton Bar Schneider.
- To Mr. B. S. Williams, for Phalangium elegantissimum.
- To Mr. B. S. Williams, for Agapanthus umbellatus aureus.
- To Mr. B. S. Williams, for Reseda odorata prolifera alba.
- To Mr. B. S. Williams, for Adiantum dolabrifolium.
- To Mr. E. S. Williams, for Pescatorea Klachoborum.
- To Messrs. James Veitch & Sons, for Pratu angulata.
- To Messrs. James Veitch & Sons, for Acer polymorphum decompositum.
- To Messrs. James Veitch & Sons, for Acer polymorphum linearifolium.
- To Messrs. James Veitch & Sons, for Acer polymorphum ribesifolium.
- To Messrs. James Veitch & Sons, for Acer cratægifolium.
- To Messrs. James Veitch & Sons, for Acer japonicum aureum.
- To C. Dormer, Esq., for Trichopilia Backhousiana.
- To M. Vervae, Ghent, for Pescatorea Lehmannii.
- To Messrs. Paul & Son, for Corylus aurea.
- To Messrs. Kewley & Son, for Scolopendrium vulgare densum.

- Floral Certificates.*
- To Messrs. John Laing & Co., for Caladium album lotum.
- To Messrs. John Laing & Co., for Caladium This Rose.

- To Messrs. John Laing & Co., for Begonia Wm. Beaily.
- To Messrs. John Laing & Co., for Begonia Arthur G. Somes.
- To Messrs. John Laing & Co., for Begonia Marquis of Bute.
- To Messrs. Wm. Paul & Son, for H.P. Rose Queen of Heaths.
- To Mr. Balchin, for Reseda odorata prolifera.
- To Mr. Hooper, for Pansy Eclipse.
- To Mr. Hooper, for Pansy General Garfield.
- To Mr. Knapley, for Calceolaria Claret of Gold.

Torquay Horticultural: May 15.—The Devon County Agricultural Society having this season selected Torquay as the site for its annual show, advantage was taken of the circumstance by the Torquay Horticultural Society to hold a large flower show in connection with it, and a huge tent, 300 by 40 feet, was erected in one part of the show ground. Here a large quantity of things were somewhat roughly and irregularly staged, a good portion of the central staging being quite empty. There were some very fine stove and greenhouse flowering and foliage plants present, and if these had been grouped in the centre in an effective manner, leaving the ends to be filled up with such collections of plants as could have been utilised for this purpose, the effect would have been much more satisfactory. The class for eight stove and greenhouse plants in flower brought together some superb plants. J. Lawless, Esq., Exeter (Mr. G. Cole, 2d), was far away 1st, with plants of very high-class quality, consisting of foreoresis varium Chandleri, Erica tricolor Wilson, Anthurium Scherzerianum, Aphelexis macrantha purpurea, and A. macrantha rosea, Erica affinis, Clerodendron Balfourii, and Azalea Rubens, a very fine, clean, healthy, fresh, admirably grown lot. 2d, Mr. H. Amory, Esq., Bath. The class for six plants the specimens were considerably inferior, the best coming from Colonel Glossop (Mr. John Sterly, gr.), and John Luscombe, Esq. (Mr. J. Dane, gr.). Large-flowering Pelargoniums were scarce, and poor in quality; plants were plentiful, and better as flowering plants; Calceolarias small, but good. Some special prizes for tuberous-rooted Begonias brought some very nice plants, well grown and flowered. Roses in pots were poor, and unworthy of a company supposed to be favourable to their production. Groups of plants arranged in groups were numerous, there being three classes for them. In the nurserymen's class Messrs. Curtis, Sandford & Co., Rose Nurseries, Torquay, were 1st, with a good representative group of ordinary nursery stock, clean, well grown and bloomed, and arranged with taste, though a little flat, this was characteristic of all. 2d, Mr. W. Burridge, nurseryman, Paignton, a very bright group, flatly arranged, and in need of foliage to tone down too much of floral glare. 3d, Mr. W. B. Smales, nurseryman, Torquay. In the open class decidedly the best group came from Mr. G. Lock, and here were good plants arranged with taste, and with less of the fitness complained of; 2d, Mr. W. Selway, with a very nice group, a little overdone with specimen Azaleas; 3d, Mr. J. Dane, with a bright group of effective groups. In the other class appeared nothing calling for comment.

The class for eight stove and greenhouse foliage plants brought a fine competition. Here Mr. Lock was 1st, with an even well-balanced lot of plants in good condition; 2d, Mr. G. Cole; 3d, Mr. G. Selway. In the class for nine exotic plants, the 1st was shared by the miscellaneous groups shown by nurserymen were a leading and excellent feature. Foremost was a large extent of plants from Messrs. Lucombe, Pince & Co., of the Exeter Nurseries; Messrs. K. Veitch & Son, Exeter, had an admirably good group also. Messrs. Curtis, Sandford & Co., and H. Phillips & Co. also staged nice decorative groups. Captain Hildford Thompson, Clarendon, had a good collection of fancy Pansies in pots, of an excellent strain, and cut blooms of the same, and Mr. G. W. Eschey, Fluder, Kingswearwell, had a collection of cut blooms of bedding Pansies and Violas.

Meteorological.—The usual monthly meeting of this Society was held on Wednesday last, at the Institution of Civil Engineers, Mr. J. K. Loughton, F.R.A.S., President in the chair. The following papers were read:—"On the Diurnal Variation of the Wind and on its Relation to Isobaric Lines," by the Hon. Ralph Abercromby, F.R.S. By constructing synoptic charts at different hours of the same day, and by comparing the wind and weather records at the different hours, and examining their relation to mean curves of atmospheric variation, the author shows that the mean diurnal increase of the wind's velocity is explained by the fact that for the same gradient there is more wind by day than there is by night. The mean diurnal veering of the wind is explained by the fact that at night the wind is a little more incurved, and in anticyclones a little more curved, by night than by day. The mean diurnal increase of the frequency of rain during the day hours is explained by the fact that in any given cyclone the area of rain is larger by day than at night. The diurnal changes of every element are supposed to be due to general changes, and are independent of each other. Great stress is laid on this point, both as explaining and classifying many meteorological questions, and as simplifying the problem of the forecasting. The author gives a simple hypothesis, from which it appears that a diurnal veering and increase of rain follow as a natural consequence of the diurnal increase of velocity.—"Mechanical Conditions of Storms, Hurricanes, and Cyclones," by W. F. Stanley, F.M.S.

Foreign Correspondence.

CEDRARS OF LEBANON AT GENEVA.—We have at Geneva two magnificent specimens of this fine tree, which are contemporary with those in the Jardin des Plantes recently mentioned in your columns, and which were planted at Beaulieu, near Geneva, by Jussieu himself. The two trees in question are, for what reason I do not know, much handsomer than the one in Paris—so much so that when I first saw the latter I doubted whether it could have been planted at the same time as those in Geneva. It was, indeed, explained to me that there had been some earthworks which had concealed a large part of the trunk. The lower branches of our Cedar trail on the ground, and give the tree a magnificent appearance. Travellers who have seen the Cedars on Lebanon assure me that the Geneva specimens compare favourably with the native specimens. I am indebted to M. Chauvet, the present possessor of Beaulieu, for the following particulars:—"Bernard de Jussieu brought seed from England in 1735, and from this were derived the Cedar in the garden at Paris, the two at Beaulieu, and another at Montigny (Seine et Oise)." The Cedar is so thoroughly established at Geneva that it may be seen in almost every garden. Among them are some fine specimens. M. Meyer possesses one, the seeds of which germinate on all sides, so that M. Meyer showed me recently young plants along the roadside in the cracks of the wall and the garden paths. We may therefore consider the Cedar as quite established in this part of Switzerland. *T. & S. Corvecon.*

[We presume this is the tree spoken of by M. Alphonse de Candolle as being so much at home that, were it not for the scythe of the mower or other untoward circumstances, the tree would form forests by the shores of Lake Leman. Of the Cedars in the Chelsea garden only a wreck of one remains. Miller says in his time (1766) there were four which were planted in 1683 when about 2 feet high. The trunks had, when Miller wrote, a girth of 12 feet and upwards at 2 feet from the ground, and their branches extended 20 feet on each side of the stem. ED.]

- 13.—A very fine bright warm day, sun shining brightly, blue sky. Fine clear cold night, cool breeze.
- 14.—Fine day, deep blue sky. Dark sky, cold N.E. wind at night.
- 15.—A fine bright day, cold N.E. wind, overcast at intervals. Fine clear cold night.
- 16.—A very fine day; overcast from 2 P.M. till 3 P.M.; afterwards fine and bright. Fine clear night.
- 17.—A partial eclipse of the sun. A fine bright warm day, sun shining brightly. Fine clear night.

LONDON : Atmospheric Pressure.—During the week ending May 13 the reading of the barometer at the level of the sea decreased from 29.97 inches at the beginning of the week to 29.43 inches by 3 P.M. on the 7th, increased to 30.53 inches by 9 A.M. on the 9th, decreased to 30.36 inches by 3 P.M. on the 10th, increased to 30.38 inches by midnight of the

same day, decreased to 30.17 inches by midnight on the 11th, increased to 30.30 inches by 9 A.M. on the 12th, decreased to 30.26 inches by 3 P.M. on the 12th, and was 30.34 inches at the beginning of the week.

The mean reading for the week at the level of the sea was 30.25 inches, being 0.43 inch higher than last week, and 0.32 inch above the average of the week.

Temperature.—The highest temperature in the shade in the week was 70°, on the 11th. On the 9th the highest temperature was 58° 5'. The mean of the seven high day temperatures was 64° 7'. The lowest temperature in the shade in the week was 41° on the 13th; on the 10th the lowest temperature was 49°. The mean of the seven lowest temperatures was 44° 9'.

The greatest range of temperature in one day was 28°, on the 13th; the smallest was 15°, on the 8th. The mean of the seven daily ranges was 19° 9'.

The mean temperatures were, on the 7th, 53° 8'; on the 8th, 49° 7'; on the 9th, 49° 7'; on the 10th, 64° 8'; on the 11th, 57°; on the 12th, 54° 6'; and on the 13th, 53° 3'; of these the 8th and 9th were 1° 9' and 1° 8' respectively below their averages; the rest were 2° 1', 3° 5', 6° 2', 2° 0', and 2° 2' above their averages respectively.

The highest reading of a thermometer with blackened bulb in vacuo, placed in the full rays of the sun, was 139° 5 on the 11th; the highest on the 9th was 91° 5. The mean of the seven readings was 114° 7'. The lowest reading of a minimum thermometer with its bulb placed on grass and fully exposed to the sky was 36° 9, on the 9th. The mean of the seven readings was 40° 5'.

Rain.—No rain fell during the week. Lightning was seen at night in the north and north-west on the 7th.

ENGLAND : Temperature.—During the week ending May 13 the highest temperatures were 76° at Sunderland, 74° 8 at Nottingham, and 73° 3 at Cambridge. The highest temperature at Bolton was 64° 5, at Bradford 64° 7, and at Plymouth 65°. The general mean was 68° 1'.

The lowest temperatures in the week were 35° at Hull, 34° 3 at Nottingham, and 35° 5 at Sheffield. The lowest temperature at Liverpool was 41° 4, at Blackheath 41°, and at Bradford 40° 1'. The general mean was 37° 7'.

The greatest ranges of temperature were 40° 5, at Nottingham, 39° at Sunderland, and 36° 3 at Cambridge. The least ranges were 24° 5 at Liverpool, 24° 6 at Bradford, and 25° 2 at Plymouth. The general mean was 30° 4'.

The mean of the seven high day temperatures was highest at Cambridge, 65° 6, at Sunderland 65° 5, and at Blackheath, 64° 7; and was lowest at Bolton and Bradford, 58° 5, and at Liverpool, 58° 7. The general mean was 61° 7'.

The mean of the seven low night temperatures was highest at Plymouth, 46° 4, at Brighton 45° 4, and at Truro 45°; and was lowest at Wolverhampton and Bolton, 39° 6, and at Hull 40°. The general mean was 42° 0'.

The mean daily range was greatest at Sunderland, 24° 1, at Nottingham 22° 6, and at Wolverhampton 22° 2; and was least at Liverpool, 14°, at Bradford 15°, and at Plymouth 16°. The general mean was 18° 8'.

The mean temperature for the week was highest at Blackheath, 53° 3, at Plymouth 52° 7, and at Truro 52° 3; and was lowest at Bolton, 47° 3, at Hull 47° 8, and at Wolverhampton and Bradford 49°. The general mean was 50° 6'.

Rain.—The largest falls were 1.02 inch at Sunderland, 0.97 inch at Bolton, and 0.94 inch at Leicester. The smallest fall was 0.03 inch at Bradford. No rain fell at Truro, Plymouth, or Blackheath. The general mean fall was 0.27 inch.

SCOTLAND : Temperature.—During the week ending May 13 the highest temperature was 63°, at Dundee and Paisley; at Greenock the highest temperature was 57°. The general mean was 61° 1'.

The lowest temperature in the week was 34°, at Dundee; at Leith the lowest temperature was 38°. The general mean was 36° 3'.

The mean temperature for the week was highest at Paisley, 47° 9; and lowest at Greenock, 46° 5. The general mean was 47° 3'.

Rain.—The largest fall was 1.41 inch at Greenock; the smallest fall was 0.64 inch, at Aberdeen. The general average fall was 0.95 inch.

JAMES GLAISHER, F.R.S.

THE YELLO PARADISE APPLE.—This Apple is described in the *Revue Horticole* as having all the advantages of the ordinary Paradise stock without its disadvantages. It withstands drought better, and as it grows till late in the season it may be grafted till the appearance of the frosts, while the Paradise cannot be grafted after the end of August. It is extensively used as a stock in the nurseries of MM. Simon-Louis, of Metz.

Enquiries.

It is that questioneth much shall learn.—BACON.
FRUIT-GROWING IN CALIFORNIA.—Can any of our numerous readers give me any information on the growing of fruit in California? From what one reads on the subject it seems to be a perfect paradise, but the experience of practical men would be of more value in forming an opinion as to the advisability of going there. *Banana.*

RATING GREENHOUSES.—I rent a number of glass-houses in the way of my trade as a florist, and in a re-assessment of property in this town the overseers have put the assessment at the amount of rent paid. Is it usual to assess nurserymen's greenhouses at all? I have always understood they were exempt beyond the ground occupied. *F. W.*—Having built a range of glass-houses for private use, I am anxious to know if it is liable to assessment for the borough rates, and if so at what percentage? *W. B.* [Will some correspondent who has had practical experience of the work of Assessment Committees, kindly give us their opinion on these points? ED.]

Answers to Correspondents.

BEE ORCHID : *P. Walker.* The Bee Orchid, or Bee Orlchus, is *Ophrys apifera*, a British plant. What may be the Bee Orchid of the West Indies we do not know.

BOOKS : A. Burbidge's *The Improvement and Propagation of Cultivated Plants* (Blackwood) is the only work likely to suit you.

CELERY AND PRIMULA : *B. C. No.*; both are worthless.

GALL ON OAK : *J. Hopkins.* The Woolly Oak-gall,

FIG. 107.—THE WOOLLY OAK-GALL : THREADS WHITE, SILKY.

the work of a gall-fly, *Cynips Quercus ramuli* of Linnaeus. (See fig. 107).

CLOVER SEEDS : A. In judging Clover seeds cleanliness of the sample should be the first consideration; size of the seeds and evenness of the sample the second; and colour the third. It is difficult to lay down a general rule as to colours, and different varieties of Clover vary in colour. Our correspondent should state if he refers to any particular sort of Clover. All varieties of Clover seeds become brown with age, but bad weather will have the same effect on a sample of new seed. If any particular samples of Clover can be forwarded an opinion shall be given on them.

DOUBLE-FLOWERED APPLE : *T. F.* Such flowers are not uncommon on the midsummer shoots. It is unusual to see them on the "spurs," as in your case, but then all the buds except the one are in this case leaf-buds instead of flower-buds. Thus the whole arrangement is abnormal.

MALFORMED GLOXINIAS : *A. W.* See *Masters' Vegetable Teratology*, p. 451, c. 1c. *Gard. Chron.* 1865, p. 895; *L. Morten, Bull. Acad. Belg.*, t. XIV., p. 224, t. 1.

MEDICINA ANABAPTIS : *C. W. Cassel.* Yes, the same colour as *M. magnifica*. We shall be glad to hear from you occasionally.

MELONS : *H. C.* We can give you no idea what may be the cause of the disease without seeing some of the leaves.

NAMES OF PLANTS : *A. H. Smea.* *Oncidium reflexum.*—*W. S. G.* 1, *Schizostylis coccinea*; 2, *Celsia cretica.*—*A. E.* *Schizostylis coccinea.*—*F.* *Helium.* *Lonicera Ledebourii.*—*C. W.* 1, *Cerastium vulgatum*; 2, *Spergularia rubra.*—*H. L.* 1, *Brasavola nodosa*; 2, *Oncidium concolor.*—*C. P. & Co.* *Leucothoe* or *Andromeda axillaris.*—*H. W. P.* Yellow flower, *Doronicum caucasicum*; blue flower, *Omphalodes verna.*—*F. L.* *Staphylea pinnata.*—*W. Z.* *Glossaria.* 1 and 4, *Saxifraga capitata*, var.; 2, *S. hypnoides*; 3, *Tiarella cordifolia.*

Rosher's Garden Edging Tiles.

THE ABOVE and many other PATTERNS are made in materials of great durability. The glazier sorts are specially suited for **KITCHEN GARDENS,** as they harbour no Slugs or Insects, and take little room, and once put down, incur no further labour or expense, as do "grown" Edgings, consequently being much cheaper. **GARDEN VASES, FOUNTAINS, &c.,** in a variety of styles, very durable and of superior finish, and in great variety of design. **F. KOSHER AND CO.,** Manufacturers, Upper Ground Street, Blackfriars, S.E.; King's Road, Chelsea, S.W.; Kingsland Road, E. Agents for **LOOKER'S PATENT "ACME FRAMES,"** PLANT COVERS, and PROPAGATING BOXES; also for **FOXLEY'S PATENT BEADED GARDEN WALL ERICKS.** Illustrated Price Lists free by Post. The Trade supplied.

ORNAMENTAL PAVING TILES, for Conservatories, Halls, Corridors, Balconies, &c., of more elaborate Designs, with Prices, sent for selection.

WHITE GLAZED TILES, for Lining Walls of Dairies, Lavatories, Kitchen Ranges, Baths, &c. Grooved and other Stable Paving of great durability, Wall Copings, Drain Pipes and Lids of all kinds. Roofing Tiles in great variety, Slates, Cement, &c. **F. KOSHER AND CO.,** Brick and Tile Merchants. See Addresses above.

SILVER SAND, fine or coarse grain as desired. Price, by post, per Ton or Truckload, on Wharf in London, or delivered direct from Pits to any Railway Stations. Samples of Sand free by post.

FLINTS and BRICK BUCKS for Rockeries or Ferneries. **RENT PEALS or LOAM** supplied at lowest rates to any quantities. See Addresses above.

N. F. ROSHER AND CO.—Addresses see above. N. F.—Orders promptly executed by Rail or to Wharves. A liberal Discount to the Trade.

OIL PAINT No Longer Necessary. HILL and SMITH'S BLACK VARNISH for Preserving Ironwork, Wood, or Stone. (Registered Trade Mark.)

This VARNISH is an excellent substitute for oil paint on all outdoor work, while it is fully two-thirds cheaper. It was introduced upwards of thirty years ago by the advertisers, and its genuine good quality, notwithstanding a host of unprincipled imitators, is fully attested by its constantly increasing sale. It may be applied by an ordinary labourer, requires no mixing or thinning, and is used cold. It is used in the grounds at Windsor Castle, Kew Gardens, and at the seats of many hundreds of the Nobility and Gentry, from whom the most flattering testimonials have been received.

Sold in Casks of about 20 gallons each, at 1s. 6d. per gallon at the Manufactory, or 1s. 8d. per gallon carriage paid to any Station in the Kingdom.

UNSOLICITED TESTIMONIAL.

"Firefield Park, June 21, 1876.—Sirs.—I have this day forwarded from Chepstow to your address a black varnish cask, which I candidly admit was the best we ever had. Address Varnish to Purcellford, Park, Chepstow.—I am, Sirs, yours respectfully, Wm. Cox."

CAUTION—HILL & SMITH would particularly warn their Customers against the various cheap Varnishes now so much advertised.

H. & S.'S Varnish has been an article of common use on most of the large estates in the kingdom for upwards of thirty years; and their constantly increasing trade in it, and the numerous Testimonials they receive, stamp it as a truly genuine article. Every cask is legibly marked with their name and Registered Trade mark as above, without which none is genuine.

Large Illustrated CATALOGUE of Fencing, Hurdles, Field and Entrance Gates, &c., sent free on application to HILL and SMITH, Brierley Hill Ironworks, Staffordshire; 115, Queen Victoria Street, London, E.C.; and 180, Buchanan Street, Glasgow.

W. H. LASCELLES, HORTICULTURAL BUILDER, 121, RINHILL ROW, LONDON, E. C.

PATENT RED-RUBBER GARDEN HOSE. Stands severe tests of Government Departments, thus proving superiority of quality. Lasts four times as long as ordinary India-rubber Hose, lighter in Weight, Greater in Strength, and Cheaper in the long run than any other Hose for Garden Use. A correspondent writes—"I have had a length of your Red-Rubber Hose in use nine years, and it is now as good as ever."

Private Customers Supplied at Trade Prices. Sample and Price of MERRYWEATHER & SONS, Manufacturers, 63, Long Acre, London, W. C.

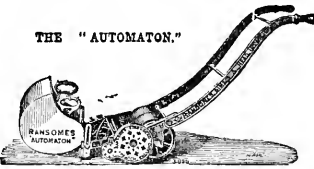

ROCHFORD'S IMPROVED HORIZONTAL BOILER. Unequalled for Simplicity, Power, and Economy. See Gardener's Chronicle, Jan 1880, and Nov. 19, 1881.

As inferior imitations of this now well-known Boiler are being advertised and sold to the detriment of its reputation, C. F. K. & Co. beg to inform Gardeners and the Trade generally that Mr. Rochford has assigned to them the sole and exclusive right for its Sale and Manufacture.

HOT WATER PIPES AND BOILERS. From our large and complete stock at wholesale prices. CHARLES P. KINSELL & CO., IRONFOUNDERS, 31, BARKSIDE, LONDON, S. E.

THE "AUTOMATON,"

Sizes, 2 to 24 inches.

THE BEST GENERAL PURPOSE MACHINE.

The "AUTOMATON" Lawn Mowers are thoroughly strong, well-made, and durable machines, and the best suited for general work and Gardeners' use. They cut the grass perfectly, leave no ribs, but produce a smooth velvety surface on the Lawn, and are light in draught.

The "AUTOMATONS" have *front* rollers for general work, and *rear* rollers for cutting long grass, or when it is unnecessary to roll the grass in front of the cutters. They have the best machine made gearing, the best self-sharpening knives of steel and iron rolled together, and automatic silent drivers.

R. H. & J. also manufacture "REVERSIBLE" Lawn Mowers for Small Gardens and Borders, and "HORSE-POWER" Lawn Mowers for Large Lawns, &c.

RANSOMES' LAWN MOWERS ARE THE BEST. AWARDED.

MELBOURNE EXHIBITION, 1881. THE HIGHEST AWARD.

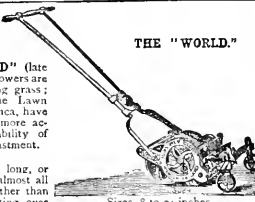

THOUSANDS IN USE. SENT CARRIAGE PAID. MONTHS TRIAL ALLOWED. NO CHARGE FOR PACKING.

COMPLETE PRICE LISTS FREE BY POST.

STOCK KEPT IN LONDON at Arch 92, Spitalfields Station, Bethnal Green, E., and Machines may be ordered from any respectable Ironmonger.

Ransomes, Head & Jefferies, ORWELL WORKS, IPSWICH.

THE "WORLD,"

Sizes, 8 to 24 inches. FOR CUTTING LONG GRASS.

The "WORLD" (late "GLOBE") Lawn Mowers are intended for cutting long grass; and, whilst similar to the Lawn Mowers imported from America, have the special advantages of the more accurate fitting and general durability of English manufacture and perfect adjustment.

The "WORLDS" will cut wet, dry, long, or short grass without clogging, and cut off almost all the "hoary." They leave the surface smoother than similar machines, and are well adapted for getting over a large amount of work with little labour.

PARISIAN GREENHOUSE BLINDS.

Made of Wood and Galvanised Iron only.

Medals awarded: Paris, Marseilles, Bordeaux, &c. SOLE AGENTS FOR GREAT BRITAIN, W. RICHARDSON & CO., North of England Horticultural Works, DARLINGTON.

BOXES FOR SENDING FRUIT BY RAIL.

Made of stout wood, planed and hinged, with fastenings and holes, through which a string can be passed and sealed on the top to prevent all tampering or pilfering. Movable wooden divisions keep each Peach, &c., in its place. Wrapped in wool or tissue paper they fit in firmly and never bruise.

Boxes for 6 Peaches, 10d. each, or 9s. 6d. per dozen.

To Make Money by the Sale of Advertisements.

ROBINSON & CLEAVER & COLLINS, BELFAST.

IMPORTANT NOTICE.—Advertisers are cautioned against having Letters addressed to INITIALS, or to FICTITIOUS NAMES, at Post-offices, as Letters so addressed are not forwarded, but are sent at once to the Returned Letter Office.

WANTED, a strong, active youth, 17 or 18 years of age, as UNDER GARDENER. One accustomed to the work. No lodgings.—Apply, by letter, to GARDENER, Craoburn Lodge, St. Margarets, Herts.

WANTED, an UNDER GARDENER. Wages 12s. and body. Must have had experience in the setting up of Cut Flowers, in own handwriting, making bags, particulars of last situation, and accustomed to pack plants. Also WANTED, an IMPROVER, to Work in Garden and Nursery. Wages 12s. per week and body.—Apply by letter, in own handwriting, stating age, height, and particulars of last situation, to THOS. CHRISTY, F.L.S., Malvern House, Sydenham, S.E.

WANTED, an industrious FOREMAN, thoroughly up in Forcing, Flower and Kitchen Gardening; would be left considerably to himself, and must take his turn at all work. If suitable might become Gardener.—State full particulars and wages required to W. A. GLYNN, Esq., Seaview, Isle of Wight.

WANTED, for a Nobleman's place in Ireland, two active industrious young men, one as SECOND—must have a good knowledge of room furnishing and the setting up of Cut Flowers; the other as JOURNEYMAN, to work in the Houses. Must be Protestants. Wages 12s. and 14s. per week respectively, with body, &c.—T. J. HART, The Gardens, Barr Castle, Farnstown, Ireland.

WANTED, an OUTDOOR MAN, who understands Herbaceous Plants.—Mr. BRUCKHAUS, Hooper's Nursery, Twickenham.

WANTED, a steady, industrious MAN, well up in the Growth of Soft-wooded Plants and Roses under glass.—FRANK HILLIER, Gonville Nursery, Cambridge.

WANTED, a SECOND, amongst Stove and Plants Propagating, &c.—also a SECOND for the Greenhouses. None but good hands need apply.—W. CHURCH, Howard's Nursery, Southgate, N.

WANTED, a MANAGER in a London Nursery.—State age and experience, especially of those departments he is most familiar with.—Reply by letter to K. R., Gardeners' Chronicle Office, W.C.

WANTED, an experienced NURSERY CLERK and CORRESPONDENT; must know the value of every seed, and be qualified, if required, to make up by letter, marked "Nursery Clerk," with copies of testimonials, stating salary required, care of Messrs. Robertson & Scott, Westerington, 13, Hawker Street, London.

WANTED, ONE or TWO good HANDS at GRAPE THINNING.—Mr. WOODTHORPE, Glazenwood Nursery, Brantree.

WANTED, a smart young MAN, to look after Horse and Cart, and to make himself generally useful. A Countryman preferred.—Apply to JOHN MUNRO, Cambridge House, Twickenham.

WANT PLACES.

IMPORTANT NOTICE.—Advertisers are cautioned against having Letters addressed to INITIALS, or to FICTITIOUS NAMES, at Post-offices, as Letters so addressed are not forwarded, but are sent at once to the Returned Letter Office.

Scott's Gardeners.

LITTLE and BALLANTYNE, NURSERYMEN, Mrs. Carlisle, have exceptional opportunities for assisting Noblemen and Gentlemen securing the services of first-class GARDENERS, UNDER GARDENERS, BALIFFS and FORESTERS. They have at present several very excellent men on their Register, and will be glad to send particulars of them to any in want of such.

B. S. WILLIAMS begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BALIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, with the best selections for the different capacities will be made.—Holloway, N.

THE LIVERPOOL HORTICULTURAL COMPANY (John Cowan), Limited, are in a position to recommend an exceptionally good man as GARDENER, or STEWARD and GARDENER to any Nobleman or Gentleman requiring such.—Address the MANAGER, Vineyard and Nurseries, Garston, near Liverpool.

RICHARD SMITH and CO. beg to announce that they are constantly receiving applications from Gardeners seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

GARDENER (HEAD).—J. S., Gardener to the late C. DARWIN, Esq., is at liberty to engage with any Nobleman or Gentleman requiring the services of a thorough practical man.—Down House, Down, Beckenham, Kent.

GARDENER (HEAD).—Age 26; married (when suited). Thorough knowledge of Orchids, Vines, Pines, Azaleas, and exotics, in Pot and in the Open. Flower and Kitchen Gardening; first class references.—R. EDWARDS, Hammerwood, East Grinstead, Sussex.

GARDENER (HEAD).—Age 38; married, no family. Twenty-three years' experience in all branches of Gardening. Eight years Head in a Nobleman's Nursery, King's Road, Chelsea, S.W.

GARDENER (HEAD, or SINGLE-HANDED).—Age 30, married; understands Vines, Peaches, Stove and Greenhouse Plants, Cucumbers, Melons, Flower, and Kitchen Gardening. Good references.—GEORGE LOCKE, 9, Fleet Road, Hampstead, N.W.

GARDENER.—Age 38, single; thorough experience. Willing to live and be useful in the house, if required. Good character.—E. MASON, Elm Lodge, Oxford Road, Reading, W.

GARDENER (PLAIN).—Age 22; would not object to a Cow. Good character.—T. HUNTER.—THE GARDENER, The Downs, St. Neots, Hants.

GARDENER (SECOND).—Age 21; ten years' good experience. Can be well recommended.—E. O. BRADY, 36, Cochrane Street, St. John's Wood, N.W.

GARDENER (SECOND), where four or five are kept.—Age 24, single; two years and seven months in present situation. Can be well recommended.—A. H., 295, Goldhawk Road, Shepherd's Bush, W.

GARDENER (SECOND).—Age 26; ten years' experience both in the House and in the General Work of a Gentleman's Garden. Good references from previous situations.—J. S., 10, Abyssinia Road, Battersea Rise, S.W.

GARDENER (UNDER).—Age 19.—A. MORTIMER, Market Gardener, Throveton, Cullumpton, Devon.

GARDENER (UNDER), where two or more are kept.—Married, no family; understands Fruit Trees, Kitchen and Flower Garden. Four years in last place.—J. C., Blackburn, 10, Gresham Street, Leicestershire Square, S.W.

GARDENER (UNDER), in a good establishment.—Age 16; brought up to Gardening. Has at either Inside Work or Out. Good character.—J. NICHOLSON, The Gardens, Solihole, Northallerton, Yorkshire.

FOREMAN, in the Houses.—Good references.—W. HACKER, The Gardens, Old Warden Park, Biggleswade, Beds.

FOREMAN (in both).—Age 27; good character. Twelve years' experience, two years in last place.—H. G. H., Frost, Wellington Road, Slough.

FOREMAN, or PLANT-GROWER and PROPAGATOR (SOFT-WOOD).—Age 30, single; can be well recommended.—H. S., Rose Cottage, College Road, Epsom, Surrey.

FOREMAN (GENERAL), or to take Charge of Houses.—Age 28; has been in some of the best references. Thoroughly understands his work; fourteen years' experience. First class testimonials.—R. DALE, Greenbridge, Tunbridge Wells.

To Nurserymen, &c. FOREMAN (GENERAL, WORKING), SALESMAN or PROPAGATOR. Twenty years' practical experience, indoors and out; perfectly acquainted with the working of a large business, knows Herbaceous Plants and Hardy Bulbs well, with outside work of the Second Trade. Highest references.—E. T., 11, Guthrie Street, Cale Street, Chelsea, S.W.

To Nurserymen. PROPAGATOR and GROWER (SOFT-WOOD), or INDOOR FOREMAN.—Single.—A. B., King's Field Villa, Roxborough Road, Harrow.

JOURNEYMAN (FIRST), in large establishment.—Age 21; two and a half years in present situation. Can be well recommended.—Previous masters.—WM. BIRD, Warristery, Pocklington, York.

JOURNEYMAN (FIRST, or good SECOND).—Age 22; three years in last place. Good references.—W. FOX, 10, Farrow Road, West Kensington Park, London, W.

JOURNEYMAN, in the Houses, under references.—A. CHERNEY, Bellefields Lodge, Englefield Green, near Staines.

JOURNEYMAN, in a Nobleman's or Gentleman's family.—Age 23; seven years' experience in all branches. Good references. Body preferred.—G. WING, Husbands Bosworth, near Rugby.

JOURNEYMAN, in a good establishment.—Age 18; five years' good character. Body preferred.—ALPHA, Mr. Locke, Nurseryman, Station Road, Red Hill, Surrey.

JOURNEYMAN, in the Houses.—Age 22; first-class testimonials. Twelve months in present place.—JAMES WILLIAM SHARRATT, Rose Cottage, Lammermoor Road, Balham, S.W.

JOURNEYMAN, in the Houses, under a reference from last and previous places.—Age 10 good character from last and previous places.—W. S., Mr. J. Serman, Regent Hotel, Leamington.

JOURNEYMAN, in the Houses.—Sober, hard-working, and industrious.—Understands Vines, Peaches, Stove and Greenhouse Plants, Flowering House, and has good testimonials from last situation.—W. H., Mr. Fowie, Dogmersfield Gardens, Wincfield, Hants.

JOURNEYMAN, in the Houses, or SECOND in a large Garden.—Age 22; five years' experience. Good references.—F. S. HILLING, Broadbushery, Honiton, Devon.

JOURNEYMAN, or IMPROVER, in a WILLET, Wyesham, Monmouth.

IMPROVER, in a Gentleman's Garden.—Age 19. Body preferred.—CHARLES SORSBY, Moorgate House, Rotham, Yorks.

IMPROVER (O. GERTON, Age 19).—Seven years' experience in Flower Garden, Lawns, Conservatories. Strong, steady, very obliging. Under Glass preferred. State terms, &c.—H. W. PITCHER, Crick, Hatfield, Bedford, &c.

TO FERN GROWERS, Market or otherwise.—The Advertiser (aged 30) desires a situation, thoroughly understands the raising by thousands of several hundred varieties, also General Nursery work under Glass. At present principal Proprietor, Messrs. Birkenhead's Fern Nurseries, Sale, near Manchester. Good references. Present and previous employers: 15 years' experience. Good testimonials.—E. S. Messrs. Birkenhead, Fern Nurseries, Sale, Near Manchester.

TO NURSERYMEN and GARDENERS.—An experienced young man will give £2 to any one procuring him a situation in a public or private Garden or Nursery. Good character from present and previous employers.—H. 15, Gardeners' Chronicle Office, W.C.

TO NURSERYMEN.—Experienced young man (aged 22) seeks a situation in a good nursery. First-class references.—S. BATSON, Upton, Southwick, Hants.

TRAVELLER, or MANAGER.—MR. STEVENS BARRATT offers his services to those requiring a thoroughly practical, experienced, and competent man, conversant with every branch of the Nursery and Seed Trade. Has travelled the United Kingdom with his family half years last engagement.—37, Bepton Street, Shrewsbury.

To Nurserymen and Seedsmen. TRAVELLER.—Thorough knowledge of the business in all its departments, and well acquainted with the Trade over the three Kingdoms. Salary or salary and commission.—A. C. E., Messrs. W. Nutting & Sons, 60, Barbican, London, E.C.

SHOPMAN, or SECOND, Wholesale or Retail.—Well up in Vegetable and Flower Seeds. Good references. Seven years' experience.—G. 110, Kennington Road, S.E.

BRICKLAYER and HANDY MAN.—A young man (single), wants employment on a Gentleman's estate above, would make himself otherwise useful.—BRICKLAYER, 8, Kent Terrace, Cuthbert Road, Croydon.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicate and nourishing beverage which may save us many heavy doctor's bills. It is by the judicious use of this article that a constitution may be gradually built up until strong enough to resist every attack of disease. Hundreds of subtle poisons are floating around in ready to attack wherever there is a weak point. By using Epps' we escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly-nourished frame."—Civil Service Gazette.

Made simply with boiling water or milk. Sold only in packets, labelled.

JAMES EPPS and CO., HOMEOPATHIC CHEMISTS, LONDON.

GrATEFUL AND COMFORTING.

Made simply with boiling water or milk. Sold only in packets, labelled.

JAMES EPPS and CO., HOMEOPATHIC CHEMISTS, LONDON.

Makers of Epps's Chocolate Essence for Afternoon use.

HOLLOWAY'S PILLS.—Enfeebled existence.—This medicine embraces every attribute required of a general and delicate medicine for the treatment of disease laid by defective food and impure air. In obstructions or congestions of the liver, lungs, bowels, or other organs, these Pills are especially and eminently successful. They should be kept in readiness in every case, being a medicine of incomparable utility for young persons, especially those of feeble constitution. They never cause pain, or irritate the most sensitive nerves or most tender bowels. Holloway's Pills are the best known purifiers of the blood, the most active promoters of absorption and secretion, whereby all poisonous and obnoxious particles are removed from both solids and fluids.

Merchants, Worcester.

Novelty.
GRAND NEW BEDDING PLANT.
LOBELIA "ANDREW HOLMES."
This splendid variety is now offered as the best Lobelia
extant. It is possessed of a hardy growth, compact, cushion-
like habit, and excessive floriferousness, combined with the in-
tense deep blue colour the Yorkshire Horticultural Society
"Elber" remarkable, having, at the same time, a small, well-
defined white eye, being brighter and of much evener growth
than that variety, and lacking its tenderness. Confidently
recommended by the expert, who is now distributing it,
as superior to every kind cultivated.

The following testimonial is from Mr. J. FIELDEN, Head
Gardener to the Yorkshire Horticultural Society:—
"THE MUSEUM GARDENS, York, May 22, 1882.
"LOBELIA ANDREW HOLMES I consider in the fore-front of
the many really good Lobelias now before the public. It has a
good compact habit, very floriferous, and in colour not unlike
Gentiana verna, one of our loveliest alpine gems, and must soon
become a popular favourite." J. FIELDEN.
"TO THE GENTLEMEN, &c.
Price 1s. each, 5s. per dozen, 60s. per 100.
The usual discount to the Trade.

The most Beautiful Hardy Climber Known. CLIMBING HONEYSUCKLES, suitable for arches, trelliswork, window boxes, &c., covered with delicately-scented blossoms all summer and scarlet berries in winter; very hardy. See the well rooted plants for this season's flowering, 1s. free. H. JALLAND, Horncastle, Lincolnshire.

SPECIAL OFFER OF ORCHIDS

The following beautiful and rare orchids are offered at low prices, and will be found to be nice-sized, healthy plants; they have not yet been flowered, and probably contain many rare varieties in value quite out of proportion to prices at which they are quoted. They are offered by the importer to make room for fresh importations, cost-tightly arriving.

Table listing various orchid species such as Ardisia alfine, Pheidon 7s. 6d. & 10s. 6d., and others with prices per dozen or per 100.

All orders and letters to be addressed to 10, Cullum Street, London, E.C., and not to Nurseries, Twickenham, Middlesex. P.O.O. payable to W. GORDON, Mark Lane.

PERALANCIUMS, in variety. HYDRANGEAS. RHODANTHE MANGLESII.

HUGH LOW and CO. have to offer the above, in large quantities, in flower and bud, ready for immediate use. Price, per dozen or 100, on application.

CLAPTON NURSERY, LONDON, E.

POLYANTHUSES, PRIMROSES, HEPTATICAS, and AUCULAS.

Apply to MR. COOPER, F.R.H.S., CALCOT GARDENS, NEAR READING, BERKS.

NEW BOMAREA.

Flowers Orange and Yellow, with Red Spots. "BOMAREA FRONDEA"

SHUTTLEWORTH, CARDER & CO.

Have great pleasure in offering the above beautiful new cool conservatory climber for the first time. Good established plants, 21s., 42s., and 63s. each. For description see Gardeners' Chronicle, May 20, 1882, p. 698, by Dr. Masters.

SHUTTLEWORTH, CARDER & CO., 145, PARK ROAD, CLAPHAM, S.W.

This Design was invented by Messrs. SUTTON & SONS, in July, 1881, and is their property.

No similar Design was in existence until long after this date, notwithstanding statements put forth which appear to contradict the fact.

Messrs. Suttons' Customers are hereby cautioned against imitations.

THE QUEEN'S SEEDSMEN, READING.

THE AMERICAN PLANTS at Knap Hill are now in bloom, and may be seen daily, Sundays excepted. The EXHIBITION of RHODODENDRONS and AZALEAS at the Botanical Gardens, Regent's Park, is also now on view daily. Orders of Admission may be obtained from Fellows of the Society, or from the Exhibitor, ANTHONY WATERER, in Kotten Row. The RHODODENDRONS in Kotten Row are supplied by ANTHONY WATERER, Knap Hill Nursery, Woking, Surrey.

Tuberous Begonias. JOHN LAING AND CO.'S Gold Medal Collection is unrivalled. They have now in cultivation 100,000 Begonias, which will present to the public an unprecedented floral display this summer. Orders now booked for blooming plants middle of June. Prices, 12s. to 60s. per dozen. CATALOGUES on application. Address JOHN LAING AND CO., Forest Hill, S.E.

CYPRIPEDIUM SPICERIANUM.

HUGH LOW and CO. can offer the above-named lovely species, in good healthy plants, by the dozen or 100. Prices on application.

CLAPTON NURSERY, LONDON, E.

OUR EIGHT HOUSES (100 feet each) of PELARGONIUMS, forming one continuous a feet bank, 1600 feet long, of the richest colour. The whole family is now represented by all the best and most distinct in cultivation—900 varieties—such a sight as probably never before seen. For full particulars see CATALOGUE.

H. CANNELL & SONS,

PRIVATE EXHIBITION OF ORCHIDS.

Mr. WILLIAM BULL'S Exhibition of Odontoglossums and other choice Orchids is now open to Patrons of the Establishment, and to those having received invitations. Several magnificent new kinds are in blossom.

Establishment for New and Rare Plants, 536, KING'S ROAD, CHELSEA, LONDON S.W.

KING'S ACRE, near Hereford.—May, 1882.

GRASS SEEDS FOR LAWNS,

Of the finest close-growing Evergreen kinds, &c. per lb. Special preparations for all purposes, soils, and situations. Advice gratis.

Unsolicited Testimonials:— "Knowing how difficult it is to obtain pure stocks of grass seeds, even when grown in a secondary consideration, I write to say the supply I obtained from you for our new terrace lawns has given the greatest satisfaction. "Please send me three bushels of the very best Lawn Grass Seeds, suitable for an exceedingly hot upland soil. The seed I have had of you has been the only kind which has been able to resist the influence of the sun and drought upon my thin, gravelly soil."

FARM SEEDS Of all kinds, which have given unqualified satisfaction. See Illustrated and Descriptive LIST, free on application.

UNSURPASSED FLOWER and VEGETABLE SEEDS. LIST Free by Post.

RICHARD SMITH & CO., SEED MERCHANTS and NURSERYMEN, WORCESTER. (ESTABLISHED 1804)

TWO SPECIALITIES WORTHY OF EXTRA NOTICE.

The best Zonal Pelargonium in Cultivation for Summer Bedding is undoubtedly MILES' WEST BRIGHTON GEM. After five years' trial it still holds the first position as the most floriferous, compact, and effective variety yet introduced. Awarded Three First-class Certificates. Price, in 6-sized pots, 6/6 per dozen, 12/6 per dozen, 15/6 per dozen, 18/6 per dozen. Special quotations for large quantities.

MIGNONETTE. No variety ever introduced has been found to equal MILES' NEW HYBRID SPIRAL. Its beautiful, robust, compact and floriferous habit is the admiration of all who see it. It is far more fragrant than any other variety. Price of seed (in single packets, 6/6 per dozen, 12/6 per dozen, 15/6 per dozen, 18/6 per dozen. Liberal Discount to the Trade.

W. MILES, WEST BRIGHTON NURSERIES, HOVE, SUSSEX.

ORCHIDS.

The Largest and Best Stock in Europe of good Established Plants. Tens of Thousands of Plants to select from.

MR. WILLIAM BULL Begs to intimate that his Orchid-houses are always quite a sight, from the large number of plants in flower, and he will be pleased to show them to any one interested in this beautiful class.

MR. WILLIAM BULL Recommends those desirous of having their Honours gay with Orchid flowers, to purchase good established well-cultivated plants, which bloom well, are far more satisfactory, and comparatively cheaper than newly imported or semi-established plants. Establishment for New and Rare Plants, 536, KING'S ROAD CHELSEA, LONDON, S.W.

ARECA LUTESCENS.

To hand consignment of Seed, in unusually fine condition, from Madagascar. This variety is far freer growing, and of finer colour than the Brazilian variety. Price on application.

SANDER & CO., ST. ALBANS.

B. S. WILLIAMS

Has much pleasure in announcing that he has determined to make a grand show of his flowering ORCHIDS, during the next two months, at home. The Exhibition will include, in addition to the usual stock of young Flowering Plants, all the grand specimens that he has been in the habit of including in his Collections, which have obtained the leading prizes for many years both at home and abroad.

Patrons of Horticulture are especially invited to inspect this Exhibition.

The Exhibition will contain large and small specimens of ODONTOGLOSSUMS, CATTLEYAS, LELIAS, ONCIDIUMS, CYPRIPEDIUMS, MASDEVALLIAS, VANDAS, AERIDES, SACCOLABIUMS, and other rare and showy ORCHIDS.

AN EARLY INSPECTION IS RESPECTFULLY INVITED. NO CARDS TO VIEW REQUIRED.

A hearty welcome will be given to all who honour us with a visit.

CARRIAGE ROUTE.

Carriage Route from the West End is through Albany Street, Regent's Park, Park Street, Camden Town, Kentish Town, and Junction Road.

The North Metropolitan Tramway Cars, in addition to the Street Tramways Company's Cars, arrive at and start from the Nurseries, for the City and West End, every few minutes. The Great Northern Main Line trains all stop at Holloway Station, which is within fifteen minutes' walk of the Nurseries. The Midland and Great Eastern Main Line trains all stop at Kentish Town Station, which is within ten minutes' walk of the Nurseries. The Midland, in connection with the Metropolitan Railway, runs frequent Trams during the day from all parts of London to Upper Holloway Station, which is within three minutes' walk of the Nurseries.

NEW ROSES FOR 1882.

WM. PAUL & SON,

(Successors to the late A. PAUL & SON, Established 1806.)

PAUL'S NURSERIES, WALTHAM CROSS,

Beg to announce that they are now sending out strong plants of the following

NEW ROSES:—

DUKE OF ALBANY, H.P. (Wm. Paul & Son).

This fine variety produces large and full flowers of magnificent petal, vivid crimson in colour when first opening, but changing darker as they expand, and developing a beautiful shading of velvety-black. It has been figured in the *Floral Magazine* for November, 1881. Price 10s. 6d. each.

THE NEW AFGHAN YELLOW ROSE (Rosa Ecce).

This interesting novelty has been recently introduced from Afghanistan, by Dr. Aitchison, and is figured and described in Nos. 117-119 (vol. xix.) of the *Journal of the Linnean Society*. The flowers are bright yellow, single, and exceedingly numerous, being borne on short lateral shoots all along the branches. 10s. 6d. each.

THE NEW FRENCH ROSES FOR 1882, including HELEN PAUL (probably the best light Hybrid Perpetual) and ULRICH BRUNNER FILS (Certificated by the Royal Horticultural Society). 3s. each; 30s. per dozen.

P.S.—In reply to numerous enquiries Wm. P. & S. beg to state that their new variety "QUEEN OF QUEENS" (Certificated by the Royal Botanic Society) will **NOT** be sold this spring.

ROSES in Pots, for Spring and Summer Planting.—A very fine stock or all the leading varieties, 12s. to 18s. per dozen; and the same of extra size, 21s. to 30s. per dozen.

CLIMBING ROSES in Pots—The best kinds both for Outside and Conservatory Planting, at the same prices as the preceding.

ROSES in Pots, for Pot Culture.—All the most suitable varieties, 12s. to 18s. per dozen; extra strong established plants, 21s. per dozen and upwards.

Priced Descriptive CATALOGUES, post-free, on application.

Wm. Paul & Son, Waltham Cross.

NEW DOUBLE CINERARIAS.

**HIGHEST AWARD
For BEN'S BOILER,**

Which also obtained the Medal last year.

**THE ONLY AWARD
For GLAZING.**

Patent Lead Bars requiring no Putty; also Glazing with under Putty and none outside.

BRONZE MEDAL

For GARDEN SEATS :

The Highest Award (Silver Medal) in this Class being given to the same Seats in a Larger Collection.

The Novelty being

MEAD'S REFLEX SEAT and TABLE,

Readily changed, and combining, in addition, a Box under seat, for Tennis, Croquet, Tools, &c. Useful to Cricketers for Scoring, Bats, Balls, &c.; also for Schools, Chapels, Lecture Rooms, &c.

In addition to the above there are exhibited other Boilers, including the New Patent Wrought-iron Tubular and Conical called

THE "MONARCH,"

For use either as an Independent Boiler, or set in Brickwork.

Also GAS BOILERS, GAS STOVES, Small Apparatus with Copper Boiler and Wrought-iron Double Tubes, for Water, Heated by OIL or GAS.

Portable-jointed Pipes and Valves of various kinds, Iron Vases, Tables, Scrapers, &c.

B. W. WARHURST,

Horticultural Engineer,

33, HIGHGATE ROAD, LONDON, N.W.

Pamphlet on Glasshouses and Heating, and Illustrations and Prices of above, on application.

Gardeners' Chronicle.

SATURDAY, MAY 27, 1882.

MICKLEHAM.

ALL who know even so little of Surrey as the route by railway from Red Hill to Guildford must have admired the picturesque escarpment of the North Downs on the one hand, and on the other the hills of the Lower Greensand, whose upheaval Sir Charles Lyell admirably described. The country is always pretty and varied, often watered with streams and streamlets rising in Leith Hill or other heights, and it abounds in native timber; but it must not be supposed that the scenery of Surrey is the work of unaided Nature, who cares not for scenery while man delights in it. In Mickleham, which Sylvia Evelyn visited and helped by his advice to adorn, and which is almost within sight of his own Beech woods, one may well remember that arboriculture is an art which "mends Nature."

A landscape without trees, and trees well placed, too, is poor as a rule. Nature unclothed, one might say, is naught; and, moreover, she cannot usually be trusted in the work of self-adornment. She formed the Surrey hills, but what would they be if the hand of taste had left them, as she often did, unplanted? What would Mickleham Downs be without its Junipers and Firs? And, as Nature is a poor planter—remiss, indifferent and slow, often neglecting altogether what is needful to be done, or leaving in her woods a wreck of timber, cumbering the ground when replanting would be the proper course to pursue—it is fortunate for any district when the hand and eye of taste are both upon the spot, with a deep purse to assist.

These general remarks are particularly applicable to Mickleham, because that very pleasant spot of earth, chalk for the most part, with a river and a railway running through it, less than an hour from London, and only one station short of the brisk and pretty town of Dorking, attracts wealthy families within its limits, and offers an example of commendable adornment of the artificial kind.

From the knolls and high places in Norbury Park might have been seen, a hundred years ago, a pleasant landscape, which is now, however, more varied and far more charming, and which gains fresh beauty as the work of ornamental planting proceeds. From such a height I counted among many good houses several newly built and planted, and each of them had added a new charm to the landscape. These eight or nine places, all in sight from the same knoll, may be mentioned. They are Givon's Grove, the residence of Mr. Russell Sturgis, an old place and large; Charley Court, Mr. Dickson's, a new place, large, on the side of the chalk hill opposite—not a place for the rapid growth of trees, one would think, but Mr. Dickson has the art of making them grow, by the use of gold-water, or gold-dust it may be, but at any rate he has clothed the bare hill, sheltered his site, and effected a very great improvement. Birch Copse, Mr. Præd's beautiful place, about eighteen years built, adjoins the last, a little nearer Mickleham Downs, which Nature left bare, and which appears from this outlook to be now sufficiently planted.

Birch Cope must needs be pretty, but it does not appear to be a Nature-planted spot, and even if the dense mass of Yews on the slope and ridge behind the house were sown by Nature, she certainly did not plant the shrubbery, nor the timber generally. Mickleham Hall, occupied by Mr. Clarke, is an old place in the valley near one of the "Swallows" where the waters of

"The sullen Mole that ramoth underneath"

are engulfed in dry weather. It boasts some specimen trees, and it cheers the valley in appearance, especially from Norbury Park, Mr. Grissell's seat—and there are few spots where Nature has effected more, and yet where tasteful planting has added more than in the park owned by Mr. Grissell. Juniper Hill, Mrs. Lampton's, and Pinehurst, Mr. H. Grissell's, are both high up under the back of Mickleham Downs, and they are both profusely planted, and owe half their beauty to the artifice of the planter. Juniper Hill stands between these two, and Mr. Richardson is, no doubt, proud of his celebrated Cedars of Lebanon, as well as his historic residence.

From this high part of Norbury Park in the same art-improved parishes of Mickleham and Leatherhead—for our examples occupy ground in each—one can see Denbies on that hill above Dorking which I remember smooth and round as the back of a Chinese pig, and which Mr. Cabott has wrapped in choice raiment, varied and beautiful. I thought this spring, when I saw the hill once more with its leafage newly fluttering. If Nature can hardly obtain the credit of having planted Box Hill with the shrub that gave it a name, if the Box be not indigenous, as some writers say, at any rate this outlook in Mickleham shows how much of the beauty of a Surrey landscape is the work of man and not of Nature. Who planted these distant Chestnuts in Detchworth Park, the largest in the county, and 25 feet in girth, measured fair?—and the Lime avenue, a thousand yards long, with double rows of trees of 120 feet high?—and the great Horse Chestnut, and the Catalpa near the Castle? Then there is the late Sir Benjamin Brodie's favourite, Brockham Warren, now his son's, high on the hill, and sheltered by plantations. Nature would have left it to be blown into the Mole. Palatial Deepdene, too, full in view from Mickleham's high places—for at Brockham we had turned the corner round by Box Hill—lends us further evidence of man's skill in its exquisite shrubberies, planted chiefly with trees and shrubs, which, however familiar they may be, were denied to this country by niggard Nature, just as she denied Australia all the fruits which flourish there now.

Foxbury, Mr. Bickett's charming place, stands high up just outside Mr. Grissell's park, and owes much of the beauty of its landscape and all the shelter of its shrubbery to the same artificial methods which I have endeavoured to extol, to the honour of all who practise or encourage tasteful planting and judicious thinning. *H. E.*

New Garden Plants.

CATTLEYA LABIATA BELLA, *nov. var.*

I HAVE received two glorious flowers of this superb novelty from Mr. B. S. Williams, who informs me that they came from Mr. G. Hardy, Timpeterley, Manchester.

Though it is usually quite intolerable to have to speak about Cattleya flowers without the least knowledge of their origin, their habit of growth, their con-lancy, &c., yet I could not in this case help being exceedingly delighted, as I had the impression I had never seen such a thing before, and this was also the impression of Mr. B. S. Williams.

I was much pleased with the pale whitish mauve-lilac of the petals and the much finer mauve-lilac of the whole fore part of the lip, this being covered with a very distinct and darker mauve-lilac, separated by narrow white nerves. The upper part of the lip is covered with ochre or yellow blotches. The flower

is grand, and very wavy as it appears. The sepals are of the finest, clearest white. I distinctly state that Mr. B. S. Williams calls the colour "lilac" simply, while I say "mauve-lilac." I regard lilac as a little ambiguous, as it may lead people to think at once of the flowers of *Syringa vulgaris*, which are so very different as to colour.

Even in the case of a variety of Cattleya labiata being as distinct as this, it is exceedingly disagreeable to have to write on such poor materials as two flowers. Cattleys must be determined from the examination of all the specimens introduced, judged from the totality, and I have pointed out this in the (unpublished) remarks on Cattleya labiata Percivaliana. I made a guess, and to control it I consulted Mr. B. S. Williams. I got the answer: "Growth like Cattleya Mendelii." Well, I had thought of the very same thing. Mr. Hardy, indeed, had obtained it as Cattleya Keineckiana. This being a fine Mossia, the name was given by mistake. It rather appears that Sir William Hooker's very good representation, *Bot. Mag.* 1669, is altogether forgotten. Ah, I remember well the enthusiasm this representation excited at Dresden. Sir William had stated it to be the most magnificent of all orchideous plants, and was regarded by us as one of the luckiest botanists of the world for having seen this wonder. *Tempto a mutantur!* *H. G. Rehb. f.*

ODONTOGLOSSUM SCHREDERIANUM, *nov. hybr.*

An unusually nice novelty has just appeared in the garden of Baron von Schroeder, The Dell, Windsor. When fully grown, and bearing a panicle of thirty flowers, it will have a bewitching effect.

The general shape of the flower is that of *Odontoglossum tripudians*. The sepals and petals are oblong acute, wavy, white, with mauve-purple blotches. The lip is pandurate, the upper part broader and larger, the fore part narrower, much smaller, obovate, with an apiculus in front. A strong, much developed callus in front of the column on the disc of the upper part shows on each side such a plate of radiating spines as in both *Odontoglossum tripudians* and *Pescatorei*, in which two serrate plates stand upright. The lip is white, with two mauve-purple blotches in the fore part of the disc, and the calli are yellow with some red spots. The lip is adnate to the base of the column, which is white, yellowish below the stigma, and with entire toothletted white wings. A few mauve-purple spots are scattered over it.

What is it? Nothing like it has appeared before in Europe. The columnar wings and the nature of callus forbid to think it a white-mauve *Odontoglossum tripudians*. It may be a cross between this and *Odontoglossum Pescatorei*—perhaps *O. Veitchianum*.

It may bear the name of its lucky possessor, who is one of the most energetic and zealous Orchidists of the time. *H. G. Rehb. f.*

PHALENOPSIS DELICATA, *nov. hybr.*

This is an elegant plant, that has cost me much toil. Judging from a drawing made at its resting place at Upper Clapton, it seems to have roots and leaves like those of *Phalénopsis amabilis*, hence it is not *P. Veitchiana*, but comes near *intermedia*, Lindl., if not itself. Its chief distinction must be based on the lip's top, having neither good *amabilis* tentils (as are to be seen in Dr. Lindley's type, even now carefully kept like an old emulazony at the Royal Exotic Nursery of Messrs. Veitch), nor forcipate teeth, as in *P. intermedia* Portei and its glorious subvariety (boasting the richest colours ever seen in any *Phalénopsis* of this tribe) *biyuerciana*. The convex blade has nothing but a very few exceedingly small straight teeth. The peduncle appears to be fine brown. At the very base it is light green, with numerous brown spots, which alone strike the eye at a distance, and at the top on the zig-zag part of the inflorescence it is deep brown, with a few small light green dots. The flower exceeds in size more than twice that of *P. equestris* (rosea). The sepals and petals, of *amabilis* shape, are white, with some amethyst at the base of the petals. The side lacinie of the lip have a few brown spots at the base, and lilac stripes and tint on the middle and border. Middle lacinia ochre-coloured at the upper part of the base, lilac on the anterior part. Callus ochre-coloured, with a few brown spots. Nail with some brown spots, and a broken amethyst line over it. Back of column light amethyst.

It comes very near *Phalénopsis equestris* (rosea), and may have inverted parentage of *P. intermedia*.

Among my sketches of the first-named plant is one of a flower kindly sent by my excellent correspondent, Mr. T. Barber, in May 1881, which has nearly the same colours, but brighter.

Were it not for the white sepals and petals of distinct shape, for the top of lip, for the shape of the leaves, like those of *amabilis*, it might be asked whether this is not a giant *equestris* (rosea), which, however, it decidedly is not.

The plant is an introduction of Mr. S. Low, and would appear to be very vigorous from having four leaves at once. *H. G. Rehb. f.*

CYRTOPERA PLANTAGINEA, Lindl.

It is very gratifying that this old plant, published as *Limodorum plantagineum* by the venerable Aubert du Petit-Thouars, as early as 1822, and named by Dr. Lindley *Cyrtopera plantaginea*, in January, 1833, and nearly unrepresented in our herbaria, has finally flowered in Europe, I believe for the first time; but not in England, or in Belgium, but in the land of the Czechs, in Bohemia, in the garden of Baron Hrubý, under the care of M. Shopetz. It comes from Madagascar, where it was gathered by M. Leon Humbolt, and introduced to us by Mr. F. Sander. It has leaves nearly as in a *Calanthe*, and a long raceme of numerous flowers of moderate length, with long bracts. The sepals are light green. The petals are shorter, broader, white with a green border. The side lobes of the lip are dark bluish-green (as in *Kivulatia*, *Oscillatoria*, and such *Alga*), with brownish streaks over the nerves. Middle lacinia and disc white. Anterior numerous crests and calli bordered with fine mauve, the white back of the spur has also some mauve turning more to purple. Column lightest yellowish-green, with numerous longitudinal lines of small brownish spots. Crest of anther darkest purple. Pollinaria dimorphic: I found one just like that one represented by Dr. Lindley in his herbarium. The glandule is oberscent-shaped with short stalks. All the other pollinaria observed are crescent-shaped, with long finally bristle-like stalks as in *Scuticaria Steelii*, Lindl. *H. G. Rehb. f.*

RHODODENDRONS AT SINGLETON.

THE accompanying woodcut (fig. 108) is a faithful reproduction of a photograph taken of a Rhododendron at Singleton, near Swansea, and will be interesting, not only on account of the intrinsic merits of the plant, but because also, alas! it was so seriously broken in the great gale of last October as to necessitate its removal; we may, however, solace ourselves with the reflection that though the largest it was by no means the only example of this fine variety grown in Mrs. Vivian's gardens.

I believe that it originally came many years ago as a small seedling plant from Van Houtte, under the name of *campanulatum* hybridum, with some others of the same strain, which were called *campanulatum mobile*, *campanulatum robustum*, &c., but whatever may have been its parentage it was at the time of its destruction a handsomely furnished tree 20 feet or upwards in height, and its floriferousness may be well judged from the representation.

Speaking of this plant a year or two ago I heard Mr. Harris, who is in charge of the gardens at Singleton, say that he had known 200 trusses cut from of this one tree for the decoration of the neighbouring church at Sketty on Easter Sunday without their being missed—a statement then received as an exaggeration, but I, knowing Mr. Harris' accuracy and that I might depend on what he said, asked him at Easter, 1881, to count with me the trusses of bloom then on the plant: we found upwards of 1100, and then there were nearly 1200, but it was a difficult matter to reckon exactly.

But it is not for its size and floriferousness alone that it is so well worthy of notice. In judging the respective merits of the hardy hybrid Rhododendrons we are attracted by certain qualities of colour, shape, texture, habit, and size, which in our critical eyes give one variety pre-eminence over another; and bearing in mind Mr. Glenn's floricultural standard of what a Rhododendron should be—"that the individual flowers should be round, slightly cupped, large, well-spotted, smooth-edged, and thick; colour dense, and truss a bold round-sided cone; footstalks thick and elastic," and proceeding to compare the subject under notice with this description, or with the many other fine hardy hybrids which grow in luxurious profusion in this paradise for Rhododendrons—we may safely pronounce it to be one of the finest in cultivation. For each truss is large, conical, and handsomely set up;

each pip is large and full, of good shape and texture, and the colour is a good bright white, darkly and effectively spotted with rich purple. I fear that its early flowering habit would condemn it in the eyes of some of our fanciers, for modern Rhododendron growers aim at obtaining their blooms in May and June when comparatively safe from the bane of spring frosts, and they can describe their

NOTES FROM HECKFIELD.

Nor the least amongst the pleasures incidental to a spring look over the pleasure-grounds here, is that of noting the almost entire absence of injury to trees or shrubs consequent upon the recent hurricane. The grounds chiefly look north, and on the western and southern sides they are well sheltered by lofty trees and

and between the far-off trees—not so long since as green as painter could desire, but now truly a field of cloth of gold, so gloriously enriched is it with the brilliant Buttercups. Over this vista of golden sheen the cattle are ranging, whilst in the foreground the placid water glistening in the setting sunlight gives an air of freshness, yet of repose, that no words can pourtray.

FIG. 108.—RHODODENDRON CAMPANULATUM HYBRIDUM AT SINGLETON.

plants as hardy, and obtain a grand display of all their glories blooming simultaneously. But as this hybrid blooms at Easter, the end of March and beginning of April, it has a point of merit in my eyes as being one of those varieties which help materially, and which are so welcome, in prolonging the blooming season of the queen of our flowering shrubs by anticipating the main body and affording a foretaste of the glories to come later on in the season. *John T. D. Lewelyn.*

woods. Whilst in the ducal park of Strathfieldsaye, close by, the slaughter was heavy, at Heckfield the damage was *nil*. The encroachments of the gardener's art upon the wild woodlands still continue, and on the northern boundary of the vast lawn, a clean shaven expanse of some 20 acres, there have been fresh improvements made—fences set back, noble trees thrown open, new foot-paths formed, and new vistas of beauty created. Nothing more beautiful just now can be produced by art than is seen in the glade

Around us the noble Pines perfume the air, the Araucas and Rhododendrons, gorgeously arrayed in yellow, scarlet, and crimson, give abundant life and beauty to the heavy greens, so abundant in Nature, and yet so refreshing.

On the charming terrace the bedding which is, as all know, the most perfect of its kind when complete, is in rapid progress; and when finished and perfected it will be a thing of beauty, though its joy will only last the season. Within the walled gardens the fruit;

treers seem full of promise, Pears especially so. The vegetable crops are all that can be desired; and abundant cleanness and order of the most exact kind everywhere reigns, as indeed it should in all good gardens. If any one is pained at Heckfield, it will not be with its disorder—it will be rather with its excessive neatness.

VINES.—All readers of the *Gardeners' Chronicle* have in the past learnt of the house of Lady Downe's Vines here, in which the Vines being carried right over a span-roof had the points laid in the border on the opposite side, the Vines making here new roots and thus in a certain sense standing on their heads. The necessity of that renewal which all vineries must undergo somehow, has induced Mr. Wildsmith to cut away and root just one-half of the original Vines but leaving all that portion of the plants that were on the opposite side of the span, thus whilst practically planting half the house yet only destroying one quarter of the Vine area. The result has been that the halves of a dozen Vines now subsisting entirely through their head roots are doing just as well as they did before, and there is every prospect that they will produce an excellent crop. This instance is one perhaps of more interest to the plant physiologist than to the Vine grower, who does not often find himself able to follow this curious example. But in this house as well as in another where borders some 4 feet deep of fresh cut turves were made with the addition of the customary supply of manure, Mr. Wildsmith found such a generous warmth was promoted that he placed eyes into pieces of turf and secured them in the border—just where, were they plants, these would have been planted. The result has been a great success, the growth being vigorous and rapid beyond all anticipation. It is thus evident that fresh-cut turves contain when so employed considerable heating power, that has in this case been fully utilised. In the fruiting-houses Black Hamburgs just colouring are a grand first crop, and Muscat of Alexandria follows—these have finely set. Alwicks Seedling sets here most freely: whether it specially likes the soil or the culture certainly it is as free as any Grape can be. Some good bunches of Lady Downe's four months cut yet hang in the Grape-room, and thus the late Grape meets the early one in long and unbroken succession.

STRAWBERRIES.—It is a decidedly remarkable fact that, whilst in scores of gardens, where the growers are first-rate men, the Vicomtesse Hericart de Thury always fails in pots, at Heckfield it is always so very fine; in fact, it is a grand cropper both inside and out. Except on the score of soil, it seems difficult to understand this variation. The Vicomtesse and President are the only kinds grown, and, oddly enough, none others seem to do half so well. Pot Strawberries are indeed a fine crop; the plants are robust, full of strong leafage, and show as plainly as can be shown how closely robust growth and good crops are allied. It is the rule at Heckfield to set apart a plot of plants solely to furnish runners for potting, and these plants are invariably layers of the previous summer. From this plot all bloom is persistently gathered, so that runners shall be induced to form early. Still farther, as there is no exhaustion of the plants through fruiting, the runners come more abundantly, and when laid in the pots there is no danger to them such as follows when incautious gatherers have to get amongst them. "Early runners, and strong ones," is an excellent motto in obtaining pot-plants, and its value is most forcibly shown when the fruiting time comes. Mr. Wildsmith still adheres stoutly to the buffalo-horn manure, a very small portion of which is mixed with the potting soil. That it is full of nutriment for the roots there can be no doubt, and as the plants have to remain so long in the pots, its slowness of decomposition becomes most serviceable. Added to this stimulant, bi-weekly waterings of cow-manure water are given to the plants during the blooming and early fruiting season. The best proof of the benefits resulting from treatment of this kind is found in the splendid crops that follow.

CHLONOSTOMA HISPIDUM makes a charming plant for cool greenhouse decoration. It grows freely and requires no special effort for its successful cultivation. It forms a dense compact bush some 6 inches high, clothed with innumerable starlike whitish blossoms flushed with lavender. Good examples of this pretty plant are now in flower at Kew.

RABY CASTLE, DURHAM.

(Continued from p. 630.)

In a sheltered spot near these houses were beds of tuberous-rooted Begonias, very well managed, the growth stout and close, with plenty of flowers on them. At a short distance westward from this is the conservatory, a good substantial house in which the plants look at home, and seem to say they are satisfied—so different to the many structures one meets with that are put up for little beyond the appearance of the building, regardless of the unfortunate occupants that in them struggle out a lingering existence. A stage runs along the front over the pipes, which answers for low growing plants; the remainder occupy the body of the house, standing on the floor. An unusually fine lot of Oranges and Citrons stand in a row near the back path, with beautiful bushy pyramidal heads; they are from 10 to 12 feet high. With these are Tree Ferns, Palms, Camellias, Azaleas, Fuchsias, and general decorative flowering plants, as their season for blooming comes round are brought in. Fine-leaved subjects of smaller growth are freely used for mixing with the flowering things. There is a very good selection of climbers, which thrive well without doing serious harm to the other occupants, from the sufficiency of light which the house affords. Of these there are trained on the roof Clematis indivisa, Tacsonia insignis, T. Van Volxemi, Tecoma jasminoides, Bignonia species, Fuchsias, Plumbago capensis, Mandevilla suaveolens, which flowers profusely right up to the winter, and Bougainvillea glabra: all these were in excellent condition, although several times during the last severe winter the heat was down to little above freezing. On the eastern end of the house is the finest example of *Datura suaveolens* I have ever met with; it is planted at and covers the end completely, flowering three times a year. When I saw it there were hundreds of its great, sweet-scented, trumpet-shaped blooms open, literally lying in wreaths of an armful together, as much as nine or ten flowers hanging to many of the strongest shoots. This plant can never be seen in such condition unless planted out with plenty of room for its roots, and equally enough head space and light. The house is roomy, 85 feet by 24. Further westward there is a lean-to range, the first of which, 60 feet in length, is filled with Plums and Peaches; the former in front trained on a trellis sufficiently away from the glass to allow the standard Peaches on the back wall to get light; the Plums are Green Gage, Golden Drop, Jefferson, and Victoria, which, with the Peaches, are in good condition. Next is the early Peach-house, 45 feet long; here again the front treers occupy a trellis kept down low enough to let those on the back wall have sufficient light and sun to thrive well. These also are in excellent condition, full of young wood of the right sort; the crop was cleared, but the leaves were yet fresh and free from insects. Amongst other varieties in this house is Dr. Hoag Peach, which Mr. Westcott likes much for its ability to bear packing and carriage well, which is no slight consideration where fruit to supply a large family for a considerable part of the year has to be sent long distances. We now come to a vinery 60 feet long, the earliest house of permanent Vines forced, the first to come in being grown in pots, and which are ripe before the last of the previous year's fruit are over. This house has been planted ten years in an inside border, with plenty of room outside as well. The sorts are Black Hamburg, Muscat of Alexandria, Muscat Hamburg, Madresfield Court, Foster's Seedling, Mrs. Pince, and Golden Queen; when I saw them, the latter end of July, such portion of the crop that still remained was of very good quality. This house, as well as that in which the pot Vines are forced, is started the third week in November; no fermenting material is used on the border, and for the first time last winter the few inches of leaves put on in the autumn to keep out frost, but no more, had no further covering but the snow, of which, as most people are aware, there was no stint in this part of the country. Mr. Westcott showed me the shutters he used to cover his Vine borders with; they were piled up in the soil yard, and enough to load a railway waggon, so sound and in good condition that they are to be converted to another purpose. For the future nothing is to be put on the roots beyond what is useful to keep them from being frozen. To the north of this walled garden there is a block of houses and pits, the first of which is used for bringing on

plants for the conservatory; it was filled with such stock as tuberous Begonias and Fuchsias; on the roof, which they cover, are two of the finest examples of *Lapageria*, red and white, I have seen; they are planted out, and have attained unusual strength and size; they were just beginning to open their flowers, and will keep on giving a supply all through the summer and autumn. Where choice flowers that will last well when cut are wanted, there are few things that can equal these *Lapagerias* when they have got to a size that permits of their producing bloom in quantity. The adjoining house contains a mixed collection of stove plants and Orchids. Here in flower was *Peristeria elata*, unusually strong, bearing several spikes 7 feet high, the strongest of which had on it thirty-eight flowers; two very large examples of *Calanthe masuca* were also in bloom, a condition they are usually, more or less, nearly always in when strong, as they are here; these, and the *Peristeria*, are grown in loam. *Calanthe Veitchii* is well done, and present in quantity, both in pots and baskets. Amongst others in thriving condition were *Anguloa Clowesi*, *Cattleya Warneri*, C. Dowiana, C. Skinneri, C. Warscewiczii, C. Triane, C. Mendelii, C. Mossie, *Cyrtopidium Dominianum* × C. caudatum, *Phalænopsis grandiflora*, P. Schilleriana; *Scaccolabium guttatum*, S. Blumei majus, S. ampullaceum; *Acridis crispum*; *Lælia anceps*, L. anceps alba; *Vanda suavis*, V. tricolor, and *Dendrobium densiflorum*. A large plant of *Monstera deliciosa* was both in bloom and bearing fruit. The adjoining house is occupied by a miscellaneous collection of stove plants, which include a number of fine specimens of such things as *Crotons*, *Dipladenias*, *Anthuriums*, *Ixoras*, *Nepenthes*, with many others, and also a quantity of Orchids that occupy the front stage. One of the two next houses, which, like those already named in this range, are lean-to's, is now filled with a general assortment of winter flowering plants, including the best of such as are annually grown for the purpose. This brings us to the succession Pine-house, containing a quantity of stout young Pines. The kinds grown are *Charlotte Rothschild*, *Queen*, *Smooth* and *Frickly Cayenne*. Then follow two houses for fruiting Pines, in the first of which there was a lot of vigorous plants fruiting in various stages; some of the *Charlotte Rothschilds* would run up to 7 lb. each. Pot Vines are forced here stood on the back wall of the Pine-pit and trained over the back path, the construction of the house being such as to allow of their having plenty of room and light. After these are cleared out, young ones for fruiting the ensuing year that have been started elsewhere are brought in and stay until they are fully ripened up.

In the adjoining house many of the plants were in bloom—strong, stout-leaved examples, calculated to carry big fruit. This is the second lot, not long in here, following those that had been in for the London season, during which fruit and flowers are sent weekly. Here also the pot Vines for next year were stood, as in the preceding house, strong and well done; they are let to carry four or five bunches each, which they are calculated to finish well. Then at a short distance there is another succession Pine-pit, containing a beautiful lot of short-leaved plants. Whether or not this splendid fruit is getting less fashionable than it used to be, and its cultivation reduced or given up in many places, there is no sign of its being discarded at Raby; and, although the fruit of foreign growth are large and handsome to look upon, still those who want perfect Pines to eat will have yet to fall back on home-grown Queens or Black Jamaicas. There are numbers of pits for the propagation and growth of the many thousands of plants that have to be annually raised for various purposes—for French Beans, Cucumbers, Melons, and Strawberries, which latter fruit Mr. Westcott makes a speciality of, following the method of layering the runners in the pots they are to fruit in, not severing them from the old plants until the growing season is quite over.

Standing in an enclosed fruit garden at a short distance are four other vineries, about which there has probably been more said and written than of any others in existence—I allude to the houses which were built expressly with borders wherein to plant the Vines, made of materials such as it was expected would have given unusual results, but which so signally failed as to explode the mistaken idea held by some that because the Vine is a hungry plant it would feed upon and digest any sort of garbage. With this view the soil of which the border was made was mixed with large quantities of animal matter in a crude undecom-

posed state; no half measures were taken, and no expense spared in either the construction of the houses or the preparation of the border; but nevertheless the failure was complete, and after much time had been wasted the border and the vines also were cleared out and a fresh lot planted in more healthy material. The result of which has been the splendid Grapes that Mr. Westcott has for many years now grown in these houses: they are, as I have already said, four in number, each being 40 feet by 17; the borders as remade were all outside the houses, having a deep sunk path all along the front. This Mr. Westcott has filled up with suitable materials, of which the roots have readily taken possession, and the border is now to be increased so as to occupy the full inside space available. Entering at the west end, the first house is principally filled with Black Hamburgs, with a single Vine each of Gros Colmar, Mrs. Pince, Madresfield Court, and Golden Champion; these were carrying a beautiful crop, just beginning to colour. The next is mainly occupied by Lady Downe's and Muscat Hamburg, both of which were bearing an unusually fine crop; the latter variety is set by hand. We now come to a house chiefly of Muscates, with Royal Vineyard, Mrs. Pince, Gros Guillaume, and Golden Champion, represented by a single Vine each. Here also there is an excellent crop coming on. The last of the range contains Lady Downe's, Muscat Hamburg, and one or two Madresfield Court, and, like the preceding, it has a full even crop of handsome bunches, with every appearance of their finishing well.

The garden fronting this range contains a beautiful lot of Apples planted on each side of the walks round, and dividing the quarters; they consist of large bush and small standard shaped trees; when Mr. Westcott took them in hand they were too vigorous to bear, they were freely root-pruned, and their roots are now shortened a little every third year. The kinds which succeed best here are Blenheim Orange, Cockpit, Lord Suffield, Early Harvest, Dumelow's Seedling, and Mank's Codlin—these were bearing fair crops. Returning to the principal walled garden, the decorative portion of which has been already described, there are great numbers of Pears, Apples, and Plums, in good bearing condition kept within suitable limits as to size for a garden in which vegetables have to be grown; they occupy the sides of the walks in the usual way, and are also in rows across the quarters, and considering the season were bearing very well; Ribston Pippin in particular, on trellis, being full of fruit. On the walls there are good crops of Apricots, Pears, and Cherries; Plums thin; Morello Cherries there are by the bush. A long wall is covered with Raby Castle Red Currant, which gives a supply up to Christmas. The gardens inside the walls occupy about 10 acres. In common with other things here vegetable growing on an extensive scale is well done. The whole affords an example of a well-managed, old-fashioned garden, where nothing is attempted that would be incongruous with a fine old historic place such as Raby. T. E.

FLOWERS IN SEASON.

STREPTOCARPUS PAUCIFLORUS.—For greenhouse decoration this species is quite as effective in its way and quite as desirable as the well-known and much commoner blue-flowered *S. Xenii*. It is true the flowers are not so large, but they are freely produced and are very charming in colour—pure white, with a streak of deep purple on each of the three lower divisions, and a central blotch of primrose running into the throat. The foliage and habit resemble those of *S. floribunda*. Now flowering in No. 8 house at Kew.

ERITRICHUM NANUM.—Messrs. Backhouse of York were the first to successfully introduce and cultivate this lovely alpine gem. It is a diminutive member of the Boraginæ family, forming cushions of small hairy leaves thickly studded with flowers whose colour and effect are graphically described in the *Botanical Magazine* as follows:—"In intensity of colour, the blue of *Eritrichum nanum* is equalled only by that of the alpine *Gentians*, whilst it is of a much more azure hue than any of these, approaching most nearly to the deepest blue of the sky, at a point of the heavens opposite the sun's position, as seen on a cloudless day from the elevation the plant itself inhabits." It is a native of the whole range of the

Alps, and grows in stony places, always fed by snow rills, at from 6000—12,000 feet above sea-level. To one of the Kew plants the above description perfectly applies, whilst another (grown, however, more in shade and under somewhat different conditions) has flowers double the ordinary size, and several shades less deep in colour. A constant supply of moisture, thorough drainage, and a cool airy position seem indispensable to the well-being of this charming little plant.

DISCARIA LONGISPIINA.—This shrub is a native of Monte Video, and when grown under favourable conditions, such as those under which it thrives so well at Kew—the dwarf outside wall of one of the plant-houses—it certainly does not merit the remark in the *Treasury of Botany* that all the known species of *Discaria* "are spiny under-shrubs of no beauty." This is "spiny enough, but it produces leaves freely, as well as a profusion of white Lily-of-the-Valley-like flowers. Under less favourable circumstances it flowers sparingly, and leaves are scarcely developed, the green spiny branches, as in many of its relations, performing the functions and taking the place of the true leaves.

ARNEBIA GRIFFITHI.—At Kew a nice plant of this handsome *Boragaceæ* is now in flower. It is a form with shorter stamens than usual; in this plant the "five fingers of the prophet" (the dark blotches of the bright golden-yellow corolla) disappear rapidly. In some examples these only disappear ultimately, whilst in others, so we are informed by Dr. Aitchison, who has often collected the species in Afghanistan, they are quite permanent. A. Griffithi was first discovered by Griffiths at Cabul; it has narrower leaves, deeper yellow flowers, a differently shaped calyx and a longer corolla than A. echinoides.

RHODOENDRON VEITCHIANUM.—A fine plant of this very handsome *Moulmein* species, growing in a pot in one of the plant-houses at Bearwood, Wokingham, is highly spoken of by Mr. Tegg as invaluable for cutting from. The flowers are large, pure white, stained with yellow at the base, and finely crisped in the margins; and the trusses of bloom are found of great service for table decorations. As new forms of the *Rhododendron* are frequently introduced, it is well that older introductions of undoubted merit should not be wholly thrust aside in the attention paid to novelty.

ESCALONIA MACRANTHA.—That this charming and useful shrub is not planted extensively enough few people of experience will doubt. It has the merit of being all but entirely hardy out-of-doors anywhere in England, and given a favourable situation and a good climate to grow in there is no purpose which it will not answer by the exercise of a little skill in training. To begin with, its leaves are of such a deep dark green and of such substance that as a wall creeper the plant has an attractive luxuriance about it different from the majority of most plants used for the same purpose, and of course its beauty is further enhanced when in flower. As a rule, it is far too formally trained, the main shoots only should be fastened to the wall, and if there is a plant of *Clematis montana grandiflora* trained above it, so that the long shoots of the latter, covered with its beautiful white flowers, hang over the Escallonia, the effect is lovely. But the plant may be grown in any form; it makes a fine hedge, and as a "single bush specimen" it is not easily surpassed now that it is in full flower, and the gloss of its healthy leaves is conspicuous beyond everything else around it, not even excepting the beautiful *Weigelia rosea*, the flowers of which are more striking at a distance, but the leaves will not bear comparison with those of the Escallonia. As a cut flower, too, its red tube-shaped flowers are both useful and effective, requiring no further addition than a few of its own leaves to set it off to the best advantage.

GLOXINIA THE CZAR.—This very distinct variety with crimson flowers, now in bloom in Messrs. Veitch's collection at Chelsea, is quite distinct in colour, but more so in the form of the flowers. They are very large, of a purplish-crimson colour shading to purple at the edge. The segments of the petals are slightly fringed at the edges. When a flower of this kind is obtained distinct in colour and in form, and at the same time attractive in appearance, it ought to be used as a pollen-parent to cross other varieties. We require distinctness in form as well as in colour, and new breaks of this kind, even if they do not diverge far from the ordinary type, ought to be carefully watched, and seedlings should be obtained from them in various ways.

GLOXINIAS.

At the present time a very long span-roofed house in Messrs. Veitch's nursery at Chelsea is filled with a collection of the best-named varieties of the *Gloxinia*. It comprises all the varieties introduced during the last few years, and some very fine ones not yet sent out; most of them—indeed, nearly all—are young plants, propagated in the usual way from leaves of the previous season. The plants are placed very near the glass, and are shaded from bright sunshine. This matter of shading is of more importance than some gardeners are inclined to admit. Nearly every plant in existence should have as much light as it is possible to give it, when grown under glass; and the object of shading is to prevent their being injured by the sun, therefore permanent shading, either by painting the glass or nailing canvas on the roof, is to be avoided for *Gloxinias*, as having a tendency to produce long-stemmed, flabby leaves, and long-stemmed flowers, scarcely strong enough to support them in an upright position. This is one of the very best flowers for those who have small houses and limited space, and the effect of an arrangement of the very best varieties amongst the smaller growing Ferns, such as the *Adiantums*, is charming in the extreme.

They are as easily grown, too, as the zonal *Pelargonium*, and are scarcely more subject to insect pests than that easily grown plant. The best compost for them is good fibrous loam and fibrous peat, the loam rather predominating; add to this rotten cow-manure about a fourth part, some broken charcoal, and sharp silver-sand. To obtain a succession of bloom the first tubers ought to be potted about the beginning of January—the last of them in April. As soon as the plants appear above the ground they require liberal supplies of water, plenty of air without being exposed to draughts, and a temperature early in the year of 55° at night, rising 10° higher later in the season. I never syringe them, for even if the water is as pure as it is possible to have it it injures the foliage, and takes the fresh green appearance from it. A rather moist atmosphere is quite necessary to their making good growth, and producing perfectly developed blooms. The varieties that bear the flowers in an erect position are esteemed the most, although there are a few very beautiful varieties with drooping flowers. After carefully looking over the large collection I noted the undermentioned varieties as being the best of them:—

Coronet has very large well-formed flowers, very thickly spotted with purple on a white ground.

Christopher Columbus.—The flowers are large with a very wide throat, spotted freely with reddish-purple.

Bayard.—Very distinct flowers, $\frac{3}{4}$ inches across, each lobe of the petals has a horse-shoe marking on it of a purple colour, the flowers spotted light purple.

Mrs. Peplow has reddish-purple spotting in the throat; lobes of the petals spotted with bright red.

Lady Merritt.—A very distinct and good variety; the margin of the flowers white; the interior spotted red. The above are all of the spotted section.

Roxlane.—Amongst red, crimson, and scarlet forms *Roxlane* holds a high place; it is red with a white margin.

Radiance.—A large splendid crimson-scarlet variety; the best of this colour.

Lady Musgrave has flowers with a deep plush of lake in the throat; lobes of the petals crimson.

Sans Galois.—Throat lake with scarlet lobes, a very fine flowering variety.

Lord Derby.—Amongst the purple and maroon-purple colours this holds a high position. The throat is white; the lobes of the flower rich plum-purple, shading to purple.

James Barber has drooping flowers of a rich maroon-purple.

No Plus Ultra.—Very deep rich purple, shading to a pale purple at the margin; flowers quite $\frac{1}{2}$ inches across.

Lady Brook, purple throat, margin of the flowers white.

Purity is the best of the pure white varieties, the flowers are very large.

The above are the cream of the collection, but *Coupe d'Hébé*, scarlet, with white margin, and *Duchess of Connaught*, drooping flowers, bright scarlet, clear white margin, ought not to be admitted. They are now at their best, and the above with the unnamed seedlings are well worth a visit at the present time. It ought to be known, too, that seedling *Gloxinias* are very easily raised, and flower the same season that the seeds are sown. J. D.

Florists' Flowers.

PERPETUAL FLOWERING CARNATIONS AT MR. HOWARD'S, SOUTHGATE.—Varieties of Carnation with a natural habit of continuing to produce flowering shoots have long been grown by those who esteem flowers possessing the most agreeable perfume, combined with a handsome appearance. Yet their cultivation amongst those who have the charge of private gardens has until recently been confined to few individuals as compared with the many who grow other plants that possess much fewer properties to recommend them. Why it would not be easy to say, for they are not difficult to manage when once their requirements are understood, and fair attention is given them. They are essentially a gardener's flower where a continuous supply all the year round is wanted. In these days of button-hole flowers for both sexes there is one property they possess over almost all others, which is the length of time they will wear without falling to pieces or showing the effects of the knocking about inseparable from being worn in this way, their tough texture and ability to withstand the effects of crushing enabling them to bear usage that will destroy nineteen-twentieths of the flowers that admit of being used in button-holes. The tall spindly stems, with here and there a spare shoot, of which examples of the old varieties were usually composed, was not inappropriately expressed by the name, Tree Carnation, which they bore. But these attenuated forms were as different from the stout, compact habit, vigorous constitution, and profuse disposition to flower, possessed by the modern race of these plants as they well could be. Many years ago, when the growers of perpetual flowering Carnations were much fewer than they now are, Mr. Howard was amongst those who were most successful; now, when cultivating them for sale, his stock may be reckoned by tens of thousands in pots, and planted out in beds in the houses; one house, 16 feet by 32 feet, is wholly filled with them turned out in prepared soil. Amongst these, besides the pick of the older established kinds of home and also of Continental origin, there are a number that he has obtained direct from the most noted of the foreign growers, which, for their general properties, especially in the important matter of a dwarf, vigorous habit, that enables them to produce a greater quantity of flowers, are far in advance of the better-known sorts. Mr. Howard has himself gone largely into the raising of perpetual-flowering Carnations from seed in thousands of his own raising; there are several that make growth as strong and dwarf as the old crimson Clove combined with the requisite properties of form, colour, and a free blooming disposition, which collectively are indispensable to any variety that can be looked upon as an improvement on existing kinds. Not the least remarkable thing in Mr. Howard's seedlings is their extreme hardness; the past winter, although unusually mild, has been enough, coupled with the stagnation in vegetable life that always takes place in winter, to destroy almost everything in the shape of flowers formed in the autumn. Not so these Carnations; quantities of them out-of-doors, and transplanted right in the middle of winter, have been opening their autumn-formed buds from the middle of April all through the present month. As a matter of course, the flowers were small, but the fact of their living and opening at all in the open air is an evidence of their hardy nature.

HERBACEOUS CALCEOLARIAS AT ISLEWORTH.—It is always a pleasure to inspect Mr. James' superb collection of herbaceous Calceolarias from year to year, not only because the plants are always well grown, but because regular annual visits enable us the more thoroughly to test the diverse changes in hues and markings that now and then crop up. It is so very encouraging in relation to these beautiful spring decorative flowers to find them sturdy, robust, full of clean luxuriant leafage, and of erect compact habit, such as renders the support of stakes needless. The trusses are large and massive; in some cases the blooms are so big as to measure over 2 inches across, and yet of good form, for it must be admitted that size and form are now not always allied in the Calceolaria. In colours and

variety of markings there is abundance, self especially being prominent. The palest is a soft white, not pure but very nearly so, and, not of least importance, of stout habit; buff and rosy-white, both exceedingly striking; sulphur-yellows in shades down to orange—this latter a superb flower; buff, chocolate-buff, &c. Then all these hues forming grounds more or less heavily speckled and spotted with chestnut, red, maroon, and crimson, some of the finely-speckled forms being singularly novel and beautiful. A very rich marbled flower has a pale rose ground heavily marked with crimson-maroon. The dark selfs are very striking—one, a rich orange-crimson, glows in the setting sun like fire. Maroons, crimsons, reddish-cerise, and other colours make up the collection. Allied to the size of the flowers and their varied markings quality is kept well in view, and in this respect the flowers show a marked advance. Some plants, the earliest of the one sowing of last July, are 18 inches through, and fine specimens. These are in 24-sized pots. The soil is composed of good, sweet, turf loam in the greater portion, and the rest of well-rotted manure from an old Mushroom bed. The only other stimulant is occasional waterings of animal liquid manure as the plants develop bloom-heads.

The Rosery.

ROSE FORCING AT THE ASCOT NURSERY.—In these times, when nothing less than Roses all the year round will suffice with those who require the best flowers, it may easily be supposed that their cultivation under glass is one of the leading features at Messrs. Standish's. The planted-out system of treatment is here in full swing, carried out somewhat differently than in most places. In each of the long, 20 feet wide span-roofed houses, where they are thus grown, there is a broad centre pit running the whole length, formed in the usual way with brick walls, and filled with soil; in this the Roses are planted on each side, just within the pit walls; the two rows of plants are trained with their heads to meet each other, forming an arch over the pit about three feet under the glass; in this way, as will be easily seen, the greatest amount of leaf surface is equally exposed to the light—the strong growths that are annually produced from the base of the plants when thus bent push out quantities of stout flowering shoots all up their length. The casual observer might not see that much was effected by this form of training, but where the plants are turned out in the soil, and gain, as they do, plenty of strength, yearly renewal with vigorous shoots which the arching over of the heads causes to spring up from the bottom, that in their turn when bent down push up flowering wood from the eyes all their length, produces the maximum quantity of flowers, individually larger in size than to be had where the plants are allowed to stand in their natural erect position. The principle and its results are similar to that under outdoor culture, where the shoots are annually pegged down. The main points in Rose cultivation under glass here are unstinted supply of water to the roots, with rich feeding, and a small admission of air until the flowering season is over, and the little air which is given is admitted at the ridge of the house. Those, in private gardens, who may have to make a beginning at Rose forcing, will do well to note this total exclusion of side air practised by the most successful growers for sale, who well know the certain attacks of mildew which immediately follow its admission. When the season's flowering is over about the end of June, the side lights are removed altogether and a considerable part of the glass from the roof as well, with still an abundance of water. Nothing could be more satisfactory than the condition of these Ascot Roses, with the uniform vigour of the plants and the unusual quantities of full-sized flowers which they produce. Not the least desirable feature in this arch method of training the tops is that it encourages the annual production of big shoots from the bottom of the plants, which permits of all the weaker and superabundant wood being yearly cut away. The propagation and cultivation of pot Roses is carried out here on an extensive scale, especially the best Tea varieties and others suitable for forcing.

FRUIT NOTES.

THE ALEXANDER PEACH.—We are indebted to the kindness of Mr. Rivers for the opportunity of illustrating the Alexander Peach (fig. 109), which seems to be destined to become a very popular sort. Mr. Rivers states that he received it from America some years ago, and experience proves it to be, perhaps, the earliest variety in cultivation. In a cold orchard-house it ripens a week earlier than Early Beatrice, and is double the size of that variety.

A NEW BLACK GRAPE.—Mr. Tegg has this season fruited at Bearwood what he and other competent authorities believe is likely to prove a valuable acquisition to our early Black Grapes. A graft of it was brought from America and worked on to a cut-back cane of Black Hamburgh. It has fruited this season; the bunch partakes somewhat of the character of the Black Hamburgh, the berry is of similar shape, and coloured black with a dense, blue-black bloom, and the flavour is peculiar, partaking somewhat of the flavour of the Melon and Strawberry in combination. At present the branch, which is quite a young one, carries but two bunches; but it is Mr. Tegg's intention to have it more numerously represented next season. He has great hopes of his *triticis*, and hopes to submit it to the Fruit Committee of the Royal Horticultural Society next year.

MELON LOCKINGE CONQUEROR.—This is a new scarlet-fleshed variety, raised by Mr. Joshua Atkins, The Gardens, Lockinge Park, Wantage, and exhibited at the meeting of the Reading Horticultural Society on the 18th inst. It was raised from Hero of Lockinge, white-fleshed, crossed with Hero of Bath, scarlet-fleshed. It is a large-sized, roundish, handsomely shaped fruit, beautifully netted, scarlet-fleshed, and exquisitely flavoured. It promises to be a valuable addition to the scarlet-fleshed class.

FORESTRY.

(Continued from p. 538.)

THINNING.—The subject of thinning, as introduced in the last article, is in the writer's estimation of such immense importance as to justify some further remarks. The Scotch Fir (*Pinus sylvestris*), whether regarded from its importance as a tree, a crop, commercial or industrial product, demands special consideration in regard to thinning. It is generally admitted to be the most extensively planted tree in Great Britain (certainly in Scotland), and is justly esteemed both on account of its commercial and industrial value, and its adaptability to a greater variety of soils, and situations (especially that of the poorer description) than any other forest tree, and from these and corresponding circumstances has arisen the saying, almost amounting to a proverb, "Thriving like a Scotch Fir."

Although this is substantially true, it is not absolutely correct, for there are soils here and there to be found, though comparatively rare, capricious enough to refuse even to grow the proverbially hardy tree. It is, however, on account of the richness and not the poorness of the soil that the tree refuses to grow in it.

Thinning is the lever power in the hands of the forester, of immense importance, power, and command, by which a crop of Scotch Pine may be made profitable or unprofitable, good or bad, according as that power is wielded.

It is still far from being universally known, that although gravely, sandy, and dry soils generally are the best, and most adapted to its growth, yet upon such soils where the best crop should be grown, the very opposite results are brought about through injudicious and inopportune thinning. The writer could point to hundreds, if not thousands of acres of Scots Fir plantations in Scotland where the market value no less than other work has been diminished by from one-third to one-half, and in some cases considerably more, on account of thinning being done at the wrong period of growth. The terms injudicious, improper, inopportune, and such-like, though familiar to the ear, yet convey no distinct idea, nor point out what should, or what should not be done by way of thinning, and therefore it is all the more necessary to make the subject clear, and explicit as far as can be done.

One principal reason why thinning is rendered

such an immense power for good or evil is in consequence of the change of temperature it produces upon the soil. When trees are planted in their young or seedling state, they, like most other things when young, readily adapt themselves to circumstances, such as soil and situation, to which they have been transplanted, and by progressive but imperceptible degrees they grow up, expand, and gradually shade and completely cover the ground till not a ray of the sun directly reaches it. The branches and foliage of a plantation constitute a sort of canopy whereby the surface of the ground is completely shaded from the rays of the sun, and consequently never even during the hottest weather does the ground become heated. That is to say, the ground in a plantation is less heated in hot sunny weather in

little effect upon an extensive country, but when hundreds of square miles are covered from the face of day so that neither light nor heat reaches the soil for ages in succession the results cannot but be immensely great, extending far beyond what even the imagination can conceive of. It is from this cause that springs, streams, and rivers that have flowed uninterruptedly for generations through the shady forests of foreign lands are all on a sudden dried up when the trees are removed, and the inhabitants forced to change their abodes for want of water even to drink.

On the Marquis of Lothian's estate in Roxburghshire an extensive Scots Pine plantation was formed, and as it grew up and shaded the ground a damp part in the plantation gradually became a spring of considerable strength, so much so that a gamekeeper's

thinning) effects the most hurtful must necessarily be the consequence. When a single tree is cut down, the roots of all the other trees around it do to a certainty suffer.

If the trees, when thinned, are young, vigorous, and full of sap, they in a comparatively short time recover their wonted luxuriance and vigour of growth, but if considerably advanced in age the recovery is much more protracted or a fatal result ensues.

An example of the injurious effects of thinning a Scots Fir plantation came under the writer's observation in Morayshire a few years ago. The plantation was between thirty and forty years old, and the soil a dry gravelly one, with a herbage covering of heather. At about twelve years old it had received what appears to have been a fair thinning, rather under

FIG. 109.—THE ALEXANDER PEACH. (SEE P. 704.)

summer than it is, where there are no trees, and in winter it is warmer in the plantation than outside of it. Every person knows that it is cooler and more enjoyable to sit under the shade of a tree, on a hot summer day, than under the direct rays of the sun, and the footsore and weary traveller can cheerfully testify to the relief he experiences and the joy afforded him by the shade of a spreading tree across his path. If any one wishes to experience the great difference between the temperature of the soil on a hot summer day under the shade of a tree, and that beyond it he has only to walk leisurely along and, with his eyes closed, though walking in thick-soled boots, he will at once feel and determine the limits of the shady part. This being clearly revealed, the whole subject is made known and the cause fully explained.

The shading of the rays of the sun from a few acres or even miles of ground may produce comparatively

house was built near by for the sake of the water. By-and-by thinning was done, and afterwards cutting the wood for estate purposes, till the fine old plantation was nearly all cut, during which time the spring was as gradually falling off as during the plantation's growth it was increasing and gathering strength and volume. On the same estate, and distant from the above some 3 miles, was another well, which also increased in strength as the plantation thickened around it, and again decreased as it was thinned and cut down. It is generally, though not universally known, that the roots of trees spread underneath the ground much in the same way as the branches do above it, and it requires no stretch of imagination to conceive how the roots thus formed and developed in the cool shade have thus acquired such a constitution and habit that if changed or altered in any important way (as is done in the act of

than over-done, and probably no other thinning had been done till shortly before the time I saw it. The appearance it presented at the time was that of a very sickly slow-growing plantation; the foliage was short, clustered, and of a pale light colour. The forester in charge became alarmed at the appearance of the trees, thinking they were all about to die, and was not a little cheered when assured that it was the effects of recent thinning, and that if he allowed it to remain undisturbed for a few years it would again recover. The injuries inflicted were through the roots becoming dried up, by reason of the heating of the ground. What I recommended was, in the first place, to cease grazing in the plantation, so as to allow as much herbage to grow up as possible, and also to allow the branches to remain upon the ground, for the purpose of retaining moisture and producing even a little shade. Plantations of this sickly mishinned descrip-

tion are unfortunately too common, and may be met with almost any day, and it is therefore strongly recommended that those whose interest is at stake in such matters should make it known to others as far as they can. *C. J. Michie, Cullen House, Cullen.*

(To be continued.)

Notices of Books.

A Manual of Indian Timbers; an Account of the Structure, Growth, Distribution, and Qualities of Indian Woods. Prepared by J. S. Gamble, M.A., F.L.S., Officiating Conservator of Forests, Bengal. Calcutta: 1881.

In the last Great Exhibition held in Paris in 1878 a very extensive and complete collection of Indian woods was shown, which at the close of the Exhibition was presented by the Indian Forest Department to the Forest School at Nancy; a duplicate set, however, was about the same time presented to the Museum at Kew, where, together with specimens previously contained in the collection, the series of Indian woods is probably unique—specimens of the most valuable or of widely distributed species being shown from the extreme ranges of growth, and it is remarkable to notice that while in some species the woods are very similar from different altitudes or positions, in others they are wonderfully distinct. As an illustration of the work undertaken by the forest officers in preparing these specimens of wood it may be stated that "the number of specimens named, numbered, and described" amounted to 2536, belonging to 606 species and 432 genera.

In Mr. Gamble's very lengthy introduction he says—"In order to explain more definitely the sources from which the original Paris Exhibition woods were obtained the following extract from Dr. Brandis' introduction to the catalogue of specimens of forest produce sent to that exhibition will be worth quoting." From this it seems that the orders for the preparation of the collection were received in August, 1877, "and as it was necessary to despatch it early in February, 1878, so as to be in time for the exhibition barely six months were available to bring together specimens from all parts of India, and to prepare and name them." This work of supervising the preparation of the specimens was undertaken by Dr. Brandis, and Mr. J. S. Gamble. A workshop was forthwith established in Simla, and a large number of pieces were collected from the hills in the vicinity of that place; the work was afterwards transferred to Calcutta.

The arrangement of the *Manual* is somewhat after the plan of Brandis' *Forest Flora*, but in place of the botanical description of the plant, as given by Brandis, a minute description of the wood is here recorded. Opening the book haphazard, we alight, for instance, at *Æsculus* in the order Sapindaceæ. First, we are told that the genus contains two Indian species, and thus the European Horse Chestnut is *Æ. hippocastanum*; then follows a kind of generic description of the wood, which tells of its colour, density, character of rings, pores, and medullary rays. Then under *Æ. indica*, *Colebr.*, we find references to Hook, *Fl. Ind.* and Brandis; then the English, *Trans-Indus*, Kashmir and Hindustani names; and following this we read "a large deciduous tree, bark grey, with long horizontal cracks, exfoliating in long flakes, wood white, with a pinkish tinge, soft, close-grained. Annual rings marked by a line, and sometimes by fewer pores in the autumn wood. Pores very small, medullary rays very fine, very numerous."

The distribution of the species is stated as North-west Himalaya, between 4000 and 10,000 feet, from the Indus to Nepal. The weight per cubic foot is next stated, and the various uses to which the wood is put, as well as other uses enumerated, for which the tree is valued. The numbers by which the specimens in the collections can be identified, and the place of collection completes the information given with each species.

The extracts here given are fair samples of what the book is composed of. In some large genera, however, as in the case of the Maples, a comparison of the species is made by the leaves, prefaced by a note that "the species may thus be distinguished by characters taken almost exclusively from the leaves." The arrangement of the natural orders is on the plan of the *General Plantarum*—so far indeed as that work had proceeded at the time the *Manual* was written.

This book, we have no doubt, will be very valuable

to young foresters on account of the careful description of the woods of the several species; we cannot but think, however, that some of these are unnecessarily lengthened, and consequently are calculated to increase the difficulties of many students. The work carried out by Mr. Gamble and those associated with him has no doubt been a task of some difficulty; but when so much time and attention had been bestowed upon a volume, it seems strange that the *addenda* and *corrigenda* should extend to thirty pages.

The books are furnished with a set of good indices—always points of very great importance in books of reference. Thus we have first an index to European names; secondly, of vernacular names; thirdly, to numbers of wood specimens; and finally, a good one to scientific names.

Orchid Notes and Cleanings.

CYPRIPEDIUM MASTERSIANUM, in flower at the present time in Messrs. Veitch's nursery, is a very distinct species. The flowers are of a very stout substance; the dorsal sepal greenish, with creamy margin, the lateral sepals of a cinnamon tint, with a brownish lip.

PHALANOPSIS SUMATRANA, of which there are several forms in flower in the same house, is a very distinct and remarkable species, with cream or pale yellow sepals and petals, spotted and marked with cinnamon. The lip is very pretty, owing to its slightly hairy violet-purple crest.

MESSRS. VEITCH'S ORCHIDS.—In the Cattleya-house there are some very fine forms of *Cattleya Warneri* in flower, and a really splendid form of *C. Mossie*. The original Syon House form of *C. Mossie*, from the late Mr. Sigismund Kucker's collection, is also in flower. The flowers are of a uniform pinky-white, and a remarkable characteristic of it is the want of any lip, its place being supplied with a large white petal. It always flowers in that way at Chelsea. In the cool Orchid-houses in this nursery are some very fine forms of *Odontoglossum Prescottii*. The finest varieties of this are not surpassed by *O. crispum* when at its best. The importation in which the finely spotted variety *Veitchii* was found has produced many fine varieties. *Masdevallia ignea* is also remarkably fine as a species, and the varieties of it are very numerous, some of them being very bright, others pale, and of a decided yellowish tinge. The best forms of *M. Harryana* are not equalled by any other species yet discovered, it is so free in growth and in flower. *J. D.*

BLUE-BOTTLE FLIES AND ORCHID FLOWERS.—Having noticed the spurs of the *Angraecum falcatum* eaten off, and also the bloom occasionally, I by chance found out the reason. When in our East Indian diet last Friday evening I saw a common blue-bottle fly on the spur. I watched him narrowly, and saw the whole operation—eating the tissue away, and extracting the honey. This may prove useful to growers who have lost their blooms, for doubtless the flies are the enemies in summer to the small blooms when we debit the beetles, &c., with the damage. These flies, when seen, should be killed in the houses, if possible, by honey-traps, &c. *D. B. Crawshaw, Sevenoaks.*

DENDROBIUM PULCHELLUM.—In the Orchid collection at Kew this pretty *Dendrobie* is now flowering freely. It is a charming little plant with short leafy slender pseudobulbs and delicately coloured flowers, the sepals and petals being a deep blush, and the beautifully fringed, shell-shaped lip deep orange-yellow, margined with blush. After the growth is made, and the flower-buds formed in this species, water must be withheld or the flowers are not developed.

FENNEL BY THE WAYSIDE.—This useful herb, which is by no means plentiful in many cultivated gardens, is found abundantly by the wayside in Devonshire, where it luxuriates without molestation by the sides of the commonest thoroughfares. Between Stavros and the village of Powderham it is growing in clumps and masses not more than a quarter of a mile from the railway station of the former place, which is frequented by large numbers of people every day in the year. That so useful a herb should be found plentiful in a place so public seems—to say the least of it—strange. The inference is, that the inhabitants of the neighbourhood do not use much molasses in the season; or, if they do, they are not as fond of the sauce as people living in a cooler atmosphere. Tansy is also to be found growing upon the cliffs near Dawlish.

The Kitchen Garden.

ALTHOUGH the temperatures which have been registered on several mornings were alarmingly near the freezing point, a circumstance which caused gardeners considerable anxiety at night as to the safety of their Potatoes, French Beans, and Runners, no injury has, as yet, been experienced in the direction apprehended. If Winter Greens are not already pulled up, the soil shaken off their roots and removed to the refuse heap, no time should now be lost in doing so, and in getting the ground manured and dug, so as to be in readiness for other crops, such, for instance, as Peas (of which a good sowing of the *Victoria Marrow* and British Queen type should be made forthwith), Broad Beans, Spinach, &c.

TRANSPLANTING ROOTS.—Advantage should be taken of showery weather to proceed with the thinning and transplanting of Onions, Beetroot, and Parsley—an operation that should always, when an opportunity is given for its being done, be carried out during showery weather, because then the young plants not only draw and transplant better and with more expedition, but are obviously less subject to check than if performed when the ground and atmosphere are dry, indeed such work should not under such a condition be proceeded with. The *modus operandi* adopted by ourselves, and perhaps by many others, in the thinning and transplanting of the above roots is a simple one; but nevertheless it is a mode of procedure that is not so well known, and consequently not so frequently practised as the advantages under certain conditions to be derived by its adoption entitles it to be, and is as follows:—

ONIONS.—AS soon as the young plants are large enough to handle, and the nature of the weather permits of its being done, they are thinned to 3 or 4 inches apart in the row, and the blanks, if any, are filled up as the thinning is proceeded with, taking care in planting that the holes are made deep enough, that the fibrous roots may not get bent in the transplanting process, and that the bulbs are not buried deeper in the soil than they had been before. I am aware that most growers allow a greater space between the individual Onions than we do, with the obvious intention of obtaining larger bulbs; however, for all ordinary purposes, 3 or 4 inches between each bulb in the row will be amply sufficient, and it is perfectly astonishing the size to which Onions, pushing each other out of the way as they grow into the 12-inch space between the rows, will attain. Moreover, I find that medium-sized Onions keep better, and are more economical than larger ones. In thinning the crop we leave half-a-dozen of the outside rows to be thinned as required for immediate use.

BEETROOT.—Half our crop is some seasons obtained from transplanted plants, which in every particular are as good and as well grown as those not so treated. The one essential point, assuming that the ground is of the right description and has been properly prepared for the young roots, as in the case of seed, is to make the holes deep enough for the young roots to be transplanted in their entirety, and about the same depth in the soil as they were before, without being curved in the process of transplanting, as in that case deformity of root will be the result. The advantage above referred to consists in this—that the treatment of the roots is accommodated to existing circumstances, which will admit, say, of ten rows being sown at the proper time; the whole space which it was intended to crop with Beet being then, and for a month or six weeks afterwards, occupied with other crops. Thus subsequently, when the ground is ready, and from the same sowing, we transplant fifty rows without in any way detracting from the value of the crop. The same course, if rendered necessary through the force of circumstances, might also be applied with equal advantage to Onions, always providing that the transplanting process is carried out with care and at the proper time, when the bulbs and roots are quite young and the ground moist, and that the plants are subsequently attended to with water at the roots until they have well taken hold of the soil. Parsley, too, through some cause or other, is not so generally transplanted as it deserves to be; not but it will, like the Onions

and Beet, do equally well if the necessary number of rows is sown at one time, but as a matter of economy—a fact not to be lost sight of in horticultural pursuits—a small patch of seed could be sown about the first week in March, and two months later the requisite number of rows transplanted therefrom, which plants will grow freely, and exhibit as little tendency to run to seed as those sown and afterwards thinned out to the proper distance in the rows—6 or 7 inches from plant to plant.

LEEKS.—This in some places is an important crop, and in many gardens it might be rendered so by giving it more attention, and consequently better cultivation than it generally receives, and which its merits as a culinary root unquestionably entitle it to. There are various modes of transplanting the Leek: the following is the one practised by ourselves, and which we have found answer very well indeed, viz.: in an open-well manured, and deeply-dug piece of ground, drills are drawn similar to those made, for Peas, about 16 or 18 inches apart, and in these, holes of 2 or 3 inches in diameter are made, 9 or 10 inches asunder in the rows; in these the plants are placed upright, and at the time of planting sufficient earth is allowed to fall into the holes to cover the roots, and subsequently the soil is gradually washed into the holes by the rain and by frequently Dutch hoeing between the rows, care being taken not to bury the hearts of the plants in doing so until the holes are filled. When the Leeks are planted water should be given them, and occasionally afterwards until the plants have taken hold of the soil, after which they might, with considerable advantage to the plants, have an occasional application of liquid-manure at the roots. Thus grown, large and well blanched stems are obtained. We have also grown the Leek satisfactorily in trenches prepared similarly to Celery trenches, and the soil drawn to the plants as they increase in growth and until the trenches are made level with the rest of the ground.

Make a sowing of Rosette Colewort for winter use, and as soon as Celery plants from the second sowing become fit for planting out let them be transferred to the trenches prepared as recommended in a former Calendar, and planted in the way there described. *H. W. Ward, Longford Castle Gardens, Wilts.*

NOTES ON VEGETABLES.

KIDNEY BEANS.—Of these there are a great number of varieties, but among them all there are none equal to the Scarlet Runner, and the best form of these is Carter's Champion, which has broad long pods that are very tender, and of a delicious flavour when cooked. London market gardeners and others grow Scarlet Runners in rows about a yard apart, without sticks; but, really as they bear when so treated, they afford the best results when allowed to climb in their own natural way up stakes, which should not be less than 6 feet high; and if the bines are stopped once they branch out and produce a great number of blossoms. To get these to set freely it is necessary that the ground be prepared before sowing by being trenched or dug very deep, so that the roots may be enabled to get well down; and if the rows are then mulched by laying a good dressing of half-rotten manure along their sides, the plants will bear prodigious crops. To enable them to swell their pods without check or suffering they should be heavily watered at least once a week during hot dry weather, and if they can have a soaking of sewage occasionally all the better, as that will be a great help by the stimulating effect it will have. The most economical way of growing Scarlet Runners, so far as land is concerned, is to have the rows wide apart, and plant Celery between, by doing which both are benefited, as the Beans are fully exposed to light and air, and under such influence they are very fruitful, and bear from base to summit. Thick sowing should be avoided, as the plants only choke each other, and there is nothing gained by having them nearer than 6 inches, which is quite near enough, and in rich ground they may with advantage be planted even farther apart than that. A sowing made any time from now up to the middle of June will come on and continue in good bearing till destroyed by the frost. Although the dwarf French Beans are not so tender and delicious as the Scarlet Runner, they are preferred by some; and if any are grown choice should be made of the Canadian Wonder, which bears pods from 6 to 9 inches long, and is a very free and con-

tinuous cropper. As this sort is a strong-habited kind it is necessary to have the rows a yard apart, and to plant the Beans 6 inches asunder; and when they are up it is quite worth while to give them a few brushy sticks for support; as, being tall, and having a good deal of leaf, they are apt to get blown down by the wind. The Long-podded Negro is also a good Bean, and so is Carter's Long Sword; but for quality neither are equal to the Canadian, which is the finest among the French sorts. Like the Scarlet Runners, these all require deep rich soil and a warm sunny position, and unless so favoured they seldom do well. *J. S.*

SUTTON'S LATE QUEEN BROCCOLI.—Since the beginning of April until now we have been cutting beautiful heads of this fine Broccoli. The seed is generally sown about this time, and it never fails to flower at the proper time. In this respect, and also in retaining its original type of character, it differs from most other kinds; of almost all Broccoli we have had several "strains," but this has always been good and true. Probably this may be accounted for by Messrs. Sutton always keeping the true stock in their own hands; and it is well worth taking care of in this way, as it has no equal among late spring Broccoli. The plants grow very compactly, and may be planted 18 inches apart each way. We have never seen one of them killed by a severe winter, or fail to head through any cause. It should be largely and universally grown. We would as soon think of being without Peas and Potatoes in our garden as this Broccoli. *J. Muir.*

Plants and their Culture.

NEW PLANTS AND NOVELTIES.—At this season of the year many of these (especially among stove and greenhouse plants) are distributed by the trade growers. These being purchased at an enhanced price to that charged for older kinds, it is incumbent on those who have charge of the same afterwards to pay every attention to the well-being of these subjects. They should have the best position that can be given them, but care should be taken not to over-protect, especially at the outset. Many a fine new plant falls into bad repute early in its career through not receiving the attention it deserves. Instances are also often seen where under good cultivation many new and choice plants have greatly improved in character. It should also be borne in mind by the purchaser that new plants are (or ought to be) shown in their best possible condition by those who hold the stock of any given kind. The finer the novelty the more severe will the stock have been propagated; those, therefore, who buy the same must in many cases exercise great patience before these young plants will equal either in the quality, foliage, or flower, that of the parent stock as seen when first exhibited before the public.

STOVE PLANTS.—These, where growing under conditions congenial to their healthy development, will soon be getting somewhat crowded. Some of the hardiest can now be safely removed to a cooler house with a night temperature 7° or 8° less than that accorded to the general stock. Of these, several of the *Falsus* will be found to do equally as well (not, however, *Verschaffeltias* or *Phenacophorium*). For want of a better place part of the stock of *Eucharis* may be shifted into the vineries, where those Ferns that love a dry atmosphere may also be grown during the summer, such as *Gymnogrammas* and *Nothochlidenas*. *Anthuriums* likewise that are grown for the beauty of their flowering spathes will last in perfection much longer in a temperate house when these are perfectly developed. The stock of winter flowering plants should now have every attention given them; young stuff already struck should be potted on as they require it, performing this operation before the same have become starved in cutting pots. More cuttings should also be inserted, especially of such as *Euphorbia jacquiniflora*, *Centropogon Lucayanus*, *Hegonia insignis*, *Eranthemum*, *Plumbago rosea*, and *Scutellarias*, also *Thyrsacanthus rutlandii*. The general stock of *Poinsettias* should also be started soon and a few

cuttings struck at intervals between this and August next. Seedling stuff of *Aphelandras* of the dwarf section should also receive attention, these will make better plants than cuttings. *Gesnerias* may be potted singly or three in a pot as soon as they are in fair growth.

FERNS.—Plants of *Adiantum cuneatum* that are well clothed in foliage should have abundance of water; occasional doses of weak guano-water will be found beneficial. Large specimens of Tree Ferns that are carrying large heads of fronds should have liberal supplies, in fact they may be watered *ad libitum*. Nothing is more grievous than to see their fine fronds disfigured through drought. Thrips will also attack some kinds if the syringe is not kept at work. We make it a practice to keep *Gleichenia flabellata* syringed also, belonging as this does to the *Mertensia* group, which require more moisture overhead than is accorded to the true *Gleichenias*. *G. dichotoma* will also thrive amazingly in a damp atmosphere that would be prejudicial to such as *G. Mendelii* and those nearly related to it. See also that *Pteris scaberula*, *Hypolepis distans*, and the *Cheilanthes* have free supplies of water; all these beautiful Ferns will be disfigured for the season if allowed to suffer even for a short time. Any stock of seedling Ferns in small pots should have a shift into a size larger unless they are intended for special purposes in the smaller size.

GREENHOUSE.—The latest *Spiraea* (*Hoteia japonica*) will open their flowers of a purer white if they are now brought under cover. The Paris *Daisies* (*Chrysanthemum frutescens* and the variety *Etiole d'Or*, and others) make most useful decorative plants, and will be found valuable, if worked as a succession for the conservatory to follow *Pelargoniums* and *Fuchsias*. It would be advisable to give the benefit of a shift to any that are become pot-bound, and feed those liberally that are not potted. The winter stock of *Chrysanthemums* should receive their final shift as soon as possible; if allowed to become starved they would soon lose their bottom leaves, which ought to be kept in perfect health as long as can be. When potted, stand them in a nice open position, and far enough apart for abundance of air to circulate amongst them; also see that the sticks are in advance of the growth of all grown on single stems. *Salvias* also that are grown for autumn and winter display must receive attention; do not let them become drawn, an occasional pinching will prevent this in a measure. Later on they may be turned out of pots, if it is necessary to economise labour, otherwise it is hardly advisable. Keep watch also on the stock of *Bourvardias*, *Tree Carnations*, &c., for next winter's bloom; should any aphid attack them, check the same at once. Pay close attention to the watering of all Cape and New Holland plants now in flower and advancing towards that stage; do not allow any to suffer for want of water, or the flowering period will be shortened or crippled, and weakly flowers will be the result. *James Hutton, Gunnersbury House, W., May 25.*

Peaches and Nectarines.

EARLY HOUSES, if treated according to the directions given, will now be opening their fruit, and should still have a very free circulation of air. With the splendid sunny weather we have had of late, fire-heat in the daytime may be dispensed with, only using a little at night, and on dull, cold days, to allow for a nice circulation of air. Look the fruit over on alternate days, and gather most carefully all that are ripe enough, never letting them get dead ripe on the trees; by so doing, many fruit are often spoiled by falling off. When gathered, I always place them in a cool fruit-room on two or three layers of cotton wadding covered with paper. If very carefully handled they will keep in good condition a week or ten days; I have kept them a fortnight. The fruit in the second house will now require exposing to all the sun and light possible by means already given for early house. Give copious waterings of tepid manure-water as the trees require it. Thud and succession-houses will now be stoning, and the principal work in them and late houses for the present will be thinning fruit, tying in young shoots, stopping any strong gross ones that are taking the lead. Syringe the trees very freely twice daily, and keep the roots well supplied with water—tepid for succession-houses, and cold for late ones. *J. Walls, Kew Gardens.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, May 29 { Great Show at Manchester continued (see 6945).
WEDNESDAY, May 31 — Flower Show at Kingston-on-Thames.
THURSDAY, June 1 — London Society meets at 5 P. M.

SUCH rapid progress has been made with the new ROCKWORK AT KEW that it is already partly planted. We have previously alluded to its general character and disposition. The lofty banks and mounds which encompass it are now planted with low masses of *Rhododendron ponticum*, with *Box*, or with, here and there, groups of effective plants like *Lawson's Cypress*. We are glad to see that the common mistake of planting shrubs that either are or soon will be too large for their position has been avoided, and that the dwarfing of the rockery so produced will be avoided. So steadily has this been kept in view that there are spots where even taller shrubs of more pyramidal habit might with advantage be employed—as, for instance, on one mound, where, from a certain position, the towering shaft of a Lombardy Poplar rises to so great a height directly over the rockery (although in truth at some distance from it), as to need the intervention of a shrub of similar habit and smaller height to prevent the abrupt appearance consequent upon the eye passing directly from the rockery to the Poplar.

The rockery itself is partly composed of stones suitably arranged with less ugly formality than is sometimes seen, and, if we may be pardoned the hibernicism, of roots and old tree stumps. As things are at present we pass from rocks to roots, and then again to rocks. It would, we think, have been a preferable arrangement to have had all the roots on the eastern side, all the rocks on the western side of the ravine, and thus have produced two well contrasted effects: the intermixture is not satisfactory to the eye. As far as mere picturesqueness goes, the roots have greatly the advantage, but they harbour woodlice and slugs, and are not so well adapted for the growth of dwarf alpine plants as the pockets between the masses of stone. Nevertheless, the roots are admirable for allowing the growth of trailing plants, such as the *Ivies*, the more interesting and ornamental of which might be introduced with great advantage; the trailing *Roses*, the *Vines*, the *Clematis*, the *Brambles*, the *Smilax*, and the very numerous trailing plants never seen to advantage when tied to a stake. In suitable places *Yuccas*, the species of *Cytisus*, the *Cistuses*, the more remarkable of the dwarf *Conifers*, and other effective plants might be employed, always taking care to select such shrubs as will not by their rapid, vigorous growth run away with the rockery, so to speak.

We presume the planting at present is to a large extent merely provisional and temporary—done to secure immediate effect. As the works proceed time will be afforded for the consideration and selection of the most appropriate plants and their disposition in the most suitable places. A grand opportunity is afforded for combining such pictorial dispositions as shall please the eye and satisfy the tax-payer, and, at the same time, fulfil the educational and instructional requirements for which mainly Kew exists. For instance, without any detriment to pictorial effect, it would be possible to have a bay or a mound, or both, devoted to the illustration of the flora of Japan, as represented by such plants as are suitable for cultivation in the rock garden. In another place the North American flora might be represented, elsewhere that of Chili or New Zealand, and so forth.

At present but little attempt is made at the botanical grouping of the plants, and this indeed is difficult to carry out strictly either in conformity with the requirements of the plants themselves, or with their pictorial effect. Nevertheless, wherever it can be done, it would be most

advantageous to do so. To get together in this way the *Primulas*, the *Androsaces*, the *Saxifrages*, the *Heaths*, the hardy terrestrial *Orchids*, the *Gentians*, the *Sedums*, the *Sempervivums*, the *Dianthus*, would not only be feasible, but most valuable for purposes of comparison; while, with a little management, these arrangements for the convenience of students might be so contrived as not to interfere with the general effect of the whole. A little bit of old wall, from whose crannies a few *Pinks* are just struggling, is, though small and only just completed, a most promising bit of garden effect; and even in its present inchoate state is so pleasing, that we only regret there is not more of it. Its lines of dip suggest the possibility of a geological section with its varied strata, its "faults," its conformable and unconformable beds, and so on. It may not perhaps be wise or appropriate to attempt so much, but it would be quite appropriate to have a group here of sand-loving plants, there of limestone plants, and so on. Bog plants, we presume, from the indications already visible, will be provided for, at least on a restricted scale.

Horticulturists and botanists interested in this matter may well congratulate themselves on the great effect produced with so small a grant, and on the rapid progress that has been made. From this point of view the acquisition of the late Mr. JOAD'S collection is most fortunate. The contrast between the formal oblong flat beds of the herbaceous ground is already delightful, and for our own parts we believe that the rock garden can be made quite subservient to the interests of science as well as allow of the cultivation of many plants that cannot be grown on the flat. Suitable niches can be found on the rockery for many plants that perish on the flat from want of shelter or other cause. The contrast with the ordinary herbaceous border, too, with its flat surface and long lines of perennials, tall at the back and dwarf in front, is most pleasing, although, of course, we cannot dispense entirely either with the borders or the beds.

A rock garden of this magnitude entails its own peculiar difficulties. It needs to be overlooked and placed under the charge of a man who is not only a gardener in the technical sense, but a botanist in his knowledge and love of plants. A keen eye to appreciate the requirements of different plants, great patience in trying experiments, unwearied diligence in seeing that the appropriate cultural requirements of different plants are intelligently provided for, and ceaseless anxiety as to correct nomenclature—these are among the essential qualifications for whomsoever has the charge of this department; and in proportion as they are possessed will be the utility of this the newest addition to the ever increasing resources of our great national establishment. A good catalogue, with synonyms and indications of the native country of the plants, should also be prepared later on.

— MR. THOMAS MOORE. — The presentation of a substantial pecuniary gift and a piece of plate to this gentleman took place at a dinner at the Cannon Street Hotel on Tuesday last. The proceedings were of a very satisfactory character, as it was universally felt that Mr. MOORE'S long and disinterested services to horticulture, and his unwearied diligence in promoting the welfare of his brethren, and of horticultural affairs generally, entitled him to the gratitude of the profession. Upon his services to botanical and horticultural literature, his unrivalled knowledge of plants, his impartial judgments as a censor, his special acquirements as an historian of Ferns, it is unnecessary for us to dilate; while it would, under the circumstances, be out of place for us in these columns, wherein for so many years he acted as a loyal colleague and a trusted friend, to do more than mention the many personal qualities, which, moreover, were universally recognised on the occasion in question.

— THE QUEEN IN THE HIGHLANDS. — The room in which HER MAJESTY breakfasted at Perth last week was beautifully decorated with flowers, which included some handsome *Orchids* from Dr. PATERSON, Bridge of Allan, and Mr. JAMES ANDERSON, Meadowbank; *Roses* and *Lilies* of the Valley from Scone Palace, and cut *Roses* from Messrs. JAMES COCKER & SON, Aberdeen. On resuming the journey HER MAJESTY took away with her a basket of *Orchid* blooms sent by Dr. PATERSON.

— CLERODENDRON FALLAX IN SMALL POTS. — There are few plants cultivated in the plant-stove deserving of more attention for ordinary purposes of furnishing, or that impart a brighter tone to an arrangement, even if it is for no higher purpose than the embellishment of the structure named, than the plant above mentioned. Both it and its congener, *C. fragrans*, are very successfully grown by Mr. POPE, gardener at Holmewood, Tunbridge Wells, who grows them from cuttings every spring for autumn decoration. With a little nursing, showy little plants are grown in a few months which will hold their own in point of effect with anything else in cultivation.

— DARWIN MEMORIAL. — Though the works of CHARLES DARWIN are his best and most enduring memorial, it is felt by his many friends and admirers that these should not be the only one. They are desirous of handing down to posterity the likeness of a man who has done so much for the advancement of natural knowledge. They wish also to establish a fund associated with his name, the proceeds of which will be devoted to the furtherance of biological science. A committee has accordingly been formed with a view of raising funds for the above purposes. The hon. secretaries are T. G. BONNEY and P. EDWARD DOVE, Royal Society, Burlington House.

— SINGLE DAHLIAS AMONG RHODODENDRONS. — If people only made the best use of one half of the plants at their disposal much more enjoyment would be derived from gardens of all sizes. Dahlias are planted in single file in narrow borders or wide ones—it matters not which—like as many volunteers at drill, and after the first hurricane that blows in the autumn the disabled plants look in a sorry plight for the rest of the season. Not so, however, if they are planted among *Rhododendrons*, which afford them the necessary protection and shelter. We plant where things ought not to be planted, and we do not plant where things ought to be planted. The effect, too, is something to look at. *Rhododendrons* out of flower are somewhat formal subjects, but with single scarlet, crimson, yellow, and white Dahlias peeping up above them one never tires of looking at them from a distance.

— BEDDING OUT. — An arrangement noticed in Hyde Park last autumn, when the great masses of bedding plants looked practically over for the season, was composed of *Gazania splendens* and *Iresine brilliantissima*, edged with *Alternanthera amœna* and *latifolia* and *Echeveria secunda glauca*. The *Gazania* and *Iresine* have a peculiar shade in the sunlight, and altogether their appearance in an exposed situation would indicate that they are good rough-weather plants for the neighbourhood of the metropolis or elsewhere. Another very good example of muddy fledge bed was composed of *Abutilon Thomsoni*, mixed with green-leaved *Cannas* and *Abutilon* *Boule de Neige*, *Fuchsias*, *Ficus elastica*, and finished off with *Draœenas*, *Centaureas*, *Alternanthera major*, and *Mesembryanthemum cordifolium variegatum*. These are plants which most people possess, and as they are free growers, showy, and last well, the hint may be useful at the present season.

— SCHOOL OF FOMOLOGY AND HORTICULTURE IN FLORENCE. — A school for the instruction of pupils in the theory and practice of all matters relating to the cultivation of fruits and plants in general is about to be established at Florence. Appropriate lecture-rooms and experimental gardens will be provided by the municipality of Florence, and the funds will be provided by that body, the Provincial Council, and the Ministry of Agriculture.

— RELATED DEVELOPMENT IN INSECTS. — Mr. C. V. KILBEY publishes, in the *Proceedings of the*

American Association for the Advancement of Science, a record of several cases of retarded development in insects, arising from a dormant condition during summer of a given brood of caterpillars, the protracted duration of the pupa stage, or the deferred hatching of eggs. Of the latter Mr. RILEY mentions that some eggs of the Rocky Mountains locust (*Caloptenus spretus*), which in the year 1876 were accidentally buried some 10 inches below the surface, hatched in the spring of 1881, when the mould and *debris* by which they had been covered was removed.

snakes; and that no known poison but the Yew produces the "lazar-like" ulcerations on the body upon which SHAKSPEARE lays such stress. Mr. ELLACOMBE, in his *Plant Lore of Shakspeare*, inclines to the view that "Hebenon" is a general term for any strong poison, and we do not suppose the poet troubled himself much about toxicological or botanic detail.

— ISORALEA PINNATA.—Considerable numbers of this old but seldom seen evergreen shrub are grown at

mental tree than the common white Thorn at this season of the year. It would perhaps be difficult to name a spot where the single white form of *Cratægus oxyantha* can be seen to greater advantage just now than in the fine park at Ashton Court, near Bristol. Here there are many fine specimens: some are supposed to be two hundred years of age; they have grown into fine trees, and are literally sheeted with blossoms, consequently they are conspicuous objects at a great distance. What a delicious perfume is exhaled by the scented blossoms. If any one passes

THOMAS MOORE.

— THE HEBENON.—From the *Athenæum* we take the following note of a communication to the Shakspeare Society by Mr. HARRISON, relating to the plant that produces the "juice of cursed Hebenon." Premising that the poison intended must be the same as MARLOWE'S "juice of Hebon," he pointed out that the Yew tree is called Hebon by SPENCER and other writers of SHAKSPEARE'S age; that in its various forms of ebon, eiben, tilben, &c., this tree is so named in no less than five different European languages. He showed by citations from medical authorities that the juice of the Yew is a rapidly fatal poison, that the symptoms in Yew poisoning correspond in a very remarkable manner with those which follow the bites of poisonous

the Ascot Nursery. Its foliage somewhat resembles that of the pinnate-leaved *Boronia*, *B. pinnata*, but the plant attains a much greater size and strength in the thickness of its branches. The flowers are pea-shaped and produced in tufts of from two to half a dozen, on short stalks from the axils of the leaves. The colour is a pale soft blue or lilac, a colour, by-the-way, anything but plentiful amongst greenhouse plants. It usually blooms in the spring, from March to May. It comes from the Cape, consequently requires ordinary greenhouse treatment, and blooms freely in a very small state.

— THORNS IN THE LANDSCAPE.—It would be difficult to name a more charming or highly orna-

to leeward of a tree the rich scent of the Hawthorn is felt to be powerfully present in the atmosphere. GILPIN, who looked upon Nature merely with the eye of a painter, declares the Hawthorn to be anything but a picturesque tree, but his opinion will not be generally shared. It is generally found in parks as isolated specimens, though sometimes in harmonious groups, and in contrast with surrounding trees it appears to possess a marked individuality of its own. At Mr. JOHN WALTER'S splendid seat at Bearwood the common Thorns are now objects of great beauty, and the single crimson Thorn is conspicuously attractive. How finely it is flowering this season at Bearwood, and generally elsewhere. To our mind the double varieties are decidedly in-

ferior to it as decorative trees, and were the single crimson variety introduced now for the first time it would create quite a *furore* in the horticultural world. In the foreground gardens of many of the large villa residences on Clifton Downs the double pink Thorn is flowering grandly, and the position suits it well; but it is an accommodating plant, and if in agreeable soil does well, and invariably blooms freely. PAUL's double crimson Thorn makes a superb tree as a standard, and in point of colour is an exact reproduction of the single pink in a double form. On the terrace garden at Ashton Court Mr. AUSTEN has planted some bush trees of the double crimson Thorn, which are kept pruned back a little to maintain the shape, but the trees flower freely, and are charming objects just now.

— LABURNUMS AND HAWTHORNS PLANTED ALTERNATELY.—There are no flowering trees of a graceful and ornamental character that have a finer effect during the present month than the subjects above-named, both of which are common enough, though hardly as plentiful or as well disposed as could be desired. In the pink and white Hawthorns we have gems of the first water, but unfortunately they are either planted in thick clumps or half-obscured by a big Elm, or something else, not half so pretty as themselves. How many ornamental gardens are there that are enclosed by broad bands of common Laurels which are mere weeds for a conspicuous situation in a good climate, where a background of these lovely trees would be a vast improvement. So many makeshifts have been made in times past which by courtesy used to be or are called ornaments, that there is still abundant scope left for planting flowering and ornamental trees and shrubs, if these flimsy, so-called ornaments were but removed and planted in the woods for cover, where they would be in their proper place. Picture a broad border of Laurels cut or trimmed over every spring, and fancy the same border planted with Laburnums, Hawthorns, Lilacs, Weigelas, Philadelphas, Berberis, Cytisus, Laurustinus, Deutzias, and Rhododendrons, and intermixed with coniferous plants and variegated shrubs, Tree Pæonies, &c.—what a change for the better would be the result. Fancy a band of green Laurels planted for ornament where there is nothing but green to be seen for miles around, while there is such a wealth and variety of flowering trees and shrubs attainable in every town and village in the country.

— FUNGI IN MUD WALLS.—A number of mud-wall houses having been lately pulled down, the walls were broken up and spread over the ground, and with them numerous fragments of wood were buried. Some of them gave fine specimens of *Perisporium vulgare*; but many of the large pieces when broken across showed an intricate mass of perforations, the work of some insect, filled with their dung in the shape of minute pellets of a beautiful magenta-pink tint. As this tint occurs in dead herbaceous stems infested with *Spheria rubella*, and in a more decided shape in the curious *Spheria rhodobapha*, but as the rest of the wood was not at all tinted, the colour seemed unaccountable. A larger piece of wood, however, was dug up at a later date, on which the surface was partly covered by a *Corticium* in an imperfect state, which could not be distinguished from *Corticium anthracinum*; it seemed that the wood was probably impregnated with the mycelium of that fungus, after the fashion of the green wood which is so well known and utilised at Tunbridge, in which the excrements of beetles are of a bright green. As we have not met with this condition of wood before, it seems worthy of being recorded. *M. J. B.*

— TUBEROSES.—To those who do a large business in cut flowers of the best kinds the value of Tuberoses is well known. Colour, perfume, and enduring properties alike make them so desirable that their presence in a first-class bouquet is always an improvement, and so accommodating are the plants, that when due regard is given to the time of potting and starting the bulbs into growth, their season of flowering can be prolonged so as to give a succession over a considerable portion of the year. The Ascot Nursery has always, even from the time of the late Mr. STANBISH, been noted for these beautiful flowers; at the present time immense numbers are grown, and to still further prolong their season they can be had in flower, quantities are planted out in the open ground. The dry bulbs are put in about the end of May in the open quarters, here they make vigorous leaf growth.

They are lifted and potted in September, and placed for a short time in cold pits, kept close, and the soil moderately moist; they are then moved into heat, where the bloom-stems develop, and they keep on flowering for several months.

— EXACUM MACRANTHUM is a native of the mountains of Ceylon, where it is found at an elevation of about 6000 feet above sea-level. It is a fine ornamental plant, belonging to an order—*Gentianaceæ*—which furnishes our gardens with by no means a few showy things. It grows about a couple of feet in height, has large, glabrous, glossy leaves, gradually becoming smaller as the terminal corymbs of handsome dark rich purple blossoms are reached; these measure about 2 inches in diameter, the yellow eye and large yellow stamens forming a striking contrast with the purple of the corolla. In flower in No. 8 house at Kew.

— ENGLISH SEEDS AT PORT ELIZABETH.—We are informed that at the recent great agricultural exhibition held at Port Elizabeth, Messrs. SUTTON & SONS were awarded a Silver Medal for their collection of grasses, seeds, models, &c.

— WHERE TO PLANT SUNFLOWERS.—When the gardening public take a fancy to any particular class of plants, they generally exceed the bounds of good taste and judgment in the use of them. No doubt it is pleasant to feel that one is possessed of a good stock of fashionable plants, and as long as there is plenty of room for their disposal the desire is a laudable one. But Sunflowers are very large, and the colour is a very strong one, so strong that instead of producing a good effect, you simply create a glare by a too free use of them. But there is a place for everything, and so there is for Sunflowers. They are best viewed from a distance, say upon a rocky eminence, planted in front of a row of dark green pines, not too thickly, and above all things, irregularly, so that you never see more than three flowers without looking a second time.

— AN AUTUMN FLOWER-BED.—As most people are now maturing their plans for bedding-out, if they are not actively engaged in the work, it may be useful to suggest how a good autumn effect can be produced out of very ordinary material. A good autumn bed is really a scarce commodity in many country gardens, because every one aims at a spring or summer effect and a good many accomplish both, while a great many more are not successful in selecting and arranging their plants to the best advantage. Two plants that make a grand autumn bed are *Chrysanthemum frutescens* and *Iresine Lindenii*. A bed of this kind looks best isolated, and it should have a commanding position, and if possible it should be where it would be seen from the principal windows of the mansion. The deep glaucous hue of *Chrysanthemum frutescens* contrasts well with the dark *Iresine*, and the flowers of the former are in striking contrast with both. A bed composed of these two plants will look bright and cheerful late in the season, when *Pelargoniums* and such-like are faded and past their best. No amount of rain will mar the effect if it is not accompanied by violent winds, from which the *Chrysanthemum* will require some slight protection if it is planted in an exposed situation.

— PROPOSED JAM MANUFACTORY AT MAIDSTONE.—At a meeting of the committee of the Maidstone Farmers' Club and Chamber of Agriculture held recently at Maidstone, the question of forming a jam manufactory in the county of Kent was considered, and the following gentlemen were appointed to take steps to carry out the scheme, namely:—CHARLES CHAMBERS, Esq., Langley Park, Maidstone; FREDERIC PINE, Esq., Westree, Maidstone; RICHARD A. HAMILTON SEYMOUR, Esq., Aylesford, Maidstone; AMBROSE WARDE, Esq., Tutsham Hall, Maidstone; CHARLES WHITEHEAD, Esq., Farming House, Maidstone. It being acknowledged that the present system of selling fruit is most unsatisfactory, and that the grower does not receive a fair value for his produce, especially in plentiful seasons and when the London markets are glutted by reason of the insufficient means of distribution, it seems most desirable that a jam manufactory should be established, in a central position in this county, that would absorb large quantities of fruit. The consumption of jam is largely increasing, and the profits derived from making it are very great, so that besides materially benefiting the fruit growers it is confidently believed

a manufactory of this kind would yield large returns. It is hardly necessary to say that railway charges, commission, and other incidental expenses would be avoided if the growers had the opportunity of sending their fruit direct to a local factory. In order to develop this project it is proposed, we understand, to form a limited liability company, with a nominal capital of £30,000, divided into 1500 shares of the value of £20 each. Of this capital it is proposed to call up £15,000.

— NEW INSECTS INJURIOUS TO AGRICULTURE.—Mr. C. V. RILEY remarks that almost every year the appearance of some insect or insects injurious to agriculture, but previously unknown in an injurious capacity, has to be recorded. These new destructive species may either be (1) recently introduced species from some foreign country; (2) native species hitherto unobserved or unrecorded, and new in the sense of not being described; or (3) native species well known to entomologists, but not previously recorded as injurious. The author argues that in the last two categories, more particularly, we frequently have to deal with newly acquired habits, and in the second category with newly acquired characters that in many cases systematists would consider of specific value. In short, he believes that certain individuals of a species which has hitherto fed in obscurity on some wild plant may take to feeding on a cultivated plant, and with the change of habit undergo in the course of a few years a sufficient change of character to be counted a new species. Increasing and spreading at the rapid rate which the profligacy of most insects permits, the species finally becomes a pest, and necessarily attracts attention. The presumption is that it could not at any previous time have done similar injury without attracting similar attention—in fact, that the habit is newly acquired. The author reasons that just as variation in plant life is often sudden, as in the "sport," and that new characters which may be perpetuated are thus created; so in insects there are comparatively sudden changes which under favouring conditions are perpetuated. In this way characters which most systematists would consider as specific originate within periods that are very brief compared to those which evolutionists believe to be necessary for the differentiation of specific forms among the higher animals.

— MESSRS. HOOPER & CO.'S NURSERY AT TWICKENHAM.—In this small but fully utilised enclosure, one of the most charming things seen during the past spring was a bed of the pretty *Cyclamen repandum*, that flowered with singular freedom. The light, sandy, yet holding Twickenham soil, admirably suits alpines of this class. *Hepaticas* thrive marvellously. *H. angulosa* is as vigorous as weed, forming a perfect mass of foliage. Double *Pyrethrums* do well, many fine kinds being grown, but the starchy single forms are not favoured. No more striking kind is seen than is *Princesse de Metternich*, for not only is it of a dwarf stout habit, but the flowers are large and pure white. Perennials of many kinds are largely grown, and there is a very interesting collection of alpine plants in pots, notably *Saxifragas* and *Semperviviums* in great variety. Very charming indeed is *Eritrichium nanum*, with its lovely *Myosotis*-like blue flowers. *Silene alpestris* is well known, but when in full bloom irresistibly demands notice. *Campanula Isidoreana* is very much like *garganica*, but larger and earlier. One special purpose of the nursery is to grow small plants in endless variety for the Covent Garden establishment, and there nothing that will carry a flower or two, or has pleasing foliage, seems unobtainable. Within the houses Palms and Ferns are grown in immense quantities to satisfy the requirements of this same alborer; so also are *Gloxinias*, *Crotons*, *Dracenas*, *Begonias*, &c. Mr. BROCKHAUS, the manager, has fashioned from roots of *Davallia* wreaths, crosses, and other designs, and even of wrens, to suspend in windows and conservatories, and these, when fully developed, will be novel yet pleasing. A lot of fine pyramidal double *Ivyleaf Pelargoniums* is being trained to make specimens. The nursery, which occupies what was formerly the site of an old walled garden, and is just behind the Twickenham Railway Station, is difficult to find, but when found invariably repays a visit.

— DWARF PHLOXES AT CHISWICK.—These have been flowering in all their simple and captivating beauty, and their useful service is co-equal with their

charming effect. There are P. setacea and its varieties, and P. subulata and its varieties, and though in the eyes of the botanist there are substantial differences between them, to the onlooker they have a near resemblance, and for our purpose may be conveniently put into one group. There is P. subulata, with its dense spreading habit and pale pink flowers with a dark eye. There is also an unnamed variety with blush flowers and a slight dark centre, distinct from the foregoing and very pretty. P. Nelsoni is well known for its pure white flowers; as a rock plant it has few equals. Another variety has vivid pink flowers with a bright carmine centre, but the deepest coloured form is violacea; this is of a rosy-violet hue, the centre quite dark, and it is very showy and effective. What is growing on the rockwork as P. setacea atropurpurea appears to be identical with violacea. It is noticeable that in the case of one or two of the unnamed varieties, which we presume are sent to Mr. BARRON as seedlings, there is a gradual advance in the way of roundness of pip, circular, stout, and with the colours well defined, looking like a miniature Phlox Drummondii. P. verna, with its bright rosy-coloured flowers, is there also; so is P. stolonifera, pale bluish-mauve, dwarf, and very pretty indeed; and P. divaricata, also of the P. verna type; this is larger in the flower than the preceding, and of a pleasing mauve colour.

EVERGREEN SCREEN HEDGES.—The merits of such plants as Holly, Laurel, Privet, and various others generally used for the purpose in question, are sufficiently known. Well adapted as these are, they all require more or less attention to keep them thick and close in the bottom, and to confine them within bounds, and moreover although slightly and trim in outline as a well kept hedge is, there are some positions where the formal appearance would be better absent. At the north side of the grounds at Bedford Hill House there is a long hedge of tree Box, that forms one of the best screens we have ever seen—high, broad, and impervious to the eye as a wall, with an absence of the even clipped look inseparable from a hedge composed of material that has to be annually subjected to clipping; the Box presents just enough irregularity in surface to prevent formality, and does not grow so quickly as to require more than a limited use of the knife to any strong shoots that may take an undue lead. It may be said that the comparatively slow growth of this shrub is against its use for screen hedges, but it can be had three or four feet high comparatively cheap, and if well done, too, it will grow freely, and in some positions, when once established, a hedge composed of it has a better appearance than anything we have yet seen.

THE LINNEAN SOCIETY.—The anniversary meeting of the Society was held on May 24, the President, Sir JOHN LUBBOCK, in the chair. In the course of his address Sir JOHN briefly reviewed the work and progress of the Society during the year, and alluded to the work done and the additions made to the British Museum, Kew, and other national establishments connected with natural history. The secretaries read a brief review of the principal works and memoirs on zoology and botany published during the year, together with obituary notices of deceased Fellows. The financial condition of the Society is satisfactory, and the increase in the number of Fellows and in those attending the meetings a matter for congratulation. In the evening a dinner was held. The following papers will be read at the meeting to be held on June 1st:—"Results of the Investigations on the Ceylon Coffee-leaf Disease;" by MARSHALL WARD. 2. "Cutaneous Nerve Terminations in Mammals;" by Dr. G. HOGGAN. 3. "Himalayan Ferns;" by H. C. LEVINGE. 4. "Some British Ascidians;" by H. C. SORBY and Professor HERDMAN. 5. "Recent Additions to New Zealand Flora;" by T. KIRK. 6. "Animalcule Allied to Pleuronema;" by F. W. PHILLIPS. 7. "New Comatule;" by P. H. CARTPENTER.

COCHINEAL CULTIVATION IN TENERIFFE.—In consequence of the extended use of aniline dyes, the cultivation of Cochineal in Teneriffe has received a severe check, so much so that a great many growers are reported to be utterly ruined. The result of this, we read in a recent report, has been that considerable attention has been directed to the cultivation of Tobacco. At first this new production gave promise of

a favourable result, there being a fair quantity collected, and the quality approaching to that of the Cuban Tobacco. In consequence of the Spanish Government not fulfilling their promise to purchase the Tobacco crops for a period of three years, the growers found themselves with their warehouses filled without any prospect of a speedy or remunerative sale. This induced them to abandon Tobacco cultivation, and to return to that of Cochineal; but owing to a great fall in prices—below, indeed that limit at which growers find their crops pay—they have since attempted Sugarcane, the proprietors of the plantations having sent a deputation to the island of Madeira to study the making of sugar, treacle, and rum. Although the majority of the growers think that the new production will give an impetus to agriculture, some of the principal persons in experience and knowledge doubt whether this cultivation will give good results, on account of the high price of land, while labour is dearer than in those countries where this article is usually produced. The cultivation of the Almond is yearly falling off, on account of the indolence of the growers, who do not take the least care of the trees already planted, and never think of planting new ones. Within the last two years the cultivation of the Banana has considerably increased, and may now be considered as an article of export which is gradually increasing.

NEW FLORAL VASE.—Under this designation Mr. S. JOHNSON, The Royal Nurseries, Ascol, exhibited at South Kensington on Tuesday last a new design in ornamental flower-pots. These pots are manufactured in various sizes for taking pots with growing plants of differing dimensions. They are manufactured of ordinary potter's clay, painted white in the inside, and of any colour on the outside, according to the taste of the decorator, and then glazed; the rims are gilded, and the base of the pot, to which a wider base is added, is gilded also; and then, fronds of natural Fern, Selaginella, or Palms, or any suitable plant, which have been prepared for the purpose, are laid on the surface of the side, and securely fixed in position by the use of some adhesive material. If handled with ordinary care, the fronds, &c., will last in proper condition for a long time, and no moisture can pass through the sides of the pots and loosen what is laid on the exterior surface. These pots are intended for sitting-rooms, &c., and they can be manufactured at a cost which will admit of their being sold at comparatively moderate prices.

THE WEATHER.—General remarks on the temperature, rainfall, and duration of bright sunshine, for agricultural and sanitary purposes, during the week ending May 25, issued by the Meteorological Office, London:—The weather was exceedingly fine and dry during the greater part of the week, but after Sunday the 21st it became cloudy and unsettled. On the 22d thunderstorms were experienced over the inland parts of England and Ireland. The temperature has been above the mean in "Scotland, W." and "Ireland, N.," but a little below it in all other districts. The maxima which slightly exceeded 70° in most places, but reached 76° at Nairn, were registered on the 18th in the northern parts of the country, and on the 21st or 22d in most other districts. The minima occurred during the early part of the period, and on the morning of the 16th or 17th the sheltered thermometer fell below freezing-point at York, Durham, Hillington, Bawtry, Cheadle, Churchstoke, and Blackpool, while the ground frosts were reported from many other places. The rainfall has been less than the mean in all districts. In "Scotland, E." and "England, N.E." there has been none at all. Bright sunshine has been very general, the percentages ranging from 62 in the Midland Counties to 79 in "England, E." At York and Geddston the number of hours exceeded 50 per cent. of the possible duration. Depressions observed:—During the first half of the week an anti-cyclone covered nearly the whole of Britain, and the winds were exceedingly light and variable, except in the extreme south, where they were east. On Friday, the 19th, the anti-cyclone began to move away towards Scandinavia, and decided east or south-east winds spread over the country, but no definite depression made its appearance until Sunday, when disturbances commenced to advance towards our south-west coasts. On Monday the distribution of pressure was becoming somewhat irregular.

GARDENING APPOINTMENTS.—Mr. JAMES MACK has succeeded Mr. O. THOMAS as Gardener to Sir ROBERT PEEL, Bart., at Drayton Manor, Tamworth, Staffordshire. Mr. JAMES FORREST, Foreman, Kelly House, Wenys Bay, has been appointed Gardener to JOHN GRAHAM, Esq., of Skelmorton Castle, Ayrshire.—Mr. JOHN LONDON, late Gardener to J. R. GROVE, Esq., The Cedars, Doe Bank, Sutton Coldfield, and formerly of Clarendon, North Wales, has succeeded Mr. BURCH as Gardener at Wording Hall, Preston, Lancashire.

HOME CORRESPONDENCE.

Perennial Candytufts.—*Iberis superba*, described at p. 592, and that referred to by "A. D." on p. 643, we have no doubt are identical. It was raised in our nurseries and sent out under that name ten or twelve years ago, and being, as you say, "a superior form of sempervivens, with larger and better formed flowers," it has with us entirely taken the place of sempervivens. To succeed *I. superba* we find none equal to *I. corifolia*, which flowers about three weeks later. *I. Garreixiana* grows freely but produces very few flowers. On one patch 2½ feet square there are only twenty small heads of flowers, being a marked contrast to the others, which are full of flower. *I. glaberrima* is not hardy. *I. Tenoreana* is very pretty and dwarf, but with us it is only a biennial, and is reproduced from self-sown seed. The perennial Candytufts are so useful in spring that we have been trying for many years by hybridising and selecting to produce improved forms, and although we have certainly obtained several superior to *superba*, still the improvements were not to our mind sufficient to warrant us naming them. The accompanying flowers are from a seedling we consider such a decided advance that it deserves to be propagated. (Cutting.) It is perfectly hardy; indeed they are all growing in the same rockery in our Filzig Nurseries. *Dickson & Co.*

Lewisia rediviva.—This remarkable plant opened its two first flowers on my rockery on May 16. I have four specimens, two of which were planted in the autumn of 1880, and two in the autumn of 1881. They were obtained from North America. The plant consists of a small tuft of leaves, resembling those of a *Mesembryanthemum* or a magnified *Sedum rupestre*. These are quite hidden by the large flowers, fully 4 inches across, resembling the buds of a *Cactaceæ* of a pale rose colour. Of my older specimens the one now in flower, which flowered last year, has eight visible buds on one head; the other has made four heads, each with three or four buds. The two which were planted last autumn are less forward, but intend to flower. All are planted on an upper ledge of a limestone rockery, with an exposed south-eastern aspect, in rich, open soil, with pebbles the size of Peas covering the surface. They all seem quite healthy and happy. I may add that I water them daily in such weather as this. *C. Wollsy Dot, Edge Hall, Malpas, May 19.*
